ENERGY RESEARCH ABSTRACTS

ABOUT THE OFFICE OF SCIENTIFIC AND TECHNICAL INFORMATION

The Department of Energy's Scientific and Technical Information Program (STIP) is carried out at many levels within the Department and by its contractor organizations. The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction and leadership for STIP and serves as DOE's national center for scientific and technical information management and dissemination. Both DOE-originated information and worldwide literature regarding advances in subjects of interest to DOE researchers are collected, processed, and disseminated through an energy information system maintained by OSTI. The major data bases in this system are available within the United States through commercial on-line systems and to those outside the United States through formal governmental exchange agreements. The current-year records for the major data bases, plus a number of specialized data bases are available to DOE offices and contractors through OSTI's Integrated Technical Information System (ITIS). ITIS also serves as a gateway to other government and commercial systems and provides information merging for customized information products. To manage DOE's information resources effectively, DOE's Scientific and Technical Information Program is one of continual development and evaluation of new information products, systems, and technologies.

ABOUT *ENERGY RESEARCH ABSTRACTS*

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports, journal articles, conference papers and proceedings, books, patents, theses, and monographs originated by the U. S. Department of Energy, its laboratories, energy centers and contractors. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations. **The user should remain aware that *ERA* coverage of non-report literature is limited to that generated by Department of Energy activity.**

ERA is comprehensive in its subject scope, encompassing the DOE's research, development, demonstration, and technological programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

ERA is available to the public on a subscription basis from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The subscription rate for the 24 semimonthly issues is $146.00 for domestic subscribers and $182.50 for foreign subscribers. A single issue costs $14.00 (domestic) or $17.50 (foreign). The cumulative indexes will be available in printed form from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The GPO Stock Number is 061-000-00703-2 and the price is $125.00 for the Volume 12 indexes. The cumulative indexes are also available in microfiche form from the National Technical Information Service, U. S. Department of Commerce, Springfield, VA 22161.

Office of Scientific and Technical Information

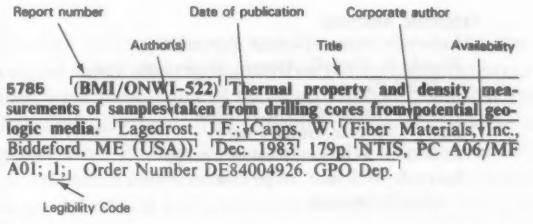
HOW TO USE *ENERGY RESEARCH ABSTRACTS*

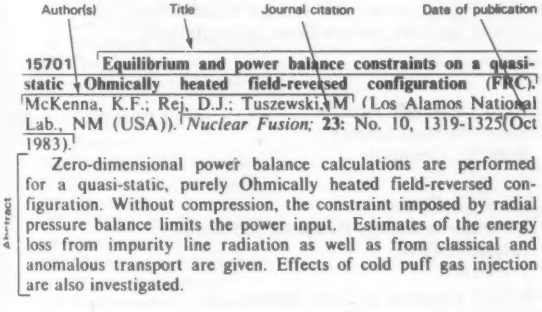
ABSTRACTS IN *ENERGY RESEARCH ABSTRACTS*

The principal elements of abstract entries for a typical research and development report and a typical technical journal article are illustrated below.



5785 (BMI/ONWI-522) Thermal property and density measurements of samples taken from drilling cores from potential geologic media. Lagedrost, J.F.; Capps, W. (Fiber Materials, Inc., Biddeford, ME (USA)). Dec. 1983. 179p. NTIS, PC A06/MF A01; 1; Order Number DE84004926. GPO Dep.

Density, steady-state conductivity, enthalpy, specific heat, heat capacity, thermal diffusivity and linear thermal expansion were measured on 59 materials from core drill samples of several geologic media, including rock salt, basalt, and other associated rocks from 7 potential sites for nuclear waste isolation. The measurements were conducted from or near to room temperature up to 500°C, or to lower temperatures if limited by specimen cracking or fracturing. Ample documentation establishes the reliability of the property measurement methods and the accuracy of the results.



15701 Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC). McKenna, K.F.; Rej, D.J.; Tuszewski, M. (Los Alamos National Lab., NM (USA)). *Nuclear Fusion;* **23**: No. 10, 1319-1325 (Oct 1983).

Zero-dimensional power balance calculations are performed for a quasi-static, purely Ohmically heated field-reversed configuration. Without compression, the constraint imposed by radial pressure balance limits the power input. Estimates of the energy loss from impurity line radiation as well as from classical and anomalous transport are given. Effects of cold puff gas injection are also investigated.

INDEXES TO *ENERGY RESEARCH ABSTRACTS*

Five indexes are provided for approaching the contents of each issue of *Energy Research Abstracts (ERA).* Each index is preceded by an introduction that details the organization of the index and the principles by which it was compiled. The reader is referred to these introductions for information not found in the index examples that follow.

• Corporate Author Index

Technical report literature is indexed using the name of the organization or institution responsible for the issuance of the report.

5785 (BMI/ONWI-522) Thermal property and density measurements of samples taken from drilling cores from potential geologic media. Lagedrost, J.F.; Capps, W. **(Fiber Materials, Inc., Biddeford, ME (USA)).** Dec. 1983. 179p. NTIS Order Number DE84004926. GPO Dep.

is indexed as:

Fiber Materials, Inc., Biddeford, ME (USA)

• Personal Author Index

Each author's name is indexed in the form appearing on the document abstracted, with the exception that given names are reduced to initials:

Capps, W., *See* Lagedrost, J. F.
Lagedrost, J.F., Thermal property and density measurements of samples taken from drilling cores from potential geologic media, 9:5785 (R;US)
McKenna, K.F., Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC), 9:15701 (J;US)
Rej, D.J., *See* McKenna, K.F.
Tuszewski, M., *See* McKenna, K.F.

• Subject Index

The subject index consisting of entries naming specific materials, objects, and processes is arranged alphabetically. Document titles, informative phrases, or both specific to these entries are arranged alphabetically under the entries.

SALT DEPOSITS
Density
Thermal property and density measurements of samples taken from drilling cores from potential geologic media, 9:5785 (R;US)
REVERSED-FIELD PINCH
Energy Balance
Equilibrium and power balance constraints on a quasi-static Ohmically heated field-reversed configuration (FRC), 9:15701 (J;AT)

• Contract Number Index

DOE technical report literature is indexed using contract numbers. This index contains the contract number with corresponding abstract and report numbers.

AC06-76RL01830	**Fiber Materials, Inc., Biddeford, ME (USA)**	
	9:5785	BMI/ONWI-522

• Report Number Index

Technical report literature is also indexed using report numbers. This index includes information on where individual reports may be obtained. Patents and conference papers are indexed here as a matter of convenience. When a report is supplied under an Order Number, that number is included in the availability statement. An Order number–report number correlation is included for convenience.

BMI/ONWI-522	9:5785	NTIS, PC A09/MF A01. Order Number DE84004926, Distribution Category MN-70

Communication concerning the editorial policy and content of *Energy Research Abstracts* should be addressed to the Editor, *Energy Research Abstracts,* Office of Scientific and Technical Information, P. O. Box 62, Oak Ridge, TN 37831.

SUBJECT CONTENTS (NUMERICAL LISTING)

Six-digit subject category numbers are used in the storage, retrieval, and manipulation of bibliographic information entered into DOE's computerized bibliographic information system. The six-digit category numbers are utilized as if they were three pairs of two-digit numbers, the first two pairs being used to arrange the abstract content of *Energy Research Abstracts*. The following listing includes the totality of the 40 first-level and 289 second-level subject categories used. Because each issue of *ERA* announces only those documents becoming available during a semimonthly period, some subject categories may not be represented in every issue. The complete subject category scheme with scope definitions and limitations is available as DOE/TIC-4584-R6 from NTIS for $9.50.

35547 **(DOE/METC—88/6083) Technology transfer program at the Morgantown Energy Technology Center: FY 87 program report.** Brown, W.A.; Lessing, K.B. (USDOE Morgantown Energy Technology Center, WV). Oct 1987. 101p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88001005/JAW.

The Morgantown Energy Technology Center (METC), located in Morgantown, West Virginia, is an energy research center of the US Department of Energy's (DOE's) Office of Fossil Energy. The research and development work is different from research work conducted by other Government agencies. In DOE research, the Government is not the ultimate "customer" for the technologies developed; the "customer" is business and industry in the private sector. Thus, tehcnology transfer is a fundamental goal of the DOE. The mission of the Fossil Energy program is to enhance the use of the nations's fossil energy resources. METC's mission applies to certain technologies within the broad scope of technologies encompassed by the Office of Fossil Energy. The Government functions as an underwriter of risk and as a catalyst to stimulate the development of technologies and technical information that might otherwise proceed at a slower pace because of the high-risk nature of the research involved. The research programs and priorities are industry driven; the purpose is to address the perceived needs of industry such that industry will ultimately bring the technologies to the commercial market. As evidenced in this report, METC has an active and effective technology transfer program that is incorporated into all aspects of project planning and execution. Technology transfer at METC is a way of life—a part of everyday activities to further this goal. Each person has a charge to communicate the ideas from within METC to those best able to utilize that information. 4 figs., 20 tabs.

35548 **(DOE/PC/79919—2) Flotation and flocculation chemistry of coal and oxidized coals: Technical progress report, December 15, 1987 to March 15, 1988.** Somasundaran, P. (Columbia Univ., New York (USA)). 1988. Contract FG22-87PC79919. 11p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011158/JAW.

The results of film flotation are shown in Fig. (3). Film, flotation gives information analogous to the Tromp curve in float sink experiments. It has been established by Fuerstenau and co-workers that the results of film flotation are dependent on the surface characteristics of the coal. This curve is also analogous to the Zisman plot of cos O vs surface tension of a homologous series of liquids used for measuring the respective contact angles. Points on the film flotation curve represent the critical wetting surface tension of various moieties on the surface of coal. Analysis of results of Film flotation of base coal and PAM treated coal show that increase in PAM concentration renders the coal surface more hydrophilic. Different moieties on the coal surface adsorb PAM to different extents. At around 32% to 40% methanol it is observed that adsorption of PAM in the concentration range 7 to 14 ppM is reversed resulting in a relatively more hydrophobic surface. It is proposed to refine the film flotation technique as a method to study the nature of adsorption of various reagents proposed. This is essential since this technique enables the study of the effect of heterogeneity on various surface interactions. Experiments are also planned to investigate if the response to Film flotation characterizes the total surface or the surface of an individual particle. 6 refs., 3 figs.

35549 **(ORNL—6459) Impact of biotechnology on coal processing.** Lee, D.D.; Scott, C.D. (Oak Ridge National Lab., TN (USA)). May 1988. Contract AC05-84OR21400. 71p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88011234/JAW.

There is increasing interest in the application of biotechnology to the coal industry. The bioprocessing systems that have been proposed or that can be envisioned for the future involve all aspects of coal utilization. These include beneficiation of coal for the removal of sulfur and other heteroatoms, modification of coal properties, solubilization or liquefaction of coal, conversion of by-product gases to liquid fuel, single- or two-stage microbial gasification, in situ processing of coal, liquid products upgrading by heteroatom removal, wastewater treatment to remove organics and inorganics, heavy metal removal from wastewater, heteroatom removal from gaseous products or off-gas by immobilized microorganisms, stabilization of coal processing residues, and product spill cleanup. It was found that the only areas where considerable research has been done are in wastewater treatment and pyrite removal. The other areas have not been studied in enough detail to provide adequate information for even preliminary process designs, and, in some cases, the proposed applications are entirely speculative. Much additional research and development will be required before proper process considerations can be made, but the potential benefits would be well worth the effort. 228 refs., 7 tabs.

35550 **(STEV-TORV—88-2) Polyelectrolytes and dewatering of peat.** Alden, L. (Statens Energiverk, Stockholm (Sweden)). Sep 1987. 35p. (In Swedish and English). NTIS (US Sales Only), PC A03. Order Number DE88752969/JAW.

The success of artificial mechanical peat dewatering depends mainly on the behaviour of suspended particles in the peat. The suspended particles less than 10 /my/m are transported with the water and will clog the drainage passages. Polyelectrolytes, which bind the peat particles to larger aggregates and form a porous structure, enhance the dewaterability drastically. Surface load, wire cloth size, pressure application, start moisture content and predrainage have a crucial impact on the result. The relation between these factors are not satisfactory examined. These factors need to be further investigated in order to establish a good dewatering process design. The pressure application should be performed first by a low pressure step to reach a dry solid content of 15-18% followed by a high pressure step. Both cationic and anionic polyelectrolytes increase the dewatering rate substantially in particular for highly humified peat. The cost of polyelectrolyte treatment is 3-8 USD/ton dry peat.

35551 **(VTT-TUTK—494) Artificial dewatering of peat. Part 2. The structure of Finnish peat and its influence on water retention.** Aho, M.; Laiho, R.; Tummavuori, J. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Aug 1987. 60p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752875/JAW.

The water binding properties of peat were studied with six peat samples from two peat production areas in Finland. The samples represented the two main types of Finnish peat, Sphagnum and Cares. The degree of humification varied. The most important physical and chemical properties and the water binding properties of the samples were measured and compared. Several different methods of analyzing peat were evaluated during the course of the study. The water retention capacities measured for the samples varied strongly with the dewatering procedure. For example, despite the large water retention capacity measured for the ErS peat in matric suction experiments, it was dried more effectively than the other ErS peats by pressing. A direct connection between

water retention capacity and the physical and chemical properties was thus difficult to establish. Pressing without the addition of a flocculant was the most effective dewatering method for low-humified peats with large mean particle size and low carbon content. The effect of pressing on Sphagnum peat samples could be predicted from the infrared spectra. Medium and highly humified peats were more effectively dried by water suction suggesting that the methods may complement each other. If a flocculant is not used, water suction drying would seem to give slightly higher dry peat contents than pressing. Thermal drying experiments involving low-temperature thermogravimetry revealed that the direct water binding forces in the samples did not differ appreciably in the range 10-50% dry peat per weight. However, pressing reduced the water binding forces, showing that differences in water binding properties are mainly attributable to structural factors, such as particle size distribution and porosity. On the whole, Carex peats were more easily dewatered than Sphagnum peats.

35552 **(VTT-TUTK—501) Artificial dewatering of peat. Mechanical dewatering.** Pirkkonen, P.; Luukkainen, V-M. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Oct 1987. 144p. (In Finnish). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88753002/JAW.

The capability of a screen belt press to remove water especially from Finnish well decomposed peat was researched in this study. The most important result was obtained when well decomposed peat fed as slurry was dewatered by a production scale mechanical screen belt press to a moisture content of 30%. The capacity of the press was 400 kg DS/hm. This result was obtained by combining several treatments which promote water release. The most important treatments were the use of a thick slurry (dry solid content >10%), the use of an anionic flocculation chemical (dosage <1 kg/t dry solids) and the preheating of the slurry. It is possible to obtain an even higher capacity without decreasing the dry solid content of the pressing cake because the velocity of the belt was only 5 m/min. It already approached a commercially profitable pressing process. A dry solid content of 35% was obtained by a high pressure production scale screen belt press but the capacity remained at 300 kg DS/hm due to damage to the device. The water release from peat can be promoted by large particle size of peat, feeding of peat without slurrying, control of acidity of peat, peat freeze-thaw treated, long pressing time, pressing cake is crushed, slurry is predewatered by a suction system. The effects of these factors have been illustrated in the literature review, where the devices used in the mechanical dewatering of peat are also presented. The experimental part presents the results of pressing trials, carried out both by a laboratory scale piston press and by production scale screen belt presses. Viable treatments of finnish peat for belt presses were sought for using piston pressing. A combination of several treatments in order to promote water release from peat were studied for the first time in Finland in runs on a production scale.

35553 **Selective flocculation of fine coal.** Krishnan, S.V. (Battelle Labs., Columbus, OH (US)). pp 160-178 of Fine coal processing. Mishra, S.K.; Klimpel, R.R. Park Ridge, NJ; Noyes Publications (1987).

Coal currently represents one of the largest energy resources in the world. If properly prepared it may be utilized to reduce dependence on oil and lower total energy costs. Historically, coal has been cleaned by separating the carbonaceous fraction from the ash-forming mineral matter (including pyrite) by gravity-based methods and/or flotation. However, deashing of coal by these physical methods is limited. The ash components must be liberated from the coal prior to separation. High ash removal levels require fine (minus 48 mesh) to ultrafine (minus 200 mesh) grinding. Conventional and advanced physical beneficiation processes are, generally, inefficient in terms of Btu recovery, or too expensive for use with ultrafine coal. An effective and inexpensive process in needed for cleanup of fine and ultrafine coals. The need for cleaning and recovery of fine and ultrafine coal fractions has increased in recent years. This results from a desire to replace oil by very low ash, coal-water mixtures (CWMs[, to improve the overall Btu recovery of preparation plants, to reduce the environmental concerns associated with burning coal, and recover coal values traditionally lost with coal wastes. An advanced physical separation technique that appears to economically address the current need is selective flocculation. This technique is being increasingly recognized as one of the more promising new separation technologies for the processing of fine and ultrafine materials. Selective flocculation makes use of the differences in the surface chemical characteristics of the coal and the ash mineral particles, bringing about a separation between the two types of materials with the aid of selective polymeric flocculants. This chapter examines the fundamentals of the selective flocculation process and discusses the results of some of the relevant studies that have been carried out to date.

35554 **Oil agglomeration process for the treatment of fine coal.** Steedman, W.G.; Krishnan, S.V. (Battelle Labs., Columbus, OH (US)). pp 179-204 of Fine coal processing. Mishra, S.K.; Klimpel, R.R. Park Ridge, NJ; Noyes Publications (1987).

Fine particles in liquid suspension can be agglomerated and recovered in a number of ways. The use of electrolytes to reduce the zeta potential, thereby allowing colliding particles to cohere, and the use of polymeric flocculants to bridge between particles are two such methods. A third method, and the subject of this chapter, is the addition of an immiscible liquid to the suspension to cause adhesion of the particles by capillary interfacial forces. Typically, the immiscible liquid used is an oil; the technique is therefore known as oil agglomeration or selective oil agglomeration. Oil agglomeration relies upon differences in the surface properties of the organic and inorganic particles to effect separation. The carbonaceous constituent of fine coals can be agglomerated from aqueous suspensions using a wide variety of oils as the collecting liquid. Inorganic constituents normally remain in suspension and are rejected. The technique is well-suited for the processing of fine coal because its performance does not diminish with extremely fine coals as does froth flotation. The technique also can be used successfully in the presence of clay slimes. This chapter presents the principles and process description of oil agglomeration, and discusses the impact of important process variables on its performance. Also included is an overview of past and current applications of the technique and a discussion of process economics.

REFER ALSO TO CITATION(S) 35549, 35584, 35588, 35625, 35638, 35700, 35700, 35997, 35998, 37290, 37290

35555 **(BNL—40900) Enhancement of coal quality by microbial demetalization and desulfurization.** Olson, L.J.; Chetty, A.; Chhabria, S.P.; Karohl, D.A. (Massachusetts Inst. of Tech., Brookhaven, NY (USA). School of Chemical Engineering Practice-Brookhaven Station). May 1986. Contract AC02-76CH00016. 100p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88008835/JAW.

The removal of metals from coal improves quality by reducing the ash content and possibly altering the ash fusion temperature, which reduces fouling of combustion equipment. This study characterized the demetallization and desulfurization of coal catalyzed by the bacterium Thiobacillus ferrooxidans, and estimated the economic feasibility of a commercial-scale microbial coal-benefication process. The effects of slurry concentration, coal type, particle size, temperature, degree of agitation, nutrient concentration, and CO_2 concentration on the rate and extent of metal and sulfur solubilization by Thiobacillus ferrooxidans were investigated in lab-scale batch experiments. Thiobacillus ferrooxidans greatly enhanced the extent of sulfur and iron leaching from the three coals tested, slightly enhanced aluminum leaching, but did not improve the leaching of Mg, Na, or Ca. The fractional amount of each metal removed increased with decreasing slurry concentration, perhaps due to insufficient mixing by the mechanical shakers. After 16 days, the maximum amount of inorganic sulfur removed was 79% while the maximum amount of iron removed was 45%. Ash content was reduced significantly for all three coals tested. Pittsburgh coal displayed a 27% reduction in ash content with bacteria present. The hemispherical ash fusion temperature increased between 150 F and 450F due to bacterial leaching for two types of coal. The proposed coal benefication process, to be located at a new 500-MW utility in Ohio, incorporates a 20% slurry and achieves 90% inorganic sulfur removal. An estimated total capital cost of $27 million and an estimated operating cost of $26 million per year yield a total cost of

$9.58ton of coal treated. This total cost is highly sensitive to the annual operating cost and compares favorably with other proposed coal desulfurization processes. 26 refs., 21 figs., 36 tabs.

35556 **(CONF-880770—1-Draft) Conversion of coal to liquids and gases by advanced bioprocessing systems.** Scott, C.D.; Faison, B.D. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 17p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011829/JAW.

From Coal - targets of opportunity workshop; Washington, DC, USA (12 Jul 1988).

A bioprocess can be defined as the directed and controlled use of living organisms or their products to bring about desired chemical and/or physical change. Because of their specificity, bioprocesses can be used to separate a product or contaminant from mixtures or to convert a component of a mixture to a useful product at mild operating conditions. There are an increasing number of concepts that are being considered for use in the processing of fossil fuels, particularly for coal. These include coal preparation technologies such as beneficiation; conversion of coal to useful liquid or gaseous products; product upgrading with removal of detrimental and hazardous components; and environmental control technology for gaseous, liquid, and solid effluents. The conversion of coal to liquids and gases is of specific interest, since the mild operating conditions of biological processes would be very attractive when compared to the rather severe chemical and physical process environment needed for the thermal/chemical conversion of coal. Research results on the biological conversion of coal are summarized and the potential impact of this evolving technology is assessed.

35557 **(CRIE-T—86082) Evaluation of creep-fatigue strength properties of a single crystal superalloy.** Matsubara, Masaaki; Nitta, Akihito. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Aug 1987. 30p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752535/JAW.

For an increase in the efficiency of gas-steam combined cycle power plants, it is necessary to develop high-strength, heat-resistant alloys to be used as material for high-temperature apparatus including stationary and moving blades for gas turbines. Under such circumstances, attention is currently focused on single crystal superalloys. This report deals with a study on high-temperature properties of a single crystal superalloy, which represent an important factor in developing practical material. The dependence of creep rupture strength on crystal structure is investigated in detail. A fatigue test under continuous tensile stress shows that the failure life decreases with increasing stress application time. The failure life does not vary with strain profile when the frequency is the same. Under controlled stress, the high-temperature fatigue strength is found to depend on the crystallographic orientation. It is also be found that the damage to the surface of fatigue test samples is affected by the strain profile and that secondary dendrites have effects on the fatigue strength. (25 figs, 5 tabs, 5 refs)

35558 **(DOE/MC—23075-2555) Measurement and modeling of advanced coal conversion: 5th quarterly report, October 1, 1987 to December 31, 1987.** Solomon, P.R.; Hamblen, D.G.; Serio, M.A.; Smoot, L.D.; Brewster, S. (Advanced Fuel Research, Inc., East Hartford, CT (USA); Brigham Young Univ., Provo, UT (USA)). Mar 1988. Contract AC21-86MC23075. 183p. NTIS, PC A09/MF A01;1; GPO Dep. Order Number DE88001057/JAW.

The overall objective of this program is the development of predictive capability for the design, scale up, simulation, control and feedstock evaluation in advanced coal conversion devices. This technology is important to reduce the technical and economic risks inherent in utilizing coal, a feedstock whose variable and often unexpected behavior presents a significant challenge. This program will merge significant advances made at Advanced Fuel Research, Inc. (AFR) in measuring and quantitatively describing the mechanisms in coal conversion behavior, with technology being developed at Brigham Young University (BYU) in comprehensive computer codes for mechanistic modeling of entrained-bed gasification. Additional capabilities in predicting pollutant formaton will be implemented and the technology will be expanded to fixed-bed reactors. The foundation to describe coal-specific conversion behavior will be AFR's Functinal Group (FG) and Devolatilization, Vaporization, and Crosslinking (DVC) models have demonstrated under previous and on-going METC sponsored programs. These models have demonstrated the capability to describe the time dependent evolution of individual gas species, and the amount and characteristics of tar and char. The FG/DC models will be integrated with BYU's comprehensive two-dimensional reactor model, PCGC-2, which is currently the most widely used reactor simulation for combustion or gasification. The program includes: (1) validation of the submodels by comparison with laboratory data obtained in this program, (2) extensive validation of the modified comprehensive code by comparison of predicted results with data from bench-scale and process scale investigations of gasification, mild gasification and combustion of coal or coal-derived products in heat engines, and (3) development of well documented user friendly software applicable to a "workstation" environment.

35559 **(DOE/MC/21063—2567) A 32-month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized bed gasification system: Quarterly report, October 1-December 31, 1984.** (KRW Energy Systems, Inc., Madison, PA (USA)). Aug 1987. Contract AC21-84MC21063. 130p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88001066/JAW.

Technology development at the Process Development Unit (PDU) in Waltz Mill, PA, has shown that the pressurized, ash-agglomerating fluidized-bed coal gasification process developed by KRW Energy Systems Inc. is an economically attractive coal conversion technology. Long duration testing has demonstrated high carbon conversion, and extensive environmental characterization of PDU effluents has shown that all PDU wastes can be economically and safely disposed. This fluidized-bed technology has been evaluated in the PDU, having a nominal air-blown feed rate of 15 tons per day, and in a full scale cold model to provide the necessary design models and scaleup design correlations. The KRW technology serves as the foundation for the current DOE development contract which focuses on hot gas cleanup and combined cycle generation and provides for the development of two complementary and novel hot gas cleanup technologies: in-bed desulfurization and external desulfurization. The DOE Morgantown Energy Technology Center (METC) pioneered the development of the external desulfurization process which is now being scaled for demonstration at the PDU. External hot gas cleanup design work is underway at KRW as discussed in Section 3.0. Testing at the PDU continued with completion of mechanistic test TP-035-5 in December 1984, which commissioned a two-stage L-valve fines recycle configuration with a tertiary non-recycle cyclone downstream. An assessment on the design basis for a multiple-jet configuration in the KRW cold flow scaleup facility (CFSF) and large-scale commercial units was completed and is presented herein. 67 refs., 32 figs., 14 tabs.

35560 **(DOE/MC/21063—2571) A 32-month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized bed gasification system: Quarterly report, April 1-June 30, 1985.** (KRW Energy Systems, Inc., Madison, PA (USA)). Feb 1988. Contract AC21-84MC21063. 118p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88001073/JAW.

The design report for the KRW external hot gas cleanup system is in progress. The second air-blown gasifier PDU test for evaluation of in-bed desulfurization was completed. Gasifier operability with in-bed desulfurization was demonstrated by successful operation of the PDU. This success was attributed to improved operation of the dolomite feeder, operational flexibility of the modified ash annulus gas distributors, and specific gasifier startup and transition strategies. The solid wastes discharged from the PDU gasifier during in-bed desulfurization testing include a mixture of agglomerate ash and spent sorbent. The spent sorbent (calcium sulfide) can be converted to calcium sulfate during the in-bed desulfurization process. This is a chemical reaction which minimizes the reactive waste's hazardous properties. Disposal studies and characterization of the PDU reactive wastes were initiated. In addition, process performance was analyzed in terms of gasification rate and

product gas composition for selected PDU tests. Work continued to develop process models to enhance predictions of gasifier performance. An evaluation of PDU test data (1983 to 1985) is in progress to compare PDU fines collection and recycle performance based on isokinetic solids measurements versus predicted values. Preliminary results suggest that further reductions in fines loss can be achieved at the PDU by modifying the geometry of the secondary cyclone.

35561 **(DOE/MC/21063—2572) A 32-month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized bed gasification system: Quarterly report, April 1-June 30, 1986.** (KRW Energy Systems, Inc., Madison, PA (USA)). Feb 1988. Contract AC21-84MC21063. 131p. NTIS, PC A07;3. Order Number DE88001074/JAW.

The scope of work at KRW Energy Systems, Inc. (KRW) under the current contract consists, in part, of designing and installing an external hot gas cleanup system for testing in the Process Development Unit (PDU) at Waltz Mill, PA. This system comprises an external fixed-bed desulfurizer of zinc ferrite sorbent with a sintered metal filter system and associated hot piping and instrumentation. Document FE-21063-40 reports progress on PDU modifications completed on the external hot gas cleanup system (HGCU), and it specifically discusses the safety reviews and safety issues completed for this system. Zinc ferrite sorbent was procured, received and loaded into the fixed-bed desulfurizer. The sintered metal filter was successfully tested in the PDU for 230 hours with no operational upsets during in-bed desulfurization test, TP-036-5. These test results are reported herein, along with metallographic analyses from the Argonne National Laboratory on the failed filter elements retrieved from PDU test TP-036-4. PDU modifications, a test summary, test accomplishments, and set point data for test TP-036-5 are reported as part of the Advanced In-Bed Gas Cleanup Program under the contract. Process analyses continued on analyzing existing data for inclusion in the mechanistic gasifier model to enable improved prediction of gasifier performance. Fines recycle analyses also continued to better understand fines loss and fines elutriation and enable evaluation of cyclone performance. Advanced system design work was completed on regenerated sulfur dioxide, external sulfation, and advanced instrumentation for the External Hot Gas Cleanup Program.

35562 **(DOE/MC/21063—2577) A 32-month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized bed gasification system: Quarterly report, July 1-September 30, 1985.** Cherish, P.; Haldipur, G.B.; Lewandowski, D.; Lucas, J.L.; Katta, S.; Kim, S.S.; Kettering, E. (KRW Energy Systems, Inc., Madison, PA (USA)). Jan 1988. Contract AC21-84MC21063. 190p. NTIS, PC A09/MF A01;1; GPO Dep. Order Number DE88001082/JAW.

KRW Energy Systems Inc. completed installations of its external hot-gas-cleanup (HGCU) system at the Process Development Unit at Waltz Mill, PA. Two external-bed desulfurization tests were conducted on this system. An evaluation of filter performance during in-bed and external-bed desulfurization testing was completed, and filter modifications were identified as follows: increase blowback pulse flow to enable continuation of TP-037-2 and redesign the filter internals to incorporate eight additional filter elements for future testing. In-bed desulfurization test TP-036-5 demonstrated that limestone is equal to dolomite as a desulfurizing sorbent; 208 hours of operation were successfully completed to expand the PDU data base using limestone as a sorbent. Work continued to resolve problems associated with the available procedures to quantify the reactivity of spent sorbent from PDU in-bed desulfurization testing. A PDU conceptual design was completed for an external sulfation system that will process spent in-bed sorbent. Additional fines recycle studies were conducted on thermal loss and thermal efficiency optimization, and PDU modifications were defined for improved fines recycle performances. These studies considered results of the most recent analyses and observations during in-bed desulfurization test TP-036-5 and external-bed desulfurization test TP-037-1. 6 refs.

35563 **(DOE/MC/21063—2578) A 32-Month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized bed gasification system: Quarterly report, July 1-September 30, 1986.** Haldipur, G.B.; Katta, S.; Kettering, E.; Lewandowski, D.A.; Lucas, J.L.; Schmidt, D.K.; Smith, K.J.; Weldon, J. (USDOE Morgantown Energy Technology Center, WV; KRW Energy Systems, Inc., Madison, PA (USA)). Jan 1988. Contract AC21-84MC21063. 149p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88001083/JAW.

Work at KRW this reporting period focused primarily on design of an external hot gas zinc ferrite desulfurization process (Task 1) and PDU testing of an in-bed desulfurization and alkali removal system (Task 2) to develop PDU-scale data. Under Task 1, work continued toward finalizing subsystem design specifications and releasing procurement packages for system components so that PDU modifications can begin no later than December 1985. In-bed desulfurization testing at the PDU thus far has provided the following operational and process performance insights: in-bed desulfurization with dolomite is operationally feasible without great effect on gasifier performance and carbon utilization; dolomite feed and withdrawal rates can be independently controlled to assure dolomite balance; sulfur removal greater than 90% can be achieved with a high-sulfur (4.6%) coal versus 86% with a lower sulfur (2.4%) coal; maximum carbon conversion efficiency of 93% was achieved during TP-036-3 (S.P. 7B). Carbon conversion efficiency was affected by performance of the fines recycle system. Analyses of data collected to date show that the primary parameters influencing desulfurization efficiency are: high bed dolomite concentration, low moisture content of the product gas, the mass input of sulfur, and gas residence time. 67 figs., 23 tabs.

35564 **(DOE/MC/22059—2570-Vol.2) Revised users manual, Pulverized Coal Gasification or Combustion: 2-dimensional (87-PCGC-2): Final report, Volume 2.** Smith, P.J.; Smoot, L.D.; Brewster, B.S. (Brigham Young Univ., Provo, UT (USA). Combustion Lab.). Dec 1987. Contract AC21-85MC22059. 323p. NTIS, PC A14;3. Order Number DE88001071/JAW.

A two-dimensional, steady-state model for describing a variety of reactive and non-reactive flows, including pulverized coal combustion and gasification, is presented. Recent code revisions and additions are described. The model, referred to as 87-PCGC-2, is applicable to cylindrical axi-symmetric systems. Turbulence is accounted for in both the fluid mechanics equations and the combustion scheme. Radiation from gases, walls, and particles is taken into account using either a flux method or discrete ordinates method. The particle phase is modeled in a Lagrangian framework, such that mean paths of particle groups are followed. Several multi-step coal devolatilization schemes are included along with a heterogeneous reaction scheme that allows for both diffusion and chemical reaction. Major gas-phase reactions are modeled assuming local instantaneous equilibrium, and thus the reaction rates are limited by the turbulent rate mixing. A NO/sub x/ finite rate chemistry submodel is included which integrates chemical kinetics and the statistics of the turbulence. The gas phase is described by elliptic partial differential equations that are solved by an iterative line-by-line technique. Under-relaxation is used to achieve numerical stability. The generalized nature of the model allows for calculation of isothermal fluid mechanicsgaseous combustion, droplet combustion, particulate combustion and various mixtures of the above, including combustion of coal-water and coal-oil slurries. Both combustion and gasification environments are permissible. User information and theory are presented, along with sample problems. 106 refs.

35565 **(DOE/MC/23075—2405) Measurement and modeling of advanced coal conversion: Quarterly report for the period April 1-June 30, 1987.** Solomon, P.R.; Hamblen, D.G.; Serio, M.A.; Smoot, L.D.; Brewster, S. (Advanced Fuel Research, Inc., East Hartford, CT (USA); Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). Jun 1987. Contract AC21-86MC23075. 141p. NTIS, PC A07;3. Order Number DE87006521/JAW.

During the third quarter work continued on characterization and pyrolysis of the Argonne coal samples. Additional work was done on mass transfer effects. To model pyrolysis data for low heating rate experiments, the internal mass transfer resistance to tar escape must be included. Preliminary design of the high-pressure reactor was completed. Studies of ignition were continued in the transparent wall reactor (TWR). The literature search was continued to identify the important effects of coal minerals in determining coal behavior. Experiments have also begun on the examination of the mineral composition and transformation of eight Argonne premium heat and mass transport effects in coal pyrolysis continued. In addition, calculations were done to define regimes of internal and external heat and mass transport control for conditions of interest. The mechanisms and rates of thermal NO formation in fuel-lean and fuel-rich conditions were determined from the literature. Two flow reactor configurations were designed and fabrication initiated for the NO/sub x/SO/sub x/ studies. The effect of neglecting turbulent fluctuation in gasification, was investigated. Code sensitivity to several thermal parameters affecting devolatilization was also investigated. A literature review was conducted of existing fixed-bed models for coal gasification. Available codes were identified for installation at BYU, and steps were taken to obtain those codes. A general outline of desired features to be included in the advanced model was developed. 60 refs.

35566 **(DOE/MC/23288—2580) Steam conditioning of coal for anyfuels productions: Third quarterly report, July 1-September 30, 1987.** Graff, R.A.; Zhou, P.; Brandes, S.D. (City Coll., New York (USA)). 1987. Contract AC21-87MC23288. 43p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010301/JAW.

Conditioning of coal in steam is being explored for the purpose of improving the yield and quality of condensable product obtainable in the mild gasification of coal. Yields of volatiles released during both steam and helium conditioning were determined for Illinois No. 6 coal and Mississippi lignite using weight loss measurements. Previously reported extraction yields for Illinois No. 6 coal were recalculated using the new data. A suprising new conditioning regime of considerable potential importance has been (tentatively) discovered for Illinois No. 6 coal at atmospheric pressure and temperatures between 518 and 644{degree}F (270 and 340{degree}C). Mild gasification of Illinois No. 6 coal was studied at 750 psia in the semicontinuous reactor system. The high liquid yields previously obtained after steam conditioning with this reactor operated in the injection mode are not now being realized with this reactor operating in the semicontinuous mode. The recovery and analytical methods were reexamined and the total recovery improved, from 90 wt % or less, to 92 to 96 wt %. A series of runs made using the same amount of coal as that fed in the injection mode did not give the improved yields. The possibility that helium flowing through the feed tube prevents access of steam to the reacting coal will be examined. Substantial progress has been made on the construction of the fluidized bed mild gasification test facility.

35567 **(DOE/METC—88/4076) A systems identification study: Methodology, algorithms, and application: Technical note.** Lawson, L.O.; Reel, J.A.; Keech, T.W. Jr. (USDOE Morgantown Energy Technology Center, WV). Nov 1987. 72p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88001033/JAW.

This report has presented work done in two major areas of system identification, time domain, and frequency domain analysis. In time domain analysis, the parametric method of representing a system, was chosen because it lends itself more effectively to practical applications. Modeling methodologies for single-input/single-output and for multivariable systems were developed. An algorithm was developed for general applications using the recursive least-squares estimation technique of parameter estimation. The algorithm is very flexible in that the vector and matrix sizes are automatically adjusted within the program to account for the system delay in data used in the estimation. In each test where the actual output was compared to the estimated out-put, the results appeared to be quite favorable. The tests with known process time delay also yielded good model performance. The time domain method of system modeling has good noise rejection capability. The time domain method can be performed from data evident of normal process perturbations, whereas the frequency domain method requires that specific driving inputs be applied to the process. The recursive nature of the developed algorithm has the potential for real-time implementaion. Adaptive control and process monitoring are candidate application. 17 refs., 25 figs.

35568 **(DOE/PC/79912—T1) Thiophene metabolism by E. coli: Technical progress report, September 15, 1987-March 15, 1988.** Clark, D.P. (Southern Illinois Univ., Carbondale (USA). Dept. of Microbiology). 1988. Contract FG22-87PC79912. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011159/JAW.

This report describes initial efforts at elucidating the mechanism of thiophene degradation by {und E. coli} by characterization of the genes involved. The objectives are to elucidate the biochemical pathway, to identify the genes involved and to determine how thiopene degradation is regulated. 3 tabs.

35569 **(DOE/PC/80516—11) Control of catalyst deactivation with ammonia: Quarterly report for period March 1, 1988 to May 31, 1988.** Satterfield, C.N. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Chemical Engineering). 1988. Contract FG22-85PC80516. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011567/JAW.

Some of our principal conclusions are: (1) If ammonia is added during reaction, it may cause some inhibition; but when the ammonia is removed, the catalyst activity is increased above the initial base-line. This enhancement can last for many hours or indeed days. (2) In studies in which ammonia treatment was made in absence of reaction, the treatment was effective to varying degrees with respect to all the reactions studied. When deactivation during reaction (e.g., a hydrogenation reaction) was caused by strongly adsorbed organonitrogen compounds, such as 1,2,3,4 tetrahydroquinoline, activity remained depressed for many hours after the nitrogen compound was removed (e.g., for the length of the experiment). However, addition of ammonia completely restores activity, attributed to displacement of the organonitrogen species. HDS of dibenzothiophene behaves differently than other reactions studied in its response to N-compounds. Ammonia added during reaction had no inhibiting effect, contrary to that observed with other reactions. (3) In changing the way in which ammonia treatment is carried out we have found some effects of changing such variables as pressure, temperature, duration of exposure to NH_3 (beyond a minimum), etc. The greatest effect occurred when an organosulfur compound was fed in the presence of a H_2NH_3 mixture and in the presence of a trickling liquid. In a representative experiment this approximately doubled the rate constant for the HDO of dibenzofuran over that observed before treatment. 5 refs.

35570 **(DOE/PC/90016—T2) Feasibility of producing jet fuel from GPGP [Great Plains Gasification Plant] by-products: [Quarterly report] for the period August 17, 1987-November 16, 1987.** Willson, W.G.; Knudson, C.L.; Rindt, J.R. (North Dakota Univ., Grand Forks (USA). School of Engineering and Mines). 1987. Contract AC22-87PC90016. 48p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010233/JAW.

The primary objective of this project is to assess the technical and economic feasibility of producing aviation turbine fuel from by-product streams of the Great Plains Gasification Plant located in Beulah, ND. A secondary goal of the project is to assess the conversion of the by-product streams into a new, higher-density aviation fuel. GPGP currently produces 150 MM SCFD of synthetic natural gas from 16,000 tpd of North Dakota lignite. In addition the plant generates three liquid hydrocarbon streams : 730 barrels per day (BPD) naphtha, 880 BPD phenols, and 3200 BPD tar/oil. Work at the University of North Dakota Energy and Mineral Research Center has focused on two tasks performed in support of these objectives. The first task consisted of a detailed analysis of the by-product streams under consideration. Of the three streams, the tar oil stream is the largest and shows the most promise for ugrading to aviation turbine fuel. Detailed characterization data on the tar/oil were presented in the previous quarterly. A true boiling point (TBP) distillation was performed on the GPGP phenol stream, yielding nine fractions which were characterized using NMR, GC, and GC/MS. The second task involves an engineering

evaluation of by-product upgrading. Two methods are under investigation for the production of aviation fuel: single-stage, in which heteroatom removal and hydrogenation are accomplished in a single step, and two-stage, in which the heteroatoms are removed in the first-stage, and hydrogenation occurs during the second stage. Hydrogenation was improved by increased pressure and temperature, although the measured effect on aromatic content awaits further analyses. Data indicates that, to achieve complete nitrogen and sulfur removal, the preferred operating conditions are temperatures of 610-645{degrees}F and pressures of at least 2000 psig. 3 refs., 26 figs., 9 tabs.

35571 **(DOE/PC/90528—T4) Thermodynamics of coal liquid/solid systems: Quarterly progress report for the period of December 16, 1987 to March 15, 1988.** Holder, G.D. (Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering). Jun 1988. Contract FG22-86PC90528. 10p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011602/JAW.

The effluent streams of coal liquefaction processes often contain both liquids and solids (THF or pyridine insolubles). The solids appear to affect the physical properties of these liquids due to the adsorption of the heavy liquid components on the coal surface. The design of liquefaction reactors and separation units is dependent to a great extent on the thermodynamics of these multicomponents, multiphase mixtures. The effort to develop data bases for coal liquefaction products has three basic components: (1) pure components physical properties, such as boiling point, critical temperature and pressure, acentric factor, molecular weight and specific gravity and polarity, (2) binary vapor pressure data which enables phase behavior to be calculated for binary and, assuming the interaction of unlike molecules are independent of the pressure of a third species, multicomponent systems, (3) vapor pressures of solid-liquid systems as a function of the solids content. This allows the effect that solids have on the distribution of liquids between phases to be calculated. 21 refs., 4 tabs.

35572 **(DOE/PC/90529—6) Micropore diffusion in coal chars under reactive conditions: Quarterly technical progress report, 15 December 1987--15 March 1988.** Calo, J.M.; Perkins, M.T.; Lilly, W.D. (Brown Univ., Providence, RI (USA). Div. of Engineering). 1988. Contract FG22-86PC90529. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011422/JAW.

The current project is concerned with the development and application of a new technique to measure micropore diffusion under actual gasification conditions. The method is an outgrowth of and related to the transient kinetics approach to the measurement of kinetic rate parameters for char-gas reactions that has been developed in our laboratory. It can be shown that the initial transient behavior of a species introduced as a step-function into a "gradientless" reactor in which char is present, is controlled by the transport resistance offered by the char micropores. Therefore, this data can be analyzed for micropore diffusion time constants. In addition, due to the time-resolved nature of the process in the reactor, the initial diffusion step is separated (in time) from any subsequent gas-solid reaction steps. Therefore, diffusion measurements can be performed under gasification conditions. Though it is still premature to draw very many firm conclusions from our data thus far, there are, nevertheless, some important aspects that should be noted. Of primary importance is the conclusion that the experimental apparatus is sufficiently sensitive to measure variations in reactor space times of the requisite magnitude. Data reported both here and in the previous report have established the ability to measure diffusion time constants of relevant orders of magnitude. In addition, the data indicate activation energies on the order of 1--2 kcal/mol, which are characteristic of micropore diffusion processes reported elsewhere, and, therefore, reinforce our confidence in the technique. 13 refs., 5 figs.

35573 **(EUR—11128-EN-FR) Synthesis gas production in the blast furnace: Feasibility study. Demonstration project. Final report.** (Commission of the European Communities, Luxembourg. Directorate General Telecommunications, Information Industries and Innovation; Universite Libre de Bruxelles (Belgium). Centre de Recherches Industrielles). 1987. 160p. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Energy.

This is the final report of a feasibility study carried out in the framework of the European Commission Energy Demonstration Programme. The aim of the study was twofold: to determine whether the conversion of blast-furnace into a gas generator is technically feasible, and to evaluate the approximate cost price of the synthesis gas produced. It has been shown that the existing technique of injecting coal at the level of the tuyeres is directly applicable to coal gasification in the blast-furnace. Several operating scenarios have been studied, particularly in the light of the need to maintain an efficient circulation of fluids in the blast-furnace. From the economic viewpoint, the principal advantage of the process is that the capital investment required to convert the blast-furnace into a coal gasifier is relatively small compared to the cost of a conventional gas generator. The former has been estimated at around 20 millions ECU for a production capacity of 80,000 Nm^3 per hour ($CO + H_2$). If the estimates are confirmed by large-scale testing, the cost price of the gas will be 60% of the cost price, per gigajoule, of gas from normal coal gasification, 67% of the price of gas from the reforming of natural gas and 64% of the price of gas from liquid hydrocarbons. A large part of the study deals with the analysis of the potential end uses of the huge quantities of syngas that would have to be used should this technology be applied.

35574 **(NP—8010872) Catalytic hydrogenation of high volatile bituminous coal and various coal extracts: Final report for 1986/1987 SOMED Project.** Kispert, L.D. (Alabama Univ., University (USA). School of Mines and Energy Development). Sep 1987. 21p. School of Mines and Energy Development, Box 6282, University (Tuscaloosa), AL 35486. Order Number TI88010872/JAW.

Model compounds, naphthalene, quinolines, and isoquinoline (possible extracts of coal) were selectively hydrogenated to 1,2,3,4-tetrahydro products by a Ziegler type catalyst [I] made of cobalt stearate and triethyl aluminum (1:2 molar ratio) in hexane solvent and temperatures as low as 22{degree}C and hydrogen pressure of 700-800 psi. It was established that a hydrogen pressure greater than 300 psi is crucial for hydrogenation to occur. For instance, at a pressure of 300 psi, only 5% reduction of naphthalene was observed with the rest of the starting material remaining intact. The important feature of this Ziegler catalyst is that it works best at low temperatures, moderate pressures and short reaction times, most unusual for a Ziegler catalyst. The catalyst, however, failed to bring about any reduction with such compounds as 8-nitro-2-methylquinoling, 4-chloro-2-methylquinoline, phenol, and dibenzothiophene. These failures are not surprising as nitro compounds are known to interact with and deactivate similar catalysts and homogeneous transition metal catalysts usually fail in the present of sulfur containing compounds. 23 refs., 2 tabs.

35575 **(PB—88-197363/XAB) Fundamental investigations of underground coal gasification. Final report, March 1982-December 1986.** Gunn, R.D. (Wyoming Univ., Laramie (USA). Dept. of Chemical Engineering). Aug 1987. 72p. NTIS, PC A04/MF A01.

See also PB—83-243964.

The report presents several mathematical models of underground coal-gasification processes. Through these models, a much better theoretical understanding of underground coal gasification becomes possible. Specific phenomena studied were the effects of high-amplitude pressure oscillation, reverse combustion, spontaneous ignition at high pressures, an analytical model of reverse-combustion channeling, an exploratory study of electrolinking, cavity-growth behavior, and a technical evaluation of the Forestburg underground coal-gasification field test at Forestburg, Alberta. This test is especially interesting because the site was escavated after completion of the experiment.

35576 **(SAND—88-0976C) Pore structure evolution during gas-solid reactions occurring at high temperatures.** Zygourakis, K.; Glass, M.W. (Sandia National Labs., Albuquerque, NM (USA); Rice Univ., Houston, TX (USA). Dept. of Chemical Engineering). 1987. Contract AC04-76DP00789. 46p. (CONF-871113—8). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011547/JAW.

From American Institute of Chemical Engineers annual meeting; New York, NY, USA (15 Nov 1987).

Coal particles were devolatilized in a captive-sample reactor at heating rates ranging from 0.1 to 1000{degree}C/s. Macropore structure measurements obtained via video microscopy and digital image processing techniques quantified the strong effects of pyrolysis heating rates, particle size and coal rank on the pore structure of the produced chars. Digitized photomicrographs of actual particle cross-sections obtained directly from the image processor were then used to simulate the gasification of these chars under strong diffusional limitations using an erosion algorithm. The discrete computational approach accounted for the irregular macropore structure of chars, the opening of initially closed porosity due to burn-through and the fragmentation of the original particles. Thus, quantitative on the temporal evolution of pore surface area and particle fragmentation was obtained by applying image analysis techniques. Simulation results show that the macropore structure, and hence the pyrolysis conditions, strongly affect the rate vs. conversion patterns in the regime of strong intraparticle diffusional limitations. Reactions rates for single particles increase initially in a "step-wise" fashion and distinct jumps occur when the reaction front reaches large internal cavities previously inaccessible to the reactant gases. Pronounced maxima in the rate vs. conversion curves are thus observed. Image sequences show that particles fragment into several smaller pieces as the gasification proceeds. Recent literature data on the gasification of single coal particles in a fluidized bed support our model predictions, pointing out both the inadequacy of shrinking core models and the importance of particle fragmentation. 25 refs., 23 figs.

35577 **(VTT-TUTK—492) Techno-economic assessment of high-pressure peat liquefaction.** McKeough, P.; Tulenheimo, V. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Aug 1987. 62p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752873/JAW.

The study is part of a research program, the aim of which is to identify the most promising process concept for the conversion of peat into transport fuels by high-pressure liquefaction. The study consists of techno-economic assessments of a base-case concept and of four sensitivity-case concepts. The products are heavy primary oils which require further upgrading into transport fuels. The designs of the processes were based on data generated in bench-scale experiments. The feedstock capacity of the base-case concept was 1990 t/d of milled peat (50wt% moisture) and the main results of the economic evaluation of this concept were (costs as of mid-1985): total capital requirement 86 x 10''6 USD (8% interest rate), production costs of primary product 6.4 USD/GJ (for peat price of 1.7 USD/GJ), overall thermal efficiency 62% (HHV basis). On the basis of the results of the sensitivity studies it was concluded that thermal drying of milled peat, prior to liquefaction, is advantageous; that the concentration of peat in the feed slurry should be limited to about 30 wt% solids; that operating pressures lower than 20 MPa should be sought; and that the economics of the process are not sensitive to the chosen method separating solids from the product stream. A preliminary estimate of the costs of upgrading the primary product into gasoline was also made. Gasoline production costs in the range 10-12 USD/GJ were obtained for the base case. This is a promising result, particularly when the Finnish refinery price (exclusive of taxes) is used as a reference.

35578 **(VTT-TUTK—507) Flash-pyrolysis of peat, wood, bark and lignin. Pyrolysis tests with Finnish peat at the University of Waterloo.** Piskorz, J.; Scott, D.S.; Vesterberg, I.B.; Arpiainen, V. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Oct 1987. 40p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753003/JAW.

Flash pyrolysis is the rapid thermal decomposition of an organic material in an oxygen-free atmosphere. Research on flash pyrolysis is a rather new field, whilst research on conventional pyrolysis, employing slow heating, has long traditions. By using flash pyrolysis, it is possible to convert a large part of the feed material into organic liquids. This liquid material can be used directly as a fuel oil. After further treatment it could possibly be used as a source of motor fuels or chemicals. The publication deals with flash pyrolysis tests carried out with Finnish Peat in fluidized bed reactors. The experimental work was performed at the University of Waterloo, Canada. A bench-scale unit (10-100 g/h) was the main tool in this test programme. In one experiment a larger (pilot) unit (1-3 kg/h) was employed. Earlier pyrolysis tests with wood, bagasse, peat, straw and coal provided interesting reference data. The main objective of the work was to investigate the effects of temperature (range 450-750 deg C), reactive atmosphere (nitrogen, methane) and gas-phase residence time (0.30-1.00 s) on the organic liquid yields. The pilot run was done at near optimal conditions to produce a larger quantity of organic liquid. The highest yield of recovered organic liquids about 50 wt-% of moisture and ash-free raw material, was found at about 450-475 deg C using the shortest residence time, 0.30 s. At temperatures over 500 deg C, the organic liquid yield decreased quickly in favour of gaseous components such as carbon monoxide and hydrocarbons. The maximum yield of light olefins was found to be about 10 wt-% at the highest temperature employed (750 deg C). Methane was an inert reaction gas in the conditions of these tests. The total recovery of pyrolysis products was excellent, typically 98-100%. The pyrolysis tests were carried out under virtually steady-state reaction conditions. Agreement between the bench-scale results and the pilot test results was very good.

35579 **Process and apparatus for coal hydrogenation.** Ruether, J.A. (to Dept. of Energy, Washington, DC). US Patent 4,735,706. 5 Apr 1988. Filed date 27 May 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A method for the hydrogenation of coal in a reactor operating at a pressure substantially greater than atmospheric pressure at elevated temperatures in the presence of a catalyst for converting the coal to hydrocarbon liquids and gasses, is described comprising the steps of preparing an aqueous slurry of coal particulates, a water soluble catalyst and water with the water being in a sufficient amount to effect the dissolution of the catalyst and to provide the slurry with the sufficiently low viscosity to be mechanically pumped, adding an adequate amount of oil to the slurry to form agglomerates of the coal particulates, agitating the slurry to form the agglomerates, mechanically pumping the resulting slurry containing the agglomerates, excess water and unagglomerated solids to a pressure of at least about 1000 psig, separating the agglomerates from excess water and unagglomerated solids, passing the separated agglomerates through a dryer-preheater, contacting the agglomerates in the dryer-preheater with a stream of hot gas flowing countercurrently to the direction of flow of the agglomerates for drying the agglomerates, depositing the catalyst on the agglomerates and preheating the agglomerates prior to introduction thereof into a hydrogenation reactor. Thereafter contact the coat particulates in the reactor with liquid reaction products and hot hydrogen to effect the hydrogenation of coal particulates at a pressure of at least about 1000 psig and a temperature in a range of about 340° to 450°C.

35580 **Synthesis, structure, and reactivity of $[Fe(dbt)(CO)_2(Cp)][BF_4]$ and related S-bonded thiophene complexes.** Goodrich, J.D.; Nickias, P.N.; Selegue, J.P. (Univ. of Kentucky, Lexington (USA)). *Inorganic Chemistry;* 26: No. 21, 3424-3426(21 Oct 1987).

Organometallic compounds including iron and molybdenum carbonyls are known to catalyze the hydrodesulfurization and hydroliquefaction of coal. Thiophenes, especially dibenzothiophene, (dbt), are the best models for organically bound sulfur in coal, but there are few good models for the attachment of thiophenes to metallic catalysts via sulfur, a bonding mode currently believed to be the first step in structure of an iron-dibenzothiophene complex in which the thiophene is not part of a chelating ligand system are described herein. Both spectroscopic and single-crystal x-ray diffraction studies of the Fe-thiophene complex indicated that the thiophene ligands in different thiophenes are bonded to the iron via sulfur only. 29 references, 1 figure.

35581 **Application of model compounds to the study of microbial degradation of coal.** Campbell, J.A.; Frederickson, J.K.; Stewart, D.L.; Pyne, J.W.; Wilson, B.W.; Bean, R.M. (Pacific Northwest Labs., Richland, WA (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

Cohen and Gabriele first reported the ability of certain microbes to degrade low-rank coals. They showed that a white-rot fungus, P. versicolor, could metabolize oxidized lignite, producing a high molecular weight, highly polar and water soluble material. To better understand the mechanisms of key reactions involved in the degradation process, model compounds having coal-related functional groups were utilized. P. versicolor and P. chrysosporium were cultured in Kirk's minimal medium (10ml) for 10 days in 125 ml Erlenmeyer flasks. Benzyl benzoate and methoxybenzophenone, model compounds, were added to the cultures to obtain 10 and 100 μg/ml. After incubation for several days, the cultures were filtered and extracted with chloroform. The extracts were concentrated and analyzed by GC/FID and GC/MS to determine the amount of degradation and identify the degradation products. These model compounds will also be investigated utilizing cell-free enzymes.

35582 **(DOE/PC/70795—T9) The macromolecular chemistry of coalification: Quarterly report for the period November 1, 1987-January 31, 1988.** Kovac, J.; Moore, C.E. (Tennessee Univ., Knoxville (USA). Dept. of Chemistry). 21 Mar 1988. Contract FG22-84PC70795. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88007330/JAW.

A systematic non-linear least squares analysis of coal swelling data has been initiated. Four different theoretical models will be used. The theoretical parameters tested include the incorporation of non-Gaussian chain statistics and the incorporation of the logarithmic volume term in the swelling equation. The data analyzed are the data obtained by Larsen, Green and Kovac. The first analyses are reported here. 3 refs., 2 tabs.

35583 **(DOE/PC/80517—T10) Improving the stability of coal slurries: Quarterly progress report for the period December 15, 1987-March 15, 1988.** Fogler, H.S. (Michigan Univ., Ann Arbor (USA). Dept. of Chemical Engineering). 1988. Contract FG22-85PC80517. 16p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008102/JAW.

Last reports showed that the conformational change (steric effect) of acidic polysaccharides on the surface with the solution pH is responsible for change of stability and peptization. This conformational change is influenced by the nature of electrostatic interactions between the surface and the polysaccharides. To explore this influence, both positively charged amidine latices and negatively charged sulfate latices were used with poly (galacturonic acid), PGUA, as a stabilizer. Results showed that the stability of amidine latices is greater at lower pH, which had also been found for sulfate latices. Photon correlation spectroscopy study showed that PGUA gives a comparable steric layer thickness with sulfate latices to that with amidine latices at the same pH due to the electrostatic repulsion between the negatively charged surface and the negatively charged PGUA. The conformational change causing peptization was found to be strongly influenced by the electrostatic interaction between particles and the adsorbed polymer. In case of amidine latices, lowering the pH did not immediately bring about the peptization because of the strong adsorption while the sulfate latices could be peptized. In order to study the peptization mechanism of sulfate latices, the decrease in turbidity during peptization of doublets was analyzed using the optical cross sections obtained from Mie theory. Results showed that the peptization rate is proportional to the particle concentration of doublets and that the peptization rate constant does not change with time. 9 refs., 6 figs., 1 tab.

35584 **(DOE/PC/80529—T8) Effects of coal structure on pulverized coal combustion processes: Quarterly technical progress report No. 10 for the period 1 January 1988-31 March 1988.** Wells, W.F.; Smoot, D.L. (Brigham Young Univ., Provo, UT (USA). Combustion Lab.). 15 Apr 1988. Contract FG22-85PC80529. 33p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009171/JAW.

The general objective of this study is to define and quantify the relationships between coal composition and structure and associated combustion and conversion behavior for three very different domestic coals of interest. To accomplish this objective, two tasks have been identified. The first is to characterize the virgin coal and the process chars. This will give the necessary information to determine if the char preparation process yields or rates are dependent on coal chemical or physical characteristics. In the past, insufficient information about the char physical and chemical structure has been a hindrance to the determination of their influence on reaction rate. The characterization tests outlined will give a detailed knowledge of the coals and chars. The second task is to measure the high temperature reaction rates of the virgin coals and their derived chars, and to interpret results in light of Task 1. 17 refs., 14 figs., 4 tabs.

35585 **(EPRI-CS—5644-Vol.1) Laboratory guidelines and procedures for coal analysis: Volume 1, Assessing the cleanability of fine coal.** Bosold, R.C.; Glessner, D.M. (Electric Power Research Inst., Palo Alto, CA (USA)). May 1988. 128p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011528/JAW.

The conventional laboratory static bath float/sink method of measuring the theoretical limits of coal cleaning is unreliable for ultra-fine (minus 100M topsize) coal particles because of their long and erratic settling rates. Developing a reliable method to assess the theoretical cleanability of ultra-fine coal has been given impetus by the increased emphasis on reducing sulfur dioxide emissions from power plants, greater quantities of fines created by mechanized mining methods, and the development of advanced physical coal cleaning processes that grind coal to ultra-fine sizes in an effort to achieve high coal impurities liberation. EPRI, therefore, commissioned researchers at the Homer City Coal Laboratory in western Pennsylvania to develop and demonstrate a float/sink procedure for ultra-fine sizes. Based on test work performed on two ultra-fine size fractions (100M x 200M and 200M x 0), a detailed laboratory procedure using a centrifugal device was established. Results obtained using the guideline presented in this report are as accurate as those obtained using the static bath float/sink method, and for 200M x 0 material, more accurate. In addition, the centrifugal procedure is faster and less costly than the conventional static bath float/sink method. 12 refs., 32 figs., 1 tab.

35586 **(NZERDC-P—108) Image analysis of New Zealand coke.** Clemens, A.H. (New Zealand Energy Research and Development Committee, Auckland). Aug 1986. 27p. Coal Research Association of New Zealand, Wellington.

Buller coal-derived coke samples were being considered as a source of anode carbon. A semi-automated VIDS II Image Analysis System attached to a microscope using reflected light was used to study the coke porosity. It was found that a coke with a high open porosity contribution from large open pores, and of sufficient strength, would be the most likely to generate an anode of acceptable baked density. However other factors, possibly related to the extent of ordered coke structure, are also important. 10 refs.

35587 **(PB—88-197405/XAB) Electron-transfer reactions in coal-model compounds. Annual report, January-December 1987.** Penn, J.H. (West Virginia Univ., Morgantown (USA). Dept. of Chemistry). Mar 1988. 52p. NTIS, PC A04/MF A01.

Oxidation of benzpinacol (BPC) was effected with two Fe(III) (1,10-phenanthroline)3 complexes. The product of these reactions is exclusively benzophenone when 2,6-di-t-butylpyridine is

added to the solution. The rates of the electron-transfer process were determined by monitoring the change of the Fe(III) and Fe(II) concentrations by uv-vis spectroscopy. By measuring the rates of the electron transfer as a function of temperature, activation parameters for the electron-transfer process from BPC to Fe(III) (1,10-phenanthroline)3 and to Fe(III) (4,7-diphenyl-1,10-phenanthroline)3 were determined. These data indicate the importance of entropy in potential electron-transfer reactions. Novel bond-cleavage reactions have been observed through the use of added oxygen indicating a new mechanistic pathway for coal-polymer fragmentation.

35588 **(SAND—87-1165C) The design of methane activation catalysts.** Stohl, F.V.; Shelnutt, J.A.; Granoff, B. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 11p. (CONF-880602—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88002265/JAW.

From 9. international catalysis congress; Calgary, Canada (26 Jun 1988).

The goal of Sandia's methane activation program is to use computer-aided-design (CAD) techniques to guide the synthesis of catalysts for the direct conversion of methane. Several enzymes, such as cytochrome P_{450} and methane monooxygenase, catalyze the oxidation of alkanes to alcohols at low temperatures and pressures. we are attempting to design catalysts that mimic these enzymes. Our CAD studies on porphyrins, which are the active sites in many enzymes, are being combined with 1) structural characterization of naturally occuring catalysts; 2) the development of activity and selectivity tests; and 3) the synthesis and characterization of designed catalysts. Results of CAD studies on enzymes that carry out alkane activation or perform C_1 chemistry and on unique synthetic porphyrins have shown that the synthetic porphyrins can have site configurations analogous to these enzymes. The CAD work also uses molecular-energy minimization and dynamics calculations to evaluate methane interactions with the synthetic porphyrins. Activity tests have been set up for cyclohexane, hexane and butane with additional tests being developed for methane and ethane. Synthesis of designed porphyrins is currently underway. 9 refs., 4 figs.

35589 **(STEV-TORV—87-11) Contents of duff in sod peat. Final report.** Stridsberg, S. (Statens Energiverk, Stockholm (Sweden)). Jun 1987. 64p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752963/JAW.

The relatively high dryness of the sod peat makes it a very competitive fuel. However, the final quality is very much dependent of the virgin peat and specific production conditions. Difficulties will occur particularly in connection with the sometimes high content of fines. These will, besides fire hazard in storage, also cause freezing and bridging problems and complications in combustion by blocking the grates. During the project work analyses have been carried out at 5 different boiler plants, both samples collected at random from peat deliveries and samples from selected points in the plant to find out how much the transport equipment will chrush the sod peat. The analyses normally show reasonable contents of duff, 5-10% < 5mm particle size. This is the particle size limit where we know from experience that the operational troubles occur. Of course this limit also is related to the equipment and as an example a thin grate will be sensible for particles already at 15 mm size. If the content of fines is too high it will be more and more common to screen the sod peat at the bog. The investigation has also handled the dependance of moisture and ash content of the fractional distribution. The moisture content is higher in peat duff than in the whole pieces. This corresponds to the peat from the bog and the moisture content of the duff might be 10% higher than that of the pieces. We have to distinguish between delivered peat duff and small particle fraction generated in the plant. The worst treatment of the peat will appear in screw conveyors, screw feeding equipment and several bar feeders, as the influence is negligible in scraper, band and elevator conveyors. Thus the choice of transport equipment could strongly effect on the economy.

35590 **(STEV-TORV—87-15) Determination of bulk density in sod peat and milled peat.** Sandstroem, T.; Burvall, J.; Wigge, B. (Statens Energiverk, Stockholm (Sweden)). Feb 1987. 28p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752964/JAW.

Stiftelsen Svensk Torvforskning Project Report 13.

Different kinds of vessels have been tested to compare repeatability of measuring within one vessel type and reproducibility between different vessel types. The types of vessel have been compared with measurement of bulk density in large container (truck container). For bulk density in larger container, difference in results depends on following criteria: - Measurement in connection with loaded or unloaded container. - The number of sampling points on the surface in the container. - If the surface in the cargo has been even out or not before measuring. The investigation shows that, comparable results between measuring in a vessel and measuring in a large container is obtained in the material if the vessel is packed until constant weight approves. The reproducibility in results, comparing bulk density in a large container against measuring bulk density in a vessel (packed until constant weight approves) is good provided that: - The material in the container must be even out before measuring. - At least 5 points must be measured in the container. - Measuring must bee done at the occasion of unloading the container. - The density must be reported as basic density. (authors).

35591 **(STEV-TORV—87-18) Sampling for the analysis of fractional distribution of peat and biomass fuels.** Sandstroem, T. (Statens Energiverk, Stockholm (Sweden)). Sep 1987. 60p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752967/JAW.

The variation for each method has been evaluated as well as differences between them. Size distribution has also been measured within a load for three types of wood fuel and sod peat. Finally a number of sod peat and wood fuel assortments have been characterized with respect to particle size and each fraction analyzed for ash content and dry matter. The following results have been obtained: -Particle size distribution shows a considerable variation both within and between different fuel types. The fraction smaller than 3mm varied between 7.0-21.7% with respect to dry matter while sod peat varied from 1.8 to 8.0%. -For chips of branches and whole-tree chips dry matter decreased with decreasing particle size. -Ash content in fraction <3mm was considerably higher for branch chips and whole-tree chips compared with other fractions.For sod peat with mineral contamination ash content increased with decreasing particle size. -The variation in particle size distribution within a load was large. The difference between the biggest and smallest value was in some cases larger than the mean of the fraction. -All fuel types are equally inhomogenious. -No significant differences was found between the different sampling methods. -Sod peat sampling during tipping showed a clear dependence on the position of the sampler in the stream. Close to the vehicle the amount of smaller particles was higher than farther away from the vehicle. Sampling for particle size analysis should preferrably be done on falling material. In practise this means when unloading the truck or between two conveyors.

35592 **(SVF—254) Testing of coal and sorbents from low NOsub(x) and SOsub(x) reduction at Stigsnaes Power Plant and trial results from Stigsnaes Power Plant.** Bengtsson, M. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Mar 1987. 43p. (In Swedish). NTIS (US Sales Only), PC A03. Order Number DE88752981/JAW.

Coal and sorbents from full scale trials for NOsub(x) reduction and SOsub(x) capture from Stigsnaes power plant have been tested. The coal has been tested by DTGA, and in a drop tube furnace. Devolatilization burn-out and N release have been studied. The devolatilization was considerably slower and less than for Polish coal when comparing DTGA, DTF and pyrolysis data. The Gondwana coal had a high inertinite content. The two sorbents, Danish limestone and calcium hydrate, reached a high degree of calcination already after 75 ms at 1050 degrees C. The maximum BET-area was also reached at that point indicating that a high sorption of SO/sb2/ ought to be possible at that temperature. The NOsub(x) emission for this coal was high, ca 1000 ppm,0% O/sb2/, dry. Special arrangement for NOsub(x) reduction resulted in up to 25% NOsub(x) reduction. Unusually high temperature zones, ca

1700 degrees C, were found 1.5 m from the burners. The devolatilization and N-evolution from coal and char was slow in the lab tests. SOsub(x) capture by Danish limestone Ca/S ca 2 at 100% load reduced SOsub(x) emission by 20-23%. At 70% load the reduction was ca 10% higher. To achieve a better SOsub(x) capture new injection ports will be located further upstream in the boiler where the temperature is lower. The NOsub(x)-emission was higher than normal. The performed tests by changing the air distribution in the existing burners at reduced load resulted in a 25% lowering of the emission, which was less than expected.

35593 **(SVF—273) Determination of the calorific value of solid fuels.** Oesterholm, L.H.; Andersson, L. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Aug 1987. 114p. (In Swedish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88753345/JAW.

The investigations made in this project show that there is no bias between standard methods and instrumental methods. Standard methods are, however, more accurate than instrumental methods. There may be larger differences in accuracy between different laboratories. This is due not only to the type of calorimeter, or the condition of used instrument, but also to insufficient knowledge in calorimetry. The determination of moisture in the analysis sample has been shown to be a surprisingly large source of error. The moisture determination may be highly biased depending on method used. The investigations also show that the correction for nitric acid is practically independent of the nitrogen content of the sample. Also, it is not necessary to add water to the bomb before combustion. The calorific value decreased with ageing of the fuel. This makes it difficult to develop certified reference materials for QA. Experiences gained from the project may be used in future standardization work. In Sweden a common standard could be developed for determination of gross calorific values of coal, peat, wood and bark. This project was run at the National Testing Institute (Sweden) where five standard methods and two instrumental methods for determination of calorific value of coal, peat, wood and bark have been investigated. A round robin test with 24 participating laboratories in Denmark, Finland and Sweden has been run to provide more statistical material. (authors).

35594 **(VTT-TIED—762) Properties of biomass and peat fuels. Handbook.** Alakangas, E.; Kanervirta, M-L.; Kallio, M. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Sep 1987. 130p. (In Finnish). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88752994/JAW.

The aim of this publication is to consider the properties of solid indigenous fuels like peat, wood and straw. We also want to introduce the properties of domestic fuels from various points, on the basis of several different sources and thus offer the readers the opportunity to compare. The hand-book is mainly collected of reports published at the Technical Research Centre of Finland (VTT). Additionally, the results from analyses carried out by VTT's Laboratory of Fuel Processing and Lubrication Technology and Domestic Fuel Laboratory have been utilized. At the beginning of the book there are definitions of the properties. The information from different sources has been standardized to correspond to the definitions. At the end of each chapter there is a referencelist. The chapters of the hand-book have been divided into two groups: firstly, general properties, modern production methods and methods of use of each fuel are described. Secondly, the production, handling and application technical properties are presented in tables and figures. Also the emissions of the fuels have been treated. At the end of the publication there are comparison tables of the most important.

35595 **Ruthenium tetraoxide catalyzed oxidation of maceral groups.** Choi, C.; Wang, S.H.; Stock, L.M. (Argonne National Lab., IL (USA)). *Energy and Fuels;* **2**: No. 1, 37-48(Jan-Feb 1988).

Pure liptinite, vitrinite, and inertinite group maceral fractions from a representative high-volatile A bituminous coal have been oxidized with ruthenium (VIII) to produce a broad series of aliphatic carboxylic and benzenecarboxylic acids. Chromatographic and mass spectroscopic procedures were used to identify these compounds, and isotope dilution techniques were used to establish the yields of certain key products. The product distributions from the individual macerals differ considerably. Generally speaking, the observations for the benzenecarboxylic acids indicate the dominance of 1,2-fused benzene rings and suggest that the aromatic structures in the three different maceral groups are similar. The broad array of aliphatic acids obtained from the three macerals imply that the aliphatic structural components of the vitrinite and inertinite maceral groups are similar with hydroaromatic compounds predominating whereas the liptinite group contains polymethylene chains that bridge aromatic structures. Thus, the differences between the inertinite and vitrinite arise from variations in the concentrations of similar types of aromatic and hydroaromatic structures whereas the liptinites contain other quite different aliphatic substances.

35596 **Association of major, minor and trace inorganic elements with lignites. III. Trace elements in four lignites and general discussion of all data from this study.** Given, P.H.; Miller, R.N. (Pennsylvania State Univ., University Park (USA)). *Geochimica et Cosmochimica Acta;* **51**: No. 7, 1843-1853(Jul 1987).

Fourteen trace elements (La, Cr, Sc, Y, Yb, Ga, Ni, V, Be, Zr, Ge, Pb, Sn, Ce) have been determined by emission spectroscopy in the ash from 7-17 levels within four early Tertiary lignite seams from Wyoming, Texas and Alabama, and two elements (Cu, Zn) in the acid-soluble and acid-insoluble fractions of the samples by inductively coupled plasma arc emission spectrometry. These elements were also determined in the roof and floor strata enclosing the seams. In a general discussion of the results of the whole series of three papers, a model describing the incorporation of inorganic components in peats is presented, based on the erosion of rocks by chelating organic acids and other agents, followed by transport in water and trapping of mineral grains and dissolved ions by the organic matter of peat. Inorganic materials in peat thus constitute the principal input of mineral matter into coals. The elements that tend to be enriched near the margins of lignite seams are mostly those that have complexed with organic matter. However, the data on this enrichment from the authors own and previously published work are quite variable, no doubt depending on the nature and efficiency of transport of the incoming cations.

35597 **A numerical study of coal particle heating and its influence on devolatilization.** Celik, I.; Godbole, D.B.; O'Brien, T.J. (Dept. of Mechanical and Aerospace Engineering, West Virginia Univ., Morgantown, WV (US)). pp 223-229 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

This paper reports a numerical study of the steady, turbulent, reacting two-phase (gas-coal) flow in an entrained-flow reactor using a state-of-the-art computer code. Emphasis is focused on the temperature history and heating rates of individual coal particles. The iterative solution procedure resolves the gas flow in an Eulerian and the particulate flow in a Lagrangian frame of reference, respectively. The turbulent gas motion is modeled using the standard κ-ϵ model. The devolatilization is modeled using two competing reactions. The interactions between the two phases are accounted for by including the particle mass, momentum, and energy sources in the gas flow equations for each computational cell. The mechanism by which the particle temperature history affects the devolatilization process is elucidated. The predicted volatile yields are in good agreement with measurements.

35598 **(CEGB-OED-STB(S)—87-0014-R) P.F. ash injection as a means of preventing potential acid smut emission during high oil burn.** Foreman, R.C.; Moss, W.K.A.; Pankhurst, K.S. (Central Electricity Generating Board, Gravesend (UK). Operational Engineering Div.). May 1987. 18p. Central Electricity Generating Board, Gravesend (United Kingdom). Operational Engineering Division, Scientific and Technical Branch.

While Tilbury 'B' Power Station was operating with an oil burn of 90% by heat release, tests were carried out to determine whether recycled pulverised fuel ash (PFA) mixed with the coal burned could be used as an alkaline additive to prevent the emission of acid smuts from the chimneys. PFA was added to the coal so as to adjust the total ash content to that expected for a coal burn of 20% by heat release. This report describes measurements made on Unit 7. The main findings are as follows: at an oil burn of 90% by heat release, SO_3 levels were higher than expected for coal firing alone; accumulation rates of solids on temperature-controlled samplers were higher than expected for oil firing alone; there was no likelihood of acid smut emission at the 90% oil burn while the extra PFA was being added. The report recommends that for sustained operation at an oil burn in excess of 80% by heat release, additional PFA should be added to the coal feed to give a total ash loading equivalent to a 20% coal burn. Steps should be taken to ensure that this ash is only recycled once, and consideration should be given to the environmental implications of its disposal. 13 refs., 2 figs., 7 tabs.

35599 **(CONF-8803102—2) The salt models of two advanced electron beam FGC processes.** Hu, N.; Chang, S.L.; Berry, G.F. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 12p. NTIS, PC A03/MF A01;3. Order Number DE88009963/JAW.

From International conference on advanced science and technology; Chicago, IL, USA (19 Mar 1988).

Conventional wet limestone flue gas desulfurization systems are primarily used for moderate (e.g., 50%) reductions in sulfur emissions at some coal-fired power plants. Advanced flue gas clean-up methods using the combination of electron beam and alkali injection techniques have been introduced to remove pollutants SO/sub x/ and NO/sub x/ from the glue gas more effectively (e.g., 90%) than conventional methods. To enhance their potential applications and provide a common base for the comparisons of their performances and costs, computer simulation models are needed. In this paper, two simulation models, the electron beam spray dryer and the electron beam ammonia injection processes, which are major electron beam variants under development in the US, are introduced. These simulation models use the System Analysis Language Translator code developed at Argonne National Laboratory to study the performance and cost of the gas clean-up methods and can be readily integrated into a comprehensive modeling of the entire power plant. Some preliminary result of these flue gas clean-up models will be presented.

35600 **(CRIE-U—87016) Assessment of fertilization effect of fly ash on high-analysis synthetic compound fertilizers. Fertilizer response test using Komatsuna, Brassica campestris L.** Aoki, Masanori; Umezawa, Takeshi; Okabe, Katsumi. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jun 1987. 28p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752541/JAW.

New fertilizers were developed to expand the application of fly ash and complement some shortcomings in physical properties of ammonium nitrate and urea fertilizers. These fertilizers are synthetic compound fertilizers containing three elements produced in such a way that raw nitrogeneous and potash fertilizers are mixed with the phosphoric acid suspension of fly ash and the mixture is granulated or moulded utilizing the spontaneous setup caused by the gelation of silicic acid. The cultivation test of 'Komatsuna', Brassica campestris L., using the fertilizers was made in accordance with the 'Methods of Cultivation Test on Harm to Plants' in the Fertilizer Control Law. The fertilization effect of applying a large quantity of the test specimen of high-analysis synthetic compound fertilizers utilizing fly ash was higher than that of the control fertilizer. No harm to the growth by excessive application was observed. This is because the diffusion of salts from the test specimen is lower than that from the control fertilizer. These fertilizers meet, therefore, the requirements of the Fertilizer Control Law. (4 figs, 7 tabs, 2 refs)

35601 **(CRIE-U—87020) Screening of ground cover crops for fly ash disposal area.** Kono, Yoshihisa; Ogawa, Tadashi. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Sep 1987. 18p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752544/JAW.

Examination was made on the screening of ground cover forage crops for fly ash disposal area. For selecting herbs tolerant to alkaline fly ash, commercially-available forage crops of Leguminosae and Gramineae were cultivated. In Leguminosae, clovers, particularly, white clover exhibited high adaptability to the fly ash rather than to the sand soil, and could grow in the symbiosis with the root nodules. The forage crops of Gramineae were inferior in the growth except for a part of the crops. Even in the case of no volcanic ash face soil layer on the fly ash, the white clover could be cultivated. However, the growth was ununiform, since the seeds flew away or were buried into the ground. The use of a 2 - 5 cm surface soil layer improved significantly the crop growth. In the use of the volcanic ash having no underlayer of fly ash, the growth performance of the crops was inferior after the garmination. For the sowing, the appropriate seed amount was about twice the standard. White clover is applicable for early-covering the fly ash disposal area by using a 2 - 5 cm surface soil layer. (2 figs, 7 tabs, 9 refs)

35602 **(CRIE-W—86025) Characteristics of pressure loss during filtration using a porous ceramic filter.** Ito, Shigeo; Watanabe, Masatoshi; Makino, Hisao; Nagayama, Tsutomu; Tanaka, Takashi. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Apr 1987. 31p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752547/JAW.

Characteristics of pressure loss during filtration was studied using a porous ceramic filter (PF). Immediately after the filtration started, collected particles formed a thin layer on the PF surface, which was transferred to cake filtration. Pressure loss during filtration was expressed as the sum of the loss in the filter and that in the particle layer. The effect of plugged surface pores with fine particles was evaluated as the change of permeability. Increase rate of pressure loss during filtration was proportional to the particle concentration, 2.6 power of the filtration rate and square of the specific surface area. When the filtration rate became larger, however, the porosity decreased and pressure loss increased because the pressure gradient increased in the collected particle layer and the particle layer was compacted. It is necessary to elucidate the compacted properties of collected particle layer to estimate more accurately the pressure loss. (20 figs, 5 tabs, 8 refs)

35603 **(DOE/PC/81006—T2) Aqueous reaction of fly ash and $Ca(OH)_2$ to produce calcium silicate absorbent for flue gas desulfurization.** Peterson, J.; Rochelle, G.T. (Texas Univ., Austin (USA). Dept. of Chemical Engineering). [1988]. Contract FG22-85PC81006. 77p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88010129/JAW.

To examine the effect of slurrying conditions upon solids reactivity, slurries of fly ash and $Ca(OH)_2$ were monitored for dissolved metal concentrations with atomic absorption spectrophotometry. The solids produced were dried and tested for reactivity towards SO_2 in a packed bed reactor at bag filter conditions. The solids formed in slurries containing 10 to 100 ppM of dissolved calcium were up to 40% more reactive than the solids formed in slurries containing less than 10 ppM or more than 100 ppM of dissolved calcium. The dissolved calcium concentration was affected by NaOH concentration, fly ash loading (g fly ashg $Ca(OH)_2$), slurry temperature, fly ash type, and the presence of $CaSO_3$ {center←dot} 0.5 H_2O. High calcium fly ash could be activated to remove 1.3 mmol SO_2g sorbent which is almost as reactive as the

solids prepared by slurrying low calcium fly ash with $Ca(OH)_2$ at a fly ash loading of 4 (1.44 mmol SO_2g). Low and medium calcium fly ashes, under identical slurrying conditions removed only 0.33 mmol SO_2g sorbent.

35604 **(DOE/PC/90524—T2) Chemical degradation of substituted aromatic hydrocarbon compounds in soil/sediment systems: Progress report.** Shanmuganantha, S.; Luthy, R.G. (Carnegie-Mellon Univ., Pittsburgh, PA (USA). Dept. of Civil Engineering). Jan 1988. Contract FG22-86PC90524. 114p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88007108/JAW.

This study investigated the role of manganese oxide as an oxidant for substituted aromatic organic solutes. Manganese oxide may be the most reactive oxidizing agent in soils and sediments in the absence of molecular oxygen and nitrate. The study provides data on chemical mechanisms for abiotic degradation of anthropogenic organic solutes in soilsediment and groundwater systems. The dissolution of MnOOH and δMnO_2 was studied with five nitrogen-containing aromatic compounds and seven alkyl-substituted aromatics under anoxic conditions. Screening tests were performed at several values of pH and initial organic and oxide concentrations, and the rates of dissolution were evaluated. Quinoline, methylimidazole and 5.5-dimethyl hydantoin did not exhibit a significant dissolution rate at pH values around 6.0. Aniline dissolved δMnO_2 readily at a pH value of 4.4 but not at pH = 6.5 in tests with comparatively high initial concentrations (5 {times} 10^{-3}M) of organic and oxide. A methoxy substituent of aniline, p-anisidine, dissolved δMnO_2 very rapidly at low pH (4.4) with comparatively low concentrations of organic (6.25 {times} 10^{-5}M) and oxide (3.25 {times} 10^{-4}M). Hydroquinone, catechol and their alkyl substituents dissolved appreciable amounts of δMnO_2 at pH 6.5, with initial organic concentrations in the range of 5 {times} 10^{-4}M to 5 {times} 10^{-3}M and initial oxide concentrations around 2 {times} 10^{-3}M. An equation is presented which describes dissolution rate (up to about 15% manganese dissolution) for low initial organic concentrations (5 {times} 10^{-4}M and 1.5 {times} 10^{-3}M) with the assumption that the organic soluted are two equivalent reductants. In general, alkyl substitution increased the reaction rate except for trimethyl hydroquinone. Reactivity also increased with the size of the alkyl substituent. 29 refs., 46 figs., 17 tabs.

35605 **(EPRI-CS—5783) Laboratory characterization of advanced SO_2 control by-products: Furnace sorbent injection wastes: Final report.** Eklund, A.G.; Achord, R.D.; Owens, J.B. (ICF Technology, Inc., Richland, WA (USA)). May 1988. 169p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011423/JAW.

This report on the solid waste characterization of furnace sorbent injection wastes is the second in a series of five advanced SO_2 control waste characterization reports reaulting from Task 2 of Research Project 2708-1. Task 2, Solid Waste Characterization, involved a detailed characterization of solid waste products based on literature and property determinations. The chemical, physical, engineering, and leaching properties of furnace sorbent injection wastes will be used to support the evaluation of waste management design and operation and potential utilization in Tasks 3 and 4 of this project. Results indicate that furnace sorbent injection wastes, although varied in chemical composition, can be handled in waste management systems designed for western (alkaline) fly ash. Waste handling systems may require designs for larger volumes and masses of dry wastes. Chemical differences between furnace sorbent injection wastes and fly ash are greater than physical and engineering property differences. Chemical properties may require that waste management systems in which furnace sorbent injection wastes will be exposed to moisture be protected or properly engineered for temperature resistance, corrosion resistance, alkaline liquids, and the possibility of rapid self-hardening. If solids are handled dry, waste management systems may require some modifications to handle finer particles and prevent fugitive dust emissions. 5 refs., 32 figs., 18 tabs.

35606 **(IEACR—05) Particulate control for coal combustion.** Klingspor, J.S.; Vernon, J.L. (IEA Coal Research, London (UK)). Feb 1988. 71p. NTIS (US Sales Only), PC A04/MF A01;1. Order Number TI88900490/JAW.

Although control of particulate emissions from coal combustion systems is a mature technology, a wide range of work is under way to improve the applicability, performance and cost-effectiveness of particulate control equipment. Particulate control technologies in commercial operation for control of emissions form coal combustion sources are mainly mechanical collectors, electrostatic precipitators, fabrics and wet scrubbers. These technologies are described in detail in terms of basic principles, collection mechanisms, performance and costs. The economics of particulate control technologies are considerably influenced by site-specific factors. In general terms, however, they are unlikely to exceed 5 to 10% of total plant captial and annual costs. Whilst cyclones are the cheapest form of particulate control, they are generally unable to meet the strict emission standards now being introduced for large combustion systems. The relative costs of ESPs and fabric filters vary, depending on precise emission standards, coal type, combustion system type and size. High operating costs for wet scrubbers have limited their application in recent years. 156 refs., 24 figs., 17 tabs.

35607 **(PB—88-188073/XAB) Evaluation of the use of power plant pond ash in highway construction.** Sheffield, J.P. (Mississippi State Highway Dept., Jackson (USA). Research and Development Div.). Jan 1988. 77p. (STATE STUDY—85). NTIS, PC A05/MF A01.

The objective of this study is to evaluate power plant pond ash as a base course material. Pond ash consists of fly ash and bottom ash that have been codisposed of by sluicing to a disposal pond. The different base courses containing pond ash are: (1) 6-in. course of fine pond ash and 7% (by weight of pond ash) lime; (2) 6-in. course consisting of 5 parts coarse pond ash and 1 part sand clay plus 7% (by weight of pond ash) lime; (3) 6-in. course consisting of 5 parts coarse pond ash and 1 part sand clay plus 7.5% (by weight of pond ash) portland cement; (4) 8-in. course consisting of 50% each of pond ash and sand clay plus 2% (by weight of pond ash) lime; and (5) 8-in. course consisting of 50% each of pond ash and sand clay plus 6% (by weight of pond-ash) lime. To date, all pond ash courses appear superior to the control section which is an 8 in. course consisting of sand clay mechanically stabilized with washed gravel. The pond ash sections and the control section will continue to be evaluated on an annual basis for three years.

35608 **(RISO-M—2667) Sulphur dioxide reduction in fluidized bed combustion. Part 2. Test of 4 selected types of limestone in Risoes 300 kW fluidized bed.** Kaiser, N.E. (Risoe National Lab., Roskilde (Denmark)). Sep 1987. 20p. (In Danish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752929/JAW.

Reduction of sulphur dioxide in flue gas in fluidized beds by adding limestone has been investigated. 14 different types of limestone have been tested in a laboratory facility. 4 types have been selected for a test in Risoes 300 kW fluidized bed, and 3 types have been tested in dk-TEKNIKs 1MW fluidized bed. Finally one type has been tested in a 12 MW fluidized bed in a district heating station located in Skanderborg. This report describes the tests in Risoes 300 kW fluidized bed.

35609 **(RISO-M—2668) Sulphur dioxide reduction in fluidized bed combustion. Part 4. Full scale test in Skanderborg district heating station.** Kaiser, N.E. (Risoe National Lab., Roskilde (Denmark)). May 1987. 30p. (In Danish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752930/JAW.

Reduction of sulphur dioxide in flue gas in fluidized beds by adding limestone has been investigated. 14 different types of limestone have been tested in a laboratory facility. 4 types have been selected for a test in Risoes 300 kW fluidized bed, and 3 types have been tested in dk-TEKNIKs 1MW fluidized bed. Finally one type has been tested in a 12 MW fluidized bed in a district heating station located in Skanderborg. This report describes the final test in Skanderborg district heating station.

35610 **(RISO-M—2669) Sulphur dioxide reduction in fluidized bed combustion. Final report. Summary of the whole project.** Kaiser, N.E. (Risoe National Lab., Roskilde (Denmark)). Sep 1987. 22p. (In Danish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752931/JAW.

Reduction of sulphur dioxide in flue gas in fluidized beds by adding limestone has been investigated. 14 different types of limestone have been tested in a laboratory facility. 4 types have been selected for a test in Risoe's 300 kW fluidized bed, and 3 types have been tested in dk-TEKNIKs 1MW fluidized bed. Finally one type has been tested in a 12 MW fluidized bed in a district heating station located in Skanderborg. This report is a summary of the whole project.

35611 **(STEV-FBT—87-33) Modelling of the sulphation of calcined limestone and dolomite - A gas-solid reaction with structural changes in the presence of inert solids.** Alvfors, P.; Svedberg, G. (Statens Energiverk, Stockholm (Sweden)). Dec 1986. 53p. (In Swedish and English). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752949/JAW.

The partially sintered spheres model (PSSM) is further developed to account for the influence of inert material present in the solid reactant. This model is applicable e.g. to the sulphation of CaO with a variable amount of inert material. An example is the reaction between calcined dolomite, CaO.MgO and SO_3, when used as SO_2-sorbent in the boiler furnace. The results show that the active part of the sorbent reaches a higher degree of conversion when inert material is present. (authors).

35612 **(STEV-FBT—88-2) Denitrification of flue gases. Final report.** Ekman, T. (Statens Energiverk, Stockholm (Sweden)). Nov 1987. 86p. (In Swedish, German and English). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752954/JAW.

The pilot-plant for denitrification of flue gas which is situated at the Oeresund plant in Malmoe operates on selective catalytic reduction (SCR). The flue gas is taken after particulate and SO/sb2/ removal. It passes a Ljungstroem type regenerative heat exchanger where the gas is heated from 70 degrees C to 300 degrees C. In an electric heater the gas is further heated to 350 degrees C and then divided between two ducts. Four different catalysts, based on V/sb2/O/sb5/ - TiO/sb2/ have been tested, 1500 hours each. The catalysts show a linear relation to the degree of reaction and ammonia addition up to at least 90% reduction. Leakage of ammonia is less than 5ppm. The temperature dependence of catalysts is low and there was no change of catalytic activities after 1500 hours.

35613 **(VTT-TIED—775) Finnish limestone types in desulphurization.** Panula-Nikkilae, E.; Nieminen, M.; Hepola, J. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Oct 1987. 83p. (In Finnish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752996/JAW.

The report includes a survey of limestone characteristics and of the quality of Finnish limestone products, a literature review of additives improving the desulphurization capacity of limestone and a study of pore structure and calcium content analytics. The Finnish carbonate stones are crystalline metamorphosed calcites and dolomites. Their most significant impurities are silica, magnesium and aluminium. In southern and southwestern Finland, calcitic limestone types are mostly found, in northern and eastern Finland dolomite and dolomitic limestone. The characteristics of the most significant limestone products from the three biggest carbonate producers in Finland are presented. The desulphurization capacity of limestone can be improved by using inorganic additives, some per cents of the limestone amount. 1 to 5-fold reaction rates have usually been achieved compared to the use of unpromoted limestone. The most significant additives: chrome, sodium, magnesium, potassium, lithium, iron, and chlorine and the results obtained from their use are presented. Chrome oxide proved to be chemically the most effective, but its use is restricted due to environmental impacts. Alkali metal salts are fairly effective and have only minor drawbacks. Iron and added magnesium are rather ineffective in furnace conditions. Pore structure and chemical analytics of desulphurization materials are closely related to the desulphurization experiments. Different methods suitable for use with experimental desulphurization methods are presented. These methods have in part been obtained from the literature and in part developed in this research work.

35614 **(VTT-TUTK—508) Desulphurization by limestone injection. A study of the reactivity of Finnish limestone grades on an isothermic flow reactor.** Hepola, J.; Nieminen, M.; Panula-Nikkilae, E.; Aeijaelae, M. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Nov 1987. 139p. (In Finnish). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88753004/JAW.

Injection is expected to be a competitive desulphurization method for flue gases. The desulphurization capacity of Finnish limestone grades in furnace conditions was studied on an isothermic flow reactor constructed in the laboratory. The effect of temperature, residence time, flue gas composition and limestone grade, particle size and amount on the calcination and sulphating rate and desulphurization was studied. The effect of small amounts of different metal compounds and ashes on the desulphurization capacity of limestones was also investigated. In calcination tests without sulphur carried out in a flue gas atmosphere equal to that in coal combustion, fine limestone powder was calcinated nearly totally, regardless of limestone type, in some tenths of a second at about 1000 deg C. The calcination was accelerated whilst the particle size of limestone was reduced. Calcium hydroxide was calcinated faster than limestone. The particle size of the limestones was reduced during calcination. The BET areas varied according to limestone coarseness and grade. Simultaneous calcination and sulphating was also studied. There were no greater differences compared to the tests without sulphur. The fine limestone grades bound sulphur more than the coarser ones. The major part of the coarse limestone grades was sulphated in 0.3 s, whilst the desulphurization capacity of finer limestone grades increased more clearly when the reaction time grew to 1 s. The degree of Ca utilization was 10-15% for coarse limestones, 20-25% for fine limestones and about 10% for calcium hydroxide. The SO_2 content and the amount of limestone fed to the reactor had no essential effect on the degree of Ca utilization. There were no greater differences in the desulphurization capacity of different limestone grades.

35615 **Process for the combined removal of SO_2 and NO/sub x/ from flue gas.** Chang, S.G.; Littlejohn, D.; Liu, D.K.; Griffiths, E.A. (to Dept. of Energy, Washington, DC). US Patent 4,732,744. 22 Mar 1988. Filed date 27 Oct 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A process of the simultaneous removal of NO/sub x/ and SO_2 from a fluid stream itself comprised of NO/sub x/ and SO/sub x/, is described which comprises: (A) contacting the fluid stream in a contacting zone with an aqueous reaction mixture itself comprising an effective amount of an iron (II) chelate of an amino acid moiety having at least one -SH group selected from amino acids, N-substituted amino acids, natural peptides and synthetic peptides, and an alkali which comprises a basic salt selected from the salts of sodium, potassium, lithium, calcium or magnesium, (B) separating the fluid stream from the particulates formed in step (A) which particulates comprise the chelate of the amino acid moiety and fly ash; (C) washing with the particulates of step (B) with a relatively neutral aqueous solution having a pH of between about 5 and 8 with subsequent separation of the aqueous wash and the particulates; (D) subsequently washing the particulates of step (C) with an acidic aqueous solution of a mineral acid; (E) washing of the particulates of step (D) with an alkaline aqueous solution having a pH of between about 9 and 12 with subsequent separation of the aqueous wash and the particulates; (F) adding additional amino acid moiety, iron (II) ion, and an alkali which comprise a basic salt selected from the salts of sodium potassium, lithium, calcium or magnesium to produce an effective concentration of chelating aqueous solution or slurry having a pH of between about 4 to 12; and (G) recycling the aqueous solution of step (F) to the contact zone of step (A).

35616 **An analytical study of coal-fired boiler performance using CO_2O_2 or $CO_2O_2H_2O$ mixtures instead of air as oxidizers.** Richter, W.; Li, W.; Payne, R. (Energy and Environmental Research Corp., Irvine, CA (US)). pp 1989-1996 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—).

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879067.

The paper deals with a process in which mixtures of recycled combustion products CO_2 or CO_2H_2O and O_2 from air separation are used as oxidizers instead of air to support combustion in boiler furnaces. The process can be applied to generate CO_2 for enhanced oil recovery. The feasibility of the process is investigated for an existing 50 MWe lignite fired boiler using a Monte-Carlo type heat transfer zone model. Optimum oxidizers molar ratios were determined which yielded most similar thermal performance of the boiler compared to air operation. The ability of the model to predict accurately relative performance changes between air and recycling operation was verified by model application to small-scale experiments. Results of the study show that optimum molar ratios for the boiler investigated are $CO_2O_2 = 2.7$ for the dry and $(CO_2 + H_2O)O_2 = 3.2$ for the wet recycle process. Within a range +- 0.4 of the optimum ratios performance changes are minimal compared to air operation.

35617 **(DOE/PC/90753—T8) Coal ash deposition, interaction with metal substrates and deposit build up.** Birks, N. (Pittsburgh Univ., PA (USA). Dept. of Materials Science and Engineering). 1988. Contract FG22-86PC90753. 13p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011920/JAW.

It is believed that the corrosive action of coal ash is primarily due to the formation of liquid phases. As such, initial experiments have been applied to demonstrate that, in the presence of a liquid phase, the attack is more pronounced, and also that in the absence of a liquid phase, very little attack beyond normal oxidation occurs. The results from the study showed that during reaction of the ash/slag with the atmosphere, compositional changes can occur within the coating that may affect the chances of liquid formation. It was also found that it was not sufficient for the coatings to have a low melting point, they must also form a liquid of relatively low viscosity to show very rapid attack. Future activities will pursue this line of research extending the studies to higher temperatures as well as beginning to incorporate representatives of coal minerals into the ash powder to be applied to the specimens. Eventually, a mechanistic model of the processes will be derived.

35618 **(NEI-SE—10) Environmental effects of methane production from peat in situ.** Wallentinus, H.G. (Lund Univ. (Sweden). Dept. of Geology). 26 Jan 1987. 19p. (In Swedish). NTIS (US Sales Only), PC A03. Order Number DE88752921/JAW.

The vegetation at the Kallbrunnsmossen - a bog exploited for in-situ methane production - has been analyzed since 1983. Water samples are also taken at several points across the bog. Visible damage is produced by mechanical wear from transports etc. Certain chemical/ physical parameters have varied considerably over the years, i.e. pH, water color and conductivity. Significant changes in vegetation are also noted.

35619 **(NAGRA-NTB—87-15, pp 535-542) Coalification and geothermics in Meso- and Paleozoic sediments of Northern Switzerland and comparison to coalification data from Southern Germany.** Wolf, M.; Hagemann, H.W. (Technische Hochschule Aachen (Germany, F.R.)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

Coalification studies were carried out on samples of the boreholes Schafisheim, Riniken and Weiach (Northern Switzerland). They show a relative high rank of the coals of Stephanian age explored by the Weiach borehole. The phenomenon is explained by unnormal high heating of the seams during the late Palaeozoic. The sediments of Mesozoic age have more or less the same rank in northern Switzerland, although they are situated today at different depth. The coalification process of these sediments must have been finished before the last tectonic events occurred. A similar development of temperatures and rank is derivable for the Palaeozoic and Mesozoic of the Schramberg trough, explored by the borehole Urach 3. The structure of this trough, situated in south Germany, is similar to the Permocarboniferous trough of northern Switzerland. (author) 12 refs., 1 fig., 4 tabs.

35620 **(STEV-TORV—87-16) Follow-up of operation and production studies of sod peat machines during 1986 - HUDDIG HPM 100 and SUOKONE PK 1 - WANKEL.** Westermark, N.E.; Ericsson, E.; Anttila, R.; Dryler, K. (Statens Energiverk, Stockholm (Sweden)). Feb 1987. 47p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752965/JAW.

In production on fields free of stumps, HPM 100 has lower capacity than PK1-S with the new disc in relation to supplied power (in kw). The extruder on HPM 100 is the limiting factor. This is driven by the motor mounted on the machine. If too high power is supplied to the excavator disc by the tractor it fails to press out the whole amount of peat. In production on fields rich in stumps HPM 100 has a higher production than PK1-S with the new disc. This depends on the better cutting qualities of the disc and on the fact that the excavator disc can be reversed by hydraulic drifting. The drying periods for the excavated peat seems to be of about the same order for all the tested machines with perhaps a small tendency for shorter drying periods in the second harvest for HPM 100. The produced amount of peat per spreading area without overlapping, is less with HPM 100 than PK1-S. The excavating capacity with the new disc on PK1-S seems to increase with increased driving speed and increased supplied power while the highest capacity with HPM 100 is reached with lower speed (less than 2000 m/h). The fuel consumption with HPM 100 has varied between 24.5 l/h and 29.9 l/h (including driving tractor). For PK1-S with the new disc the corresponding value was 13.2 l/h. With fuel consumption expressed per ton of raw peat the consumption for HPM 100 was 0.30 l/ton raw peat (1.77 l/ton dry matter) and for PK1-S with the new disc 0.25 l/ton raw peat 1.26 l/ton dry matter). PK1-S with the new disc consequently had the lowest fuel consumption per produced unit as well as the largest volume of produced raw peat in this study. (authors).

35621 **(STEV-TORV—87-17) Technique of reducing losses of material and substances on piling and storing of peat.** Anttila, R. (Statens Energiverk, Stockholm (Sweden)). Sep 1987. 56p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752966/JAW.

Swedish Peat Research Foundation has investigated piling and storing of peat during two years. The project has been carried out by Scantorv AB (former Svensk Torvfoeraedling) and the secretariat office of Swedish Peat Research Foundation in which Kent

Dryler has been responsible for parts concerning material losses in stockpile bottom and surface. The objective of the project is to elucidate kinds of technical problems occurring when piling and storing peat and to find methods for decreasing substance- and energy losses, fire hazard, and costs for piling and covering piles. The presented results have been obtained by literature studies, collection of experiences and field experiments. Evaluation of the result shows that heat-generation and fire hazard do not mean any greater problem for the peat producers. Losses in many forms are occurring more or less and should be reduced to the greatest possible extent for achieving good production economy. Areas desired for development of new technology is technology and machinery for piling and material and technology for covering piles. Recommendation for piling have been drawn up and are described in the report.

35622 **(STEV-TORV—88-5) Follow-up of operations and machine studies of a stacking device.** Olsson, R. (Statens Energiverk, Stockholm (Sweden)). Mar 1987. 42p. (In Swedish). NTIS (US Sales Only), PC A03. Order Number DE88752970/JAW.

A mixed system with combined milled and sod peat production has been carried out on Anttjaernmyran. This bog is situated in the community of Oeverkalix in the north part of Sweden. A stacking machine equipped for both screening and stacking was used for sorting out and piling milled and sod peat in different stockpiles. When using a stacking machine following has been registered among other things: - decreased moisture content with 8% in sorted sod peat. That means increased energy value with 18%. - increased amount of coarse fraction (>45mm) with 31%-units in sorted sod peat. - decreased amount of fine fraction (<3mm) with 17%-units in sorted sod peat. The stacking machine has good degree of screening and availability and satisfying capacity after modification of parts in the machine. Based on this study and SST-project with the title 'Combination system milled and sod peat', it is indicated that the draft gives a positive margin calculated on a normal production year. The combined production system will continue with almost the same draft going on during the production season 1987.

35623 **(DOE/PC/90958—T4) Study of dense phase cohesive coal transport in plugs: Quarterly report, January-March 1988.** Klinzing, G.E. (Pittsburgh Univ., PA (USA). Dept. of Chemical and Petroleum Engineering). 1988. Contract FG22-86PC90958. 11p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010308/JAW.

The experiment for single plug flow conveying was performed Pittsburgh and Virginia coals. Early attempts to use a mixture of 90%-200 Mesh coal powder are not successful. After sifting the coarse particle out, the plug stability was increased significantly. The method of supplying the conveying air is also important. Early attempts to supply the conveying air supply slowly were not successful. The plug collapsed after less than 10 feet. Thus, the method of supplying the air supply slowly is suitable for the short distance conveying less than 10 feet only. Then the conveying air was supplied by a quick opening through a solenoid valve. For this arrangement the coal can be transported for a distance 40 feet. To date we have completed the experiments for the pipe length of 20 feet. Figure 3 and 4 show the preasure drop vs. initial plug length at different air velocities for Pittsburgh and Virginia coals. We have not used the model yet to predict the pressure losses because as it was observed that the rear of the plug kept breaking off from the main plug and depositing in the bottom of the pipe. Thus, the initial plug length is not the actual plug length. We will use the light probe system to measure the actual plug length and the model will be applied properly. 5 figs.

(UKAEA Harwell Lab. Engineering Science Div.). Feb 1988. 19p. (HCCP/R—10-1987; CONF-880802—). H.M. Stationery Office, London, price Pound 4.00.

From 22. international symposium on combustion; Seattle, WA, USA (14 Aug 1988).

Laser-Doppler anemometry (LDA), laser sheet illumination and coherent anti-Stokes Raman spectroscopy (CARS), used previously for natural gas and kerosene flames, have now been applied to a laboratory gas-supported coal flame. The main objectives were to assess the optical techniques and to identify any experimental problems before using the instruments on larger coal flames. Measurements using the three techniques were made in characteristic regions of the flame, corresponding to the gas flame, and the unburnt and devolatilised coal jets. The main conclusion is that LDA and CARS can be applied successfully and the measurements of mean axial velocity and turbulence intensity (LDA) and temperature (CARS) are consistent. The CARS software did however have to be modified to reject spectra dominated by signals produced by interactions between coal particles and the laser beams at the measurement volume. The laser sheet illumination enabled relative particle concentration in the inner coal jet to be mapped, but it was not possible to obtain particle velocities using the available laser system.

35625 **(DOE/METC—88/6084-Vol.1) Proceedings of the AR&TD [Advanced Research and Technology Development] direct utilization, and instrumentation and diagnostics contractors review meeting: Volume 1.** Holcombe, N.T. (ed.). (USDOE Morgantown Energy Technology Center, WV; USDOE Pittsburgh Energy Technology Center, PA). Oct 1987. 388p. (CONF-871041—Vol.1). NTIS, PC A17/MF A01;1; GPO Dep. From Advanced research and technology development direct utilization; Morgantown, WV, USA (13 Oct 1987).

The Advanced Research and Technology Development (AR&TD) Direct Utilization, and Instrumentation and Diagnostics Contractors Review Meeting was held on October 14-16, 1987, at the Sheraton Lakeview Conference Center in Morgantown, West Virginia. This meeting was sponsored by the US Department of Energy (DOE), Office of Fossil Energy, and the Morgantown and Pittsburgh Energy Technology Centers, and this year was hosted by the Morgantown Energy Technology Center. This annual meeting provides a forum for the exchange of information between DOE AR&TD contractors and interested parties and was attended by approximately 200 individuals from industry, academia, national laboratories, and other Governmental agencies. Papers were presented on ongoing research and research results relating to combustion phenomena, coal properties, cleanup, mineral-matter transformations, pyrolysis, atomization, instrumentation, erosion/corrosion, and deposition. A total of 12 technical sessions were chaired by staff from both the Morgantown and Pittsburgh Energy Technology Centers. Conference coordination was provided by the Conference Services staff of EG&G Washington Analytical Services, Inc., Morgantown Operations. The proceedings have been reproduced from camera-ready manuscripts furnished by the authors. They have not been refereed, nor have they been extensively edited. Papers have been entered individually into EDB and ERA.

(Electric Power Research Inst., Palo Alto, CA (USA); Southern Research Inst., Birmingham, AL (USA)). May 1988. 202p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011431/JAW.

Experience with fluidized bed combustion (FBC) units on a research and industrial scale has indicated that FBC power plants

could be a viable alternative to pulverized-coal power plants with wet limestone scrubbers or spray dryers. To provide design confidence and the flexibility to evaluate process improvements, the Tennessee Valley Authority constructed a 20-MW(e) AFBC (bubbling bed) Pilot Plant. Subseqently, EPRI and Southern Research Institute entered into a program to monitor the performance of the fabric filter at the pilot plant. The objective of the program was to determine if unique characteristics of AFBC operation or emissions would require special design criteria or operating procedures in the application of fabric filtration to utility-size AFBC boilers. With reverse-gas cleaning the fabric filter experienced high tubesheet pressure drop while operating at low filtering air-to-cloth values and with low residual dustcake areal densities compared to fabric filters downstream from pulverized-coal boilers. This implied that the AFBC fly ash had properties distinct from those of pulverized-coal fly ash. Implementaion of reverse-gas cleaning with sonic assistance resulted in lower operating pressure drops at higher filtering air-to-cloth values, although slightly higher than comparable data from baghouses filtering pulverized-coal fly ash. Fly ash analyses showed that the AFBC ash particles are generally smaller, more irregualr in shape, and the dustcakes are lighter and more porous than those formed from pulverized-coal fly ashes. 8 refs., 18 figs., 7 tabs.

35627 **(KTM/E-D—138) Measuring methods for emissions from small and middle size boilers.** Laukkarinen, A.; Tirkkonen, T.; Jormanainen, P.; Puustinen, H.; Mehtonen, A.; Wellman, K. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). Aug 1987. 75p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752826/JAW.

This study describes measuring methods for emissions from small and middle size boilers. Emissions from these boilers differ from emissions from large boilers, especially concentration of organic compounds and unburn gases are much higher. There was a need to develop new methods and to apply other methods which are mostly used for another purpose. Burning of peat, wood and expecially wood-based waste, f.ex. chipboard forms great number of compounds which are measured by different absorption and adsorption methods. In this study adsorption materials were tested and the tests shows, that it is possible to utilize one adsorption sample for several analyses. For tar measurements were developed a new rapid and simple method, which can be used for preliminary tests before comprehensive measurements. There are several methods for analyses of unburn gases. Because of numerous methods, results are not comparable. In this study was compared several methods for unburn gases with gas mixtures and with exhaust gases. It is obvious, that whoever measures unburn gases should know, what the instrument really measure and how the results will be used. Sulfur compounds in stack gases can cause significant errors in particulate measurements. Any condensation of water vapor on filter can affect a 100% error in particulate measurements. Duration of sampling dont have any measureable impact on the doncentration level.

35628 **(NEI-DK—59) Status and outlook for the technology of fluidized bed combustion. Preliminary project for the Danish Ministry of Energy.** Laut, P. (Danmarks Ingenioerakademi, Lyngby). Apr 1987. 100p. (In Danish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752834/JAW.

The Danish research activities in the field of fluidized bed combustion are evaluated in the light of the international development, taking into account the specific Danish conditions and requirements. The report is meant as a contribution to a debate going on once a year as to whom is to receive grants from the Danish Ministry of Energy for research projects on fluidized bed combustion. (HES).

35629 **(PB—88-184221/XAB) Modeling of char burnoff.** Hustad, J.E.; Vareide, D.; Soenju, O.K. (SINTEF, Trondheim (Norway)). Oct 1987. 44p. (STF—15-A87055). NTIS, PC E04/MF E04.

Two idealized models for the prediction of char burnoff are described: a progressive conversion model and a shrinking-particle models. Results from the model predictions are presented. Experiments were performed in a-250 kW fluidized-bed reactor, using propane as loading fuel. Studies of char burnoff are made in the freeboard region at various height locations. The char particles are fed into the reactor just above the bed section. The 4-m-high freeboard section allows particle residence time at up to 4 s. The char particle size varies from 90 to 268 micrometers and the temperature in the freeboard section range from 820 to 940 C. The oxygen concentration varies from 8% to 13.5%. The report was presented at a Combustion Seminar in Hensinki on the 12th of November 1987, organized by the Royal Nordic Council of Ministers.

35630 **(STEV-FBT—87-31) Reaction kinetics of the combustion of pulverized coal. Particle temperature.** Hellstroem, A. (Statens Energiverk, Stockholm (Sweden); Studsvik Energiteknik AB, Nykoeping (Sweden)). Jun 1985. 56p. (In Swedish). (STUDSVIK-EB—85-50). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752948/JAW.

The theory of particle combustion is described and a mathematical model for the calculation of the temperature is presented. The calculations are compared with existing empirical data. The measurement of the temperature of small particles is described.(G.B.).

35631 **(UCRL—21039) Tubing wastage in fluidized-bed coal combustors: Test Series 2 NCB (IEA Grimethorpe) Ltd.** Witherell, C.E.; Meisenheimer, R.G. (Lawrence Livermore National Lab., CA (USA)). 8 Jan 1988. Contract W-7405-ENG-48. 69p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88009810/JAW.

This study of wasted heat-exchanger tubing from the Grimethorpe PFBC Facility was conducted to characterize affected fireside surfaces and identify the mechanism/s responsible. Examinations showed that the wasted surfaces are not typical of those produced by erosion alone, as oxide deposits are present on all surfaces. Continual exfoliation of the normally-protective oxide layer is probably responsible for a major portion of tubing wastage. There are also indications of direct metal loss occurring through a series of events wherein repeated formation and exfoliation of surface oxides produce an irregular metal interface that is mechanically deformed during combustor operation. Cold-worked metal protrusions, or platelets, on the roughened surface readily fracture from the tubing wall and are lost into the bed. In some combustors where metal temperatures generally are above 600 C (1100 F), sulfidation-oxidation corrosion has been identified as the mechanism responsible for metal loss. These occurrences have largely been confined to air heater tubes, uncooled support members, and the like. However, the more perplexing type of metal wastage in FBCs{endash}and that which is the subject of this study{endash}has occurred at much lower metal temperatures of about 400 C (750 F) in in-bed water-cooled tubes. There have been differences of opinion over its cause but the consensus is that erosion is a major factor, if not the sole cause. Examinations have shown that wasted surfaces of heat exchanger tubing from this combustor are the product of combined mechanical, chemical, and thermal effects, all interrelated to produce rapid and localized metal loss. 33 refs., 29 figs., 3 tabs.

35632 **(VTT-TUTK—499) Energy production from peat.** Pesonen, P.; Hallikas, J.; Asplund, D. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Sep 1987. 94p. (In Finnish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753001/JAW.

A method has been developed in order to make it possible to evaluate energy production chains for allocation of research. The method has been applied to comparison of district heating chains (effect 3-10 MW) which use peat as fuel. The energy production chains to be compared are on different technical levels: some of them are commercially available and the rest may be in commercial use within 5-20 years. The chains have been planned to be operating entities themselves, which has required the choice of equipment and the compatibility of the whole process. As a result we have received technical characteristics and the price of heat. On the basis of these we have drawn conclusions about the problems of the energy chains and about the possibilities of further research. In ad-

dition, the usability of the method has been evaluated and it has been found very good.

35633 **Multiple monitoring of an entrained flow reactor.** Woodruff, S.D.; Combs, R.J. (Dept. of Energy, Morgantown, WV (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

A multi monitor has been developed to simultaneously measure gas temperature, particle temperature, and atomic concentrations through one set of optical access ports on a high temperature, high pressure entrained flow reactor. The three measurements continuously monitor the gas and particle flow in a reactor designed to characterize the combustion and deposition of powdered coal. The gas temperature is measured by scanning the OH radical emission at 307 nm, the particle temperature is measured by high speed, multi color pyrometry, and the atomic concentrations are measured by atomic adsorption. The multi monitor uses fiber optics to allow the three measurements to share a single lens and relay the optical data from the lens to the instrument.

35634 **Toward a mechanistic theory of net deposit growth from ash-laden flowing combustion gases: Self-regulated sticking of impacting particles and deposit erosion in the presence of vapor deposited - Or submicron mist - 'Glue'.** Rosner, D.E.; Nagarajan, R. (High Temperature Chemical Reaction Engineering Lab., Dept. of Chemical Engineering, Yale Univ., New Haven, CT (US)). pp 289-296 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

What determines the fraction of impacting 'ash' particles actually captured by a growing deposit? Based on the available literature, the answer to this important question is still largely unavailable. Simultaneous deposition of lower melting point compounds, present as vapors (or submicron mists), evidently provides a 'glue,' influencing many thermophysical properties of such deposits, including the incident particle sticking fraction, s, itself, as well as the particle erosion coefficient, e, (the average number of deposit particles removed per impacting particle). The authors outline here a new mechanistic approach to the mathematical modeling of deposit evolution. It is based on the notion that because of this glue/particle 'coupling,' the net inertial particle deposition rate cannot be calculated 'directly' but will seek a (quasi-)steady-state value such that the available glue will, as it were, 'allow' the impacting particles to be captured (and, simultaneously, dictate the deposit erosion rate). They illustrate how this concept of self-regulation would establish the (quasi-)steady-state values of s and e, and the (corresponding) net deposit growth rate under conditions representative of a pulverized coal combustion heat exchanger tube.

35635 **(CONF-8710324—) Appalachian coal: Meeting international energy needs.** (Virginia Coal Council, Richlands (USA)). 1987. Contract FG01-87FE61384. 308p. NTIS, PC A14/MF A01;1; GPO Dep. Order Number DE88010815/JAW.

From Appalachian coal: meeting international energy needs conference and exposition; Roanoke, VA, USA (27 Oct 1987).

The conference "Appalachian Coal: Meeting International Energy Needs"was held at the Hotel Roanoke, Roanoke, VA, October 27-29, 1987. The proceedings deal with the present problems of the appalachian coal industry: overcapacity rail transport charges low oil prices and competition from Australia, South Africa, Colombia, etc. Similarly, the railways are not making enough money to pay for installations, and new equipment they have to make, due largely to competition from trucks. The material was not susceptible to analytics and a person interested in one part would probably be interested in the whole proceedings. (LTN)

35636 **(DOE/EIA—0513) Changing structure of the US coal industry 1976-1986.** (USDOE Energy Information Administration, Washington, DC). 1988. 36p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011881/JAW.

This report analyzes changes in the structure of the U.S. coal industry from 1976 through 1986, the most recent year for which comprehensive data are available. The merger activity is continuing, however, and two major mergers occurred in 1987. The effects of these and other recent mergers and divestitures on the structure of the coal industry were estimated. Taken together, they do not have a significant impact on coal production concentration and coal ownership patterns.

0160 Health And Safety

35637 **(IOM-TM—87-09) Dust-related risks of radiological changes in coalminers over a 40-year working life: report on work commissioned by NIOSH.** Hurley, J.F.; MacLaren, W.M. (Institute of Occupational Medicine, Edinburgh (UK)). Dec 1987. 70p. Institute of Occupational Medicine, Edinburgh, Scotland.

This study provides estimates of the prevalence of simple pneumoconiosis (CWSP) and of progressive massive fibrosis (PMF) in coal miners at eight successive five year periods of a forty year working life. The effect of varying the dust concentration exposure and carbon content of coal for various combinations of age is estimated. The findings of this report state that the limitation of dust exposures for all miners is the only reliable way of limiting PMF.

35638 **(IOM-TM—87-20) Mortality study of workers at a patent fuel plant.** Smith, T.A.; Hurley, J.F.; Henriksen, V.J.B.; Kidd, M.W.; Ruckley, V.A. (Institute of Occupational Medicine, Edinburgh (UK)). Dec 1987. 76p. Institute of Occupational Medicine, Edinburgh, Scotland.

The main purpose of the study was to determine the association, if any, between occupation at the patent fuel plant in South Wales and subsequent cause-specific mortality. Men in Wales of similar age distribution were used as a control group. 37 refs., 6 figs., 17 tabs.

35639 **(KTM/E-D—135) Safe production and use of domestic fuels. Final report.** Mutanen, K.; Linna, V.; Nissinen, K.; Rautalin, A.; Reunanen, M.; Rouhiainen, V.; Weckman, H. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). 1987. 108p. (In Finnish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752823/JAW.

The aim of the project is to improve the safe use of domestic fuels. In a follow-up study it was found out that in 26 power plants there had occured on the average 0.9 fires per operting year having caused material damages and interruptions in operation during years 1984-1986. According to prestudies the corresponding figure in 1979-1983 was 2 per year. Security risks and the possibilities to remove them were reserched through different security analysis methods. The explosion chracteristics were researched by carrying out explosion tests with peats of different humidity and particle sizes in a test drum of 20 litres. The biggest explosion pressure measured was about 10 bar and the K/sub st/-value was 183 bar .ms. In these tests it was also found out that the explosivity of peat cannot be forecast only by the overage humidity and particle size. There are adequately quick and sensitive sparkle alarm devices for observation of peat fires on mechanical conveyors. Gas alarm devices were found out to be suitable for controlling fires in fuel storages. Gas alarm devices should, however, be further researched because of faulty alarms.

35640 **(NEI-DK—79) Fire prevention in coal grinding plants, including their storage and transport systems of coal fines.** (Dansk Brandvaerns-Komite, Birkeroed). Sep 1987. 83p. (In Danish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752919/JAW.

The report contains a short description of the different types of coal grinding plants, the causes of fires and explosions in these, together with principles for plant protection. These are expanded to give more concrete recommendations for protection of coal grinding plants. An initial section on fire extinguishing equipment is followed by recommendations for protection of the different parts of the plant, such as raw coal bins, raw coal feed systems, grinder/pulverisers, cyclones, pulverised coal bins and pulverised coal pipe systems. A special section is devoted to recommendations for protection of transport tanks and containers for pulverised coal. In the final part of the report, an evaluation of the risk of coal dust explosions during coal grinding is carried out, based on a statistical treatment of accident reports. This evaluation is based on information obtained from a questionnaire sent to Danish power stations and industry, together with information obtained from abroad. 47 refs.

35641 **(VTT-TIED—787) Safe production and use of domestic fuels. The development of safe peathandling systems.** Nissinen, K.; Vuori, M.; Mutanen, K. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Nov 1987. 77p. (In Finnish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752997/JAW.

The aim of the study is to evaluate the safety of different fuel handling equipments and the whole handling systems and to search for new and better solutions. The research was limited to the handling process in a peat power plant. The most harmful fact was that peat dust collects into fuel handling rooms. This increased the danger of fires and explosions. Leakages were found in peat handling chains due to fast wearing. Also the large quality variations of peat caused security problems. No dust problems occurred when a gavered drag chain conveyor was used. The fuel feeding equipment for the boiler was the most sensitive object and caused 21% of all fires. The fire safety of power plants can be improved by preventing the dust from spreading into the environment and by cleaning the rooms often. The fire alarm boxes and sprinklers can also be improved. Hidden dangerous factors can be determined by risk analyses and eliminated in advance. On the basis of the information received from the statistics and the research of real damages, safer power plants can be constructed.

35643 **(SI-R—860147-1) AI in offshore. A survey.** Arff, S.; Larsen, K.A. (Senter for Industriforskning, Oslo (Norway)). Mar 1987. 33p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752847/JAW.

The report presents an overview of Artificial Intelligence (AI) applications in the offshore sector: both current status and future potential. A survey of existing AI-systems in the offshore oil industry is presented. 30 refs., 1 table.

35644 **(UCRL—53859-87) Energy Program annual report.** Borg, I.Y. (ed.). (Lawrence Livermore National Lab., CA (USA)). Feb 1988. Contract W-7405-ENG-48. 41p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011706/JAW.

The national economy is particularly dependent on efficient electrical generation and transportation. Electrical demand continues to grow and will increasingly rely on coal and nuclear fuels. The nuclear power industry still has not found a solution to the problem of disposing of the waste produced by nuclear reactors. Although coal is in ample supply and the infrastructure is in place for its utilization, environmental problems and improved conversion processes remain technical challenges. In the case of transportation, the nation depends almost exclusively on liquid fuels with attendant reliance on imported oil. Economic alternates—synfuels from coal, natural gas, and oil shale, or fuel cells and batteries—have yet to be developed or perfected so as to impact the marketplace. Inefficiencies in energy conversion in almost all phases of resource utilization remain. These collective problems are the focus of the Energy Program. In this report, the individual programs making up the Energy Program are grouped into three sections: Nuclear Energy, Fossil Energy, and Nonfossil Energy. Nonfossil Energy research includes work on the aluminum-air fuel cell, geothermal research, combustion chemistry, and abrasion studies relating to energy conversion processes and fuel transportation. Throughout this report, the individual programs are first described in terms of their objectives and accomplishments, and then publications reporting on the year's progress are listed.

35645 **(CMI-R—872330-3) Models for petroleum field optimization.** Haugland, D.; Hallefjord, Aa.; Asheim, H. (Christian Michelsens Inst. for Vitenskap og Aandsfrihet, Bergen (Norway)). Sep 1987. 37p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752811/JAW.

This paper presents some optimization models for an early evaluation of a petroleum field. Based on crude assumptions about a reservoir, our models are to suggest decisions concerning platforms capacity, drilling program and production. We start out with a simple production planning model using linear programming. By mixed integer programming techniques the model is gradually extended. The most sophisticated version of the model can propose platform capacity, where and when wells should be drilled, and the prduction from the wells. The models are tested on numerical examples, and the results are discussed. From the experiments we conclude that the problems are very hard to solve, and that the size of problems that can be solved is limited by the computational burden. Finally, we give some ideas for future work that may provide better solution methods. 16 refs., 7 figs., 1 table.

0202 Geology And Exploration

35646 **(DOE/MC/20037—T1) Arctic ice island and sea ice movements and mechanical properties: Fourteenth quarterly report, 1 January 1987-31 March 1987.** Sackinger, W.M.; Jeffries, M.O. (Alaska Univ., Fairbanks (USA). Geophysical Inst.). 1987. Contract AC21-83MC20037. 31p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88004267/JAW.

The research program on ice islands has four elements: (1) through the use of satellite imagery, historical records, and aerial photography, to establish a time history of all of the Arctic ice shelves, and thus an historically verified source for ice islands; (2) to establish postioning buoys on the known existing ice islands to track their trajectories daily and to telemeter daily barometer pressure and temperature, via System Argos; (3) to calculate geostrophic winds from global pressure maps and barometric pressure data from the buoys, and relate the observed ice island trajectories to the winds and the internal pack ice forces; (4) to construct a model for ice island motion which will enable a determination of the probability of interaction between ice islands and offshore structures, and which will be verified by comparsion with the experimentally observed trajectory data. Research activities covered in the fourteenth quarter include; ice islands (buoy operation and ice island motion); and mechanical properties of sea spray ice bonds to structures. 2 figs., 6 tabs.

35647 **(DOE/METC—88/0260) Arctic and offshore research: Technology status report.** (USDOE Morgantown Energy Technology Center, WV). Jan 1988. 44p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88001027/JAW.

This report describes the state of technology relative to the production of oil and gas in the Arctic. It discusses the technical issues that warrant investigation, and focuses on the current Department of Energy supported activities. Major accomplishments during the last year include the following: The Arctic and Offshore Research Information System (AORIS) was planned with industry survey recommendations incorporated. It contains a directory of 85 Arctic databases, a bibliographic component of over 7,000 citations, and a data component of about 300 data sets on sea ice characteristics. Seven position, pressure, and temperature buoys were deployed on ice islands (up to 3 by 6 miles in size) drifting off Ellesmere Island. Ice island movement, as much as 340 miles southwest of the Ward Hunt Ice Shelf during the last 4 years, represents a potential hazard to Arctic offshore structures in the Alaskan Beaufort Sea. The redesigned Seafloor Earthquake Measurement System (SEMS II) was deployed near Shell's Ellen-Elly platforms, about 10 miles offshore of Long Beach, California. The SEMS monitored the July 1986 southern California earthquakes. This was the first time earthquakes were simultaneously monitored by sensors located on land, aboard offshore platforms, and beneath the seafloor. Sea spray ice bond shear strength to various structural and protective coatings has been determined. The polyethylene coating demonstrated the most potential for rapid shedding of spray ice by gravity loading. Measurements of temperatures and salinities were completed as part of a pilot test to (1) detect seasonal conditions at the water-seabed interface, and (2) determine how they influence permafrost growth in the coastal waters of the Beaufort Sea. The temperatures and computed freezing point data suggest that seasonal seabed freezing can occur most of the winter. 13 refs., 14 figs., 4 tabs.

35648 **(LA-UR—88-1533) Alcohol fuel use: Implications for atmospheric levels of aldehydes, organic nitrates, pans, and peroxides: Separating sources using carbon isotopes.** Gaffney, J.S.; Tanner, R.L. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 6p. (CONF-8804137—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88010952/JAW.

From CRC-APRAC methanol fuel vehicle workshop; Orange, CA, USA (19 Apr 1988).

We have developed DiNitroPhenylHydrazone (DNPH) derivatization--high performance liquid chromatographic methods for measuring aldehydes in ambient samples with detection limits of approximately 1ppbV. These methods can be used for air or precipitation studies, and have been used for indoor measurements at much higher levels using shorter integration times. We are using gas chromatographs with electron capture detection (GCECD) to measure ambient levels of peroxyacyl nitrates and organic nitrates. Diffusion tubes with synthetically produced organic nitrates in n-tridecane solution are used to calibrate these systems. These compounds are important means of transporting NO/sub x/ over large scales due to their reduced tropospheric reactivity, low water solubilities, photolytic, and thermal stability. Their chemistries are coupled to aldehyde chemistry and are important greenhouse gases as well as phytotoxins. We have completed preliminary studies in Rio de Janeiro examining the atmospheric chemistry consequences of ethanol fuel usage. The urban air mass has been effected by the direct uncontrolled usage of ethanolgasoline and ethanoldiesel mixtures. We are exploring the use of luminol chemiluminescent detection of peroxides using gas chromatography to separate the various organic and inorganic peroxides. These compounds are coupled to the aldehyde chemistry, particularly in remote chemistries downwind of urban sources. 13 refs.

35649 **(NUREG/CR—5130) Bentonite borehole plug flow testing with five water types.** Gaudette, M.V.; Daemen, J.J.K. (Arizona Univ., Tucson (USA). Dept. of Mining and Geological Engineering). Apr 1988. 210p. NTIS, PC A10/MF A01 - GPO;1. Order Number TI88009566/JAW.

The hydraulic conductivity has been determined of plugs constructed with commercial precompressed bentonite pellets. Bentonite has been hydrated and tested with waters of five different chemical compositions, including one groundwater (Ogallala aquifer, Texas). The groundwater contained a significant amount of solids: waters prepared in the laboratory did not. Prepared waters used for testing included distilled water, a high (1000 ppM) and a low (45 ppM) calcium solution, and a 39 ppM sodium water. Uncompacted plugs were constructed by dropping bentonite tablets into waterfilled cylinders, or by mixing powdered bentonite with preselected water volumes in order to obtain controlled initial water contents. The hydraulic conductivity of all plugs tested with all waters would result in a classification of practically impervious, by conventional soil mechanics standards. Variations of several orders of magnitude of the hydraulic conductivity are observed.

35650 **(UCID—21243) Petroleum geochemistry: Annual report.** Burnham, A.K.; Braun, R.L.; Sweeney, J.J. (Lawrence Livermore National Lab., CA (USA)). Oct 1987. Contract W-7405-ENG-48. 41p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008973/JAW.

In recent years, integrated basin analysis has been created to address the interdisciplinary issues related to whether a trap is likely to contain oil. An important aspect of integrated basin analysis is the relationship of oil generation and destruction to time and temperature. The purpose of this project is to establish and test these relationships. A major aspect of this project is to make the necessary modifications to our oil shale kinetic models so they will be appropriate for oil exploration. Another aspect of this project is to test our chemical kinetic models in geological settings. A necessary part of this is to adapt and apply techniques for determining thermal histories of sediments. A final issue is how to properly decouple chemical and physical processes in oil generation and transport, both in the laboratory and in a basin. We are really interested in when the oil reaches our trap, geological or laboratory. Our modeling of Green River oil shale demonstrated that the principal effect of pressure was to delay the distillation of oil from the material rather than change its rate of formation. If not properly separate, mass transport effects can cause erroneous chemical reaction rate parameters, thereby compromising the extrapolation to a geological time scale. Moreover, there is an exact parallel in the generation and expulsion of oil in a geological environment. The treatment of oil evaporation in our present oil shale pyrolysis model (PYROL) is not sufficiently general to rigorously treat either the geologic case or all laboratory experiments. Therefore, part of our effort is to develop the appropriate equation-of-state treatment that can calculate the amounts and compositions of the phases present in all environments. 7 figs., 2 tabs.

35651 **(UCID—21303-88-1) Petroleum geochemistry project: Quarterly report, January-March 1988.** Braun, R.L.; Burnham, A.K.; Sweeney, J.J. (Lawrence Livermore National Lab., CA (USA)). Apr 1988. Contract W-7405-ENG-48. 5p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88009861/JAW.

The objective of this work is to develop and test chemical kinetic models of oil generation and expulsion. The work has several components: experiments to understand the mechanisms and kinetics of oil generation, development of computer programs for analyzing experiments and applying chemical kinetics in a geological environment, and comparing predictions of chemical/geological models to field data. Some aspects of this work are part of a joint research project with INTEVEP, S.A., in which model predictions will be tested in the Maracaibo Basin. Other aspects are being done with partial support from an industrial sponsorship program that began this quarter. 1 tab.

35652 **(DOE/BC/10851—10) Dispersivity as an oil reservoir rock characterisic: Second annual report for the period October 1, 1986-September 31, 1987.** Menzie, D.E.; Dutta, S. (Oklahoma Univ., Norman (USA)). Apr 1988. Contract AC19-85BC10851. 42p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88001224/JAW.

A standard technique for determining the dispersion coefficient and dispersivity has been developed in this study. By using the dispersion measurement techniques as described in this paper, the extent of unsteady mixing of a resident fluid with the injected fluid in an oil reservoir rock can be determined. Dispersivities of several Berea sandstone cores were experimentally determined and attempts were made to correlate dispersivity and dispersion characteristics with other rock characteristics. The most significant and direct relationship of the dispersion characteristics was found to exist between the dispersion coefficient and the total permeability of a core. A correlation has also been developed to correct the viscosity effect of the displacing and the displaced fluid on the dispersivity of a reservoir rock. Average grain diameters of several Berea cores were determined by sieve analysis and correlated with the dispersion coefficients and dispersivities of the corresponding core samples. The dispersion coefficients and dispersivities of the Berea sandstone cores were found to increase with the increasing grain size. 15 refs., 9 figs., 4 tabs.

35653 **(DOE/LC/11075—2554) Development of a reservoir simulator for thermal recovery of heavy oils/tar sands in the presence of gas hydrates: Annual report.** Kamath, V.A.; Godbole, S.P. (Alaska Univ., Fairbanks (USA). Petroleum Development Lab.). Sep 1987. Contract FG21-86LC11075. 249p. NTIS, PC A11/MF A01;1; GPO Dep. Order Number DE88001056/JAW.

This report provides the summary of work performed under the US Department of Energy, Grant #DE-FG21-86LC11075, during the past year. The report contains detailed equations, numerical solution approach for the three models, namely: fundamental hydrate dissociation model, model for layered hydrate-oil configuration, and model for distributed hydrate-oil configuration. The results of the fundamental hydrate dissociation model are provided and discussed. The other two models have been formulated and computer coded. The results of these two models will be provided in the final report.

35654 **(DOE/OGT—88/1) Advanced oil and gas recovery technologies: A current awareness bulletin.** Tamura, A.T. (ed.). (USDOE Office of Scientific and Technical Information, Oak Ridge, TN). Jan 1988. 18p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88007992/JAW.

Current worldwide information available on enhanced petroleum recovery, unconventional gas, and oil shales and tar sands is presented on a monthly basis. This publication contains abstracts of DOE reports, journal articles, conference papers, patents, theses and monographs added to the Energy Data Base (EDB) during the past month. Also included are US information obtained through acquisition programs on interagency agreements and international information obtained through the International Energy Agency's Energy Technology Data Exchange or government-to-government agreements.

35655 **(GAO/RCED—86-5) Offshore oil and gas: Inspection of outer continental shelf facilities.** (General Accounting Office, Washington, DC (USA)). 1986. 43p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

During FY 1983 the Minerals Management Service generally met its requirement to conduct scheduled annual inspections of Outer Continental Shelf facilities; however, the Coast Guard did not. Further, MMS performed some periodic unannounced inspections. MMS and the Coast Guard found few violations per facility. Although reinspection of a facility would provide added assurance that violations had been corrected, both agencies usually did not perform separate reinspections of production facilities. Drilling facilities, however, are more prone to accidents and were generally reinspected. MMS inspection frequency and scope varied because of differing regional inspection strategies and staffing. The Coast Guard did not inspect all production facilities because it did not have enough resources, particularly helicopter transportation.

35656 **(NIPER—303) Optimal rheological characteristics in dynamic stability of polymer flow through porous media: Topical report.** Gao, H.W.; French, T.R. (National Inst. for Petroleum and Energy Research, Bartlesville, OK (USA)). Apr 1988. Contract FC22-83FE60149. 28p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88001225/JAW.

To identify the optimal rheological characteristics for maintaining the dynamic stability of polymer solutions flowing through porous media, displacement tests with a Newtonian fluid and a non-Newtonian fluid were performed in a 4-ft Berea sandstone core. A solution of 63 wt pct gylcerin in 53 meq/1 NaCL and a solution of 1500 ppM Pusher 500 in 53 meq/1 NaCl were used as the Newtonian fluid and non-Newtonian fluid, respectively. Two flow rates one in the purely viscous regime and one in the viscoelastic flow regime of Pusher 500 in Berea sandstone, were used in the displacement tests. The effluents collected were analyzed to determine polymer and tracer concentrations. The viscosities of the effluents were also measured with a Contraves viscometer. By comparing the concentration profiles obtained in tests with Pusher 500 and in those with gylcerin, the effects of flow rate, mobility ratio, and rheological characteristics on the dynamic stability of polymer flow in porous media were determined. At both leading and trailing edges of the polymer slug, stability increases with decreasing mobility ratio. At both high and low flow rates, a Newtonian fluid gives a more stable displacement at the fluid front than does a non-Newtonian fluid. Measurements on the mixing lengths at the back edge show that the size of the mobility buffer bank required for a flow rate at reservior conditions (viscous flow regime) would be less for a Newtonian fluid than for a non-Newtonian fluid. At a flow rate in the viscoelastic flow regime, the required size of the mobility buffer bank is less for a non-Newtonian fluid than for a Newtonian fluid. 39 refs., 13 figs., 1 tab.

35657 **(NP—8770216) Simulation model of surfactant retention. Final report.** Heinemann, Z.; Vicanek, J. (Preussag A.G. Erdoel und Erdgas, Hannover (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). 1986. 237p. (In German). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88770216/JAW.

The ultimate oil recovery can be improved substantially by injection of proper chemicals into the oil reservoir. The most promising results were obtained using surfactants able to reduce the oil-water interfacial tension. One of the main problems causing extremely high production costs is the surfactant retention in the oil-bearing formation. Better understanding of the oil production mechanism is necessary for planning of field projects as well as for optimization of the production economics. For this reason, a numerical model was developed to simulate the fluid flow in the oil reservoir during the surfactant flooding. The computer program takes into account the phase behaviour in the crude-salt-water-surfactant system and calculates the distribution of fluids and chemicals in the threedimensional porous medium. It enables to perform history-matching of the past performance, to predict the future oil production in the field and to provide information about the surfactant consumption during the field project life. With 186 refs., 8 tabs., 32 figs.

35658 **(PB—88-182357/XAB) Reliability and availability of computer-based process safety systems - a SINTEF project.** Bodsberg, L. (SINTEF, Trondheim (Norway)). 4 Dec 1987. 31p. (STF—75-A87038). NTIS, PC E04/MF E04.

The main activities within the SINTEF research project: Reliability and availability of computer-based process safety systems (PDS) are presented. The objective of the PDS project is to identify system configurations that ensure high production regularity and at the same time comply with safety regulations, and to develop analytical models and methods for reliability predictions of computer-based systems. Some examples of redundant configurations are presented and discussed. The emphasis is on hardware redundancy and self-test techniques. Experience concerning alarm and shutdown frequencies in offshore production is also presented. At the end of the report, an approach for the incorporation of operational experience into RAM models is given.

35659 **(PB—88-197389/XAB) Hydraulic-fracture circular-geometry model. Version 1. Topical report, July 1984-August 1987.** Hanson, M.E. (Comdisco Resources, Inc., San Francisco, CA (USA)). Feb 1988. 64p. NTIS, PC A04/MF A01.

A circular hydraulic fracture model was developed for the evolution of circular hydraulic fracture. The confined geometry allowed the use of closed-form integral equations for defining fracturing in elastic media. The Barenblatt condition was used to define the unwetted length ahead of the wetted portion of the fracture. Formulations defining fluid flow in the fracture incorporate both fluid and fracture compressibility. Local fluid flux is defined using a Poiseulle relationship. Leakoff is defined by applying one-dimensional, single-phase Darcy flow. This relationship allows calculation of the change in pore pressure around the fracture due to the leaking fluid. The confined circular geometry implies fracture propagation in a uniform modulus medium under a uniform confining stress. The model allows use of either a defined-inlet flow rate or a defined-inlet pressure.

35660 **(RISO-M—2653) Simulation of end effects in relative permeability experiments.** Ladekarl Thomsen, K. (Risoe National Lab., Roskilde (Denmark)). Jun 1987. 60p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752927/JAW.

The end effects in steady-state oil-water relative permeability measurements for a sand pack have been investigated by simulation. The exit length, which is due to capillary retention of the water, is shown to increase with decreasing flow rate and water-oil ratio (WOR). On the contrary, the entrance length increases for increasing flow rate and WOR. Thus it is important to ensure as uniform an inlet flow distribution as possible. If the two fluids are introduced via a common inlet chamber, it is necessary to assume either fingering flow, which may occur at high flow rate and WOR, or pulsating flow, which occurs at low rate and WOR. Stirring is an efficient means to reduce the entrance length. The use of a high-permeability dispersing inlet section is another method, which is also investigated.

35661 **(RISO-M—2686) COSI - Predictions and assessment of numerical performance.** Bech, N. (Risoe National Lab., Roskilde (Denmark)). Dec 1987. 41p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752933/JAW.

The basic reservoir simulation model, COSI, is a fully compositional isothermal double-permeability model. It is capable of handling hybrid grids as well as irregular grid cells. The simulator contains a black-oil option. The performance of the simulator has been studied in the fully compositional or multi-component equation-of-state mode. It is concluded that the results are reasonable. Calculations indicate that combustion gas injection could be an attractive enhanced oil recovery method for use in the Danish North Sea.

35662 **(RISO-M—2687) Investigation of the performance of various computers using COSI.** Bech, N. (Risoe National Lab., Roskilde (Denmark)). Dec 1987. 17p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752934/JAW.

The basic reservoir simulation model, COSI, is a fully compositional isothermal double permeability model. The simulator has been used to investigate the performance of different computer systems while solving typical oil reservoir simulation problems.

35663 **(AD-A—190120/6/XAB) Turbine fuels from tar-sands bitumen and heavy oil. Volume 2. Phase 3. Process design specifications for a turbine-fuel refinery charging San Ardo heavy crude oil. Final report, 1 June 1985-31 March 1987.** Talbot, A.F.; Swesey, J.R.; Magill, L.G. (Sun Refining and Marketing Co., Marcus Hook, PA (USA)). Sep 1987. 247p. NTIS, PC A11/MF A01.

An engineering design was developed for a 50,000-BPSD grass-roots refinery to produce aviation turbine fuel grades JP-4 and JP-8 from San Ardo heavy crude oil. The design was based on the pilot-plant studies described in Phase III - Volume I of this report. The detailed plant design described in this report was used to determine estimated production costs.

35664 **(AD-A—190145/3/XAB) New method of measuring multigrade oil-shear elasticity and viscosity at high shear rates.** Lodge, A.S. (Wisconsin Univ., Madison (USA). Dept. of Engineering Mechanics). 1987. 20p. NTIS, PC A03/MF A01.

Recent journal-bearing oil-film thickness data (1) strongly suggest that, in order to develop minimum-viscosity multigrade oils for maximizing fuel economy, it is not enough to examine viscosity n alone, it is essential also to examine a certain kind of shear elasticity, of which one measure is the first normal stress difference N1 in shear flow. Within a group of isoviscous multigrade oils, N1 values can differ significantly; for 10W-40 and 15W-40 oils, an average of 75% of the minimum oil-film thickness can be attributed to N1.

35665 **(AD-A—190640/3/XAB) Effect of weathering on octane quality for winter-grade and summer-grade gasolines. Final report.** Wares, R.N. (National Inst. for Petroleum and Energy Research, Bartlesville, OK (USA)). Dec 1987. 84p. NTIS, PC A05/MF A01.

Weathering tests were conducted to examine the effects on fuel volatility and octane characteristics. The commercially available gasolines utilized in the study represented a wide geographic distribution for both winter and summer fuels. Aging was accomplished by heating the fuel samples to 110°F and maintaining that temperature for 48 hours. Time histories of Reid Vapor Pressure (RFP) were conducted. Fuel octane evaluations, both MON and RON, were done. Component characterization by gas chromatography were made to identify components lost during the aging process. The time histories of vapor-pressure changes depended to a limited measure on the initial fuel vapor pressure as well as to differences in composition. Butanes and isopentanes were the primary constituents lost due to the weathering. For the most, part octane changes due to fuel weathering were minimal.

35666 **(IEE-SR—194) Survey on development of intra-trade physical distribution of petroleum products.** Tanaka, Norio; Okaya, Yukio. (Institute of Energy Economics, Tokyo (Japan)). 15 Aug 1987. 46p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88770184/JAW.

This survey is by contract with the Agency of Natural Resources and Energies of MITI. In the structural reshaping of the petroleum industry, such physical rationalization as utilization of common terminal and exclusion of complex transportation is regarded necessary. This survey is a basic information for building up a consensus of the petroleum industry by examining the most suitable distribution system by clarifying the actual status and features of distribution of rationalization. The contents examined for the third year of the 3-year plan are as follows. Comprehensive reviewing of physical distribution of the subjects to be rationalized. Status of information disposal of physical distribution business of primary oil suppliers. Future direction of information disposal of physical distribution. (12 figs, 16 tabs)

35667 **(PB—88-184205/XAB) Initial calculation of range and mission fuel during conceptual design.** Torenbeek, E. (Technische Hogeschool Delft (Netherlands). Dept. of Aerospace Engineering). Aug 1987. 29p. (LR—525). NTIS, PC E03/MF A01.

Derivations are presented for the range of aircraft with gas-turbine propulsion systems, which cannot be characterized to have either constant specific fuel consumption or constant propulsive efficiency. The effects of different cruise techniques are investigated. It is found that, for preliminary design purposes, a very simple approximation of the fuel fraction can be used for all aircraft categories and various cruise techniques. This result used to compute the total mission and reserve fuel.

35668 (CONF-8804108—2) A laboratory scale liquid/solid smoke generator to simulate the XM55 field system. Moneyhun, J.H.; Gayle, T.M.; Jenkins, R.A. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OT21400. 12p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009711/JAW.

From 12. symposium on smoke/obscurants; Laurel, MD, USA (19 Apr 1988).

In order to conduct toxicological studies of candidate materials for the XM55 wide area obscurant generator, a generator which simulates its performance on a laboratory scale was required. A system has been designed to generate aerosols from a petroleum based liquid and a finely dispersed solid and blend the two clouds together so as to provide an atmosphere for animal inhalation toxicology studies. The liquid aerosol is generated by an evaporation-condensation process, while the solid is dispersed using a jet mill system. Concentrations of each of the components may be controlled over a range from {minus}100 mgm^3 to several gm^3. Levels of the single component aerosols are determined by gravimetric analysis of filter samples. The levels of each component of the mixed aerosols are determined by filtration, followed by uv absorption analysis of the liquid component. Particle size as determined by cascade impaction was {minus}1 micron mass median diameter for the mixed aerosols at a concentration of 1 gm^3 of each component. Mass median diameters for three individual aerosol components are {minus}0.5 and {minus}2.5 microns for the liquid droplets and solids, respectively. Significant losses of the solids to surfaces within the system have been observed, probably due to electrostatic charging of the particles. Analysis of the liquid fraction of the mixed aerosol by uv absorption indicates an increase in molar absorptivity at 255 nm, suggesting a partial chemical transformation of the liquid during aerosol generation. 6 refs., 3 figs., 4 tabs.

35669 (EMR—1987) Working the offshore safely. (Department of Energy, Mines and Resources, Ottawa, Ontario (Canada)). 1987. 36p. (In English and French). (MICROLOG—88-01281). Energy, Mines and Resources Canada, 215 Water Street, Ste. 301, St. John's, Nfld., Canada A1C 6C9; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This document begins with a review of Canadian offshore operations in oil and gas development since the sixties, and the role of government policy in these operations. The importance of safety in the offshore is the main topic, and discussion starts with mentioning industry-government cooperation in increasing safety factors. More specific discussion is presented on evacuation of drilling rigs, survival in the water, safety training, search and rescue operations, and the potential of satellite technology. 12 figs.

0207 Marketing And Economics

REFER ALSO TO CITATION(S) 35666, 35697

35670 (APMC—1986) Alberta Petroleum Marketing Commission annual report, 1986. (Alberta Petroleum Marketing Commission, Calgary (Canada)). 1986. 33p. (MICROLOG—88-01261). Alberta Petroleum Marketing Commission, 1900-250 6th Ave. S.W., Calgary, Alta., Canada T2P 3H7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Alberta Petroleum Marketing Commission has responsibility for selling the Crown's royalty share of Alberta's crude and synthetic oil production. It also markets crude oil on behalf of over 200 producers to North American and offshore consumers. The Commission's position as the largest crude oil marketer in Canada enables it to provide analysis of industry pricing and marketing trends to the Alberta government. In addition to crude oil activities, the Commission also provides similar services in natural gas including price regulation duties and incentive plans. This report summarizes the year's activities of the Commission and includes financial statements.

35671 (CONF-880723—1) Estimating the macroeconomic effects of world oil price projections by the US Department of Energy. Teotia, A.P.S.; Poyer, D. (Argonne National Lab., IL (USA)). 27 May 1988. Contract W-31-109-ENG-38. 17p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011956/JAW.

From 10. annual international conference of the International Association for Energy Economics; Luxembourg, Luxembourg (4 Jul 1988).

In an environment of falling crude oil prices, the US crude oil imports reversed their decline in 1986. After hitting bottom at about 22% share of total crude oil supplies, the imported crude oil share rose to 29% in 1986 and 32% in 1987. This paper indicates that dependence on insecure foreign oil supplies is expected to grow. In the absence of any strong policy actions, the crude oil import share is projected to be in the range of 40-45% by 1995. This could have serious implications for the stable economic growth and energy security of the country. As a result, some prudent government and industry policy actions are needed to reduce the dependence on foreign crude oil before it becomes a critical problem.

35672 (DOE/EI/19926—T1) Michigan residential heating oil survey: Final report, Winter 1986-1987. Childers, G.H. Jr. (Michigan Public Service Commission, Lansing (USA)). 29 May 1987. Contract FC01-86EI19926. 24p. NTIS, PC A03;3. Order Number DE88010796/JAW.

This report summarizes information on home heating oil prices and inventories over the 1986/87 heating season in Michigan. From October through May, participating dealers/distributors were polled for their current residential (retail) and wholesale prices of No. 2 home heating oil. Primary stock (inventory) data was also collected from select bulk terminals and refineries from October through March. This information was transmitted to the US Department of Energy (DOE), Energy Information Administration, biweekly (weekly during December through February) using an electronic mail system. Michigan's participation in this program started in 1979. In addition to assisting the Energy Information Administration meet its Congressional mandate of providing an accurate and timely energy profile nationwide, the state has made valuable use of the price information by establishing its own data base using week-current figures.

35673 (DOE/EI/19930—T1) State heating oil program: Final report, September 1986-June 1987. (New York Energy Office, Albany (USA)). 29 May 1987. Contract FC01-86EI19930. 10p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010177/JAW.

The New York State average weighted price of home heating oil during the reporting period had a steady price increase compared to the previous year which had shown a major price decline. The wholesale-residential price margins remained relatively stable in New York during the 1986-87 season averaging about 35 cents per gallon. Inventory levels in primary storage were higher than the previous year but maintained the pattern of the previous year. The peak levels appeared in the mid-winter season.

35674 (DOE/EI/19931—T1) EIA(Energy Information Administration)/State No. 2 heating oil monitoring program, Minnesota: Final report, Winter 1986-87. (Minnesota Dept. of Energy and Economic Development, St. Paul (USA). Energy Div.). May 1987. Contract FC01-86EI19931. 24p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010178/JAW.

This paper represents the final report of the Minnesota Department of Energy and Economic Development (DEED) to the Energy Information Administration (EIA), U.S. Department of Energy regarding the EIA/State No.2 Fuel Oil Monitoring Program for winter 1986-87. Prices and stocks of No.2 Fuel oil were monitored by DEED during the course of the heating season and results were sent electronically to EIA immediatley after each survey. In addition, DEED used this project to watch for any

sharp increase in heating oil prices or tightness of supplies following an oil pipeline break in Fall 1986 that disrupted supplies for northeastern Minnesota. This report presents the sampling methods, survey procedures, analysis and results of the monitoring program in Minnesota.

35675 (DOE/EI/19933—T1) State of Connecticut Middle Distillate Monitoring Program for the period July 1986-June 1987: [Final report]. (Connecticut Office of Policy and Management, Hartford (USA). Energy Div.). Jun 1987. Contract FC01-86EI19933. 31p. NTIS, PC A03;3. Order Number DE88010807/JAW.

Heating oil prices both retail and wholesale and stock levels are presented for the state of Connecticut for the period October 1, 1986 through May 4, 1987. (AT)

35676 (DOE/EI/19934—T1) Winter distillate survey, 1986-1987. (Rhode Island Dept. of Administration, Providence (USA). Div. of Planning). 29 May 1987. Contract FC01-86EI19934. 8p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008140/JAW.

The State of Rhode Island, implemented a program to monitor prices and inventory levels of {number←sign}2 heating oil during the period October 6, 1986 to May 4, 1987. The residential and wholesale prices were collected from the same list of companies used in the 1985 to 1986 heating season. One retail seller went out of business during the year, bringing the number for which only retail prices were obtained to thirteen. Four dealers provided both retail and wholesale prices. Wholesale prices were obtained from seven sources. Thus twenty four contacts were made each week or bi-weekly, according to the schedule established by DOE, to provide the price information from the state. Distillate stocks within the state were ascertained as per the required schedule from nine sources, representing the majority of stocks. In one case, two terminals are involved and the amounts added. All data received was compiled and transmitted to DOE on time utilizing Dialcom electronic mail. 3 tabs.

35677 (DOE/EIA—0109(88/02)) Petroleum supply monthly, February 1988. (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). 25 Apr 1988. 100p. NTIS, PC A06/MF A01 - GPO;1; GPO Dep. Order Number DE88009298/JAW.

Total US demand for petroleum products during February 1988 averaged about 17.6 million barrels per day, 0.9 million barrels per day above the average of a year earlier. This marks the third consecutive month in which total product supplied has exceeded 17.0 million barrels per day. For the most part, the disposition of the major products continued to follow seasonal patterns. Total products stocks dropped by 26.0 million barrels to 683.1 million barrels. Refinery utilization fell from January's 82.8 percent rate to 81.1 percent. Crude oil imports from Saudi Arabia rose to 1.2 million barrels per day, 0.4 million barrels per day above the average for January. Unusually mild weather, especially in the Mid-Atlantic states and New England, kept deliveries of both distillate and residual fuel oil virtually unchanged from January's high seasonal levels, although both were still well above the levels for these products the same time last year. Distillate demand averaged 3.5 million barrels per day in February, five percent above the February 1987 average. Residual fuel oil demand was 1.6 million barrels per day this month, nine percent greater than a year ago. Part of this increase in demand from the previous year reflects the improved competitive position of residual fuel oil in some utility and industrial markets, mostly due to increases in natural gas prices starting in the fourth quarter of 1987. 12 figs.

35678 (DOE/EIA—0109(88/03)) Petroleum supply monthly, March 1988. (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). 27 May 1988. 118p. NTIS, PC A06 - GPO;3. Order Number DE88011233/JAW.

Total US demand for petroleum products during March 1988 averaged 17.5 million barrels per day, about the same as in February. This is, however, 1.6 million barrels per day above the level of a year earlier. Seasonal drops in residual fuel oil and propane demand were partially offset by a rise in motor gasoline consumption. A scheduled change in tax laws affecting certain purchasers of diesel fuel kept deliveries of distillates at the same high level as in February and brought distillate stocks at the primary level to their lowest level since 1967. Other March highlights include the following: total product stocks fell 23.2 million barrels, primarily because of a big drawdown in distillate stocks; and refinery utilization increased in March to 83.5 percent. 12 figs., 33 tabs.

35679 (DOE/EIA—0208(88-25)) Weekly petroleum status report: Data for week ended, June 10, 1988. (USDOE Energy Information Administration, Washington, DC). 15 Jun 1988. 33p. NTIS, PC A03/MF A01 - GPO;1; GPO Dep. Order Number DE88011559/JAW.

The Weekly Petroleum Status Report (WPSR) provides timely information on the petroleum supply situation in the context of historical information, selected prices, and forecasts. The WPSR is intended to provide up-to-date information to the industry, the press, planners, policymakers, consumers, analysts, and State and local governments. It is published each Thursday by the Energy Information Administration (EIA). The data contained in this report are based on company submissions for the week ending 7 a.m. the preceding Friday. Contents include: refinery activity; stocks; imports; petroleum products supplied; prices; weather summary; natural gas in underground storage; weekly estimates; and appendixes. 11 figs., 16 tabs.

35680 (DOE/EIA—0380(88/01)) Petroleum marketing monthly, January 1988. (USDOE Energy Information Administration, Washington, DC. Office of Oil and Gas). 5 Apr 1988. 183p. NTIS, PC A08 - GPO;3. Order Number DE88007995/JAW.

The Petroleum Marketing Monthly (PMM) is designed to give information and statistical data about a variety of crude oils and refined petroleum products. The publication provides statistics on crude oil costs and refined petroleum products sales for use by industry, government, private sector analysts, education institutions, and consumers. Data on crude oil include the domestic first purchase price, the f.o.b. and landed cost of imported crude oil, and the refiners' acquisition cost of crude oil. Sales data for motor gasoline, distillates, residuals, aviation fuels, kerosene, and propane are presented. Monthly statistics on purchases of crude oil and sales of petroleum products are presented in five sections. These are the summary of crude oil and petroleum products, crude oil prices, sales prices of petroleum products, sales volumes of petroleum products, and first sale of petroleum products for consumption. 12 figs., 53 tabs.

35681 (GAO/RCED—87-98) Mineral resources: Timely processing can increase rent revenue from certain oil/gas leases. (General Accounting Office, Washington, DC (USA)). 1987. 18p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

Federal regulations require that onshore oil and gas leases that are subsequently determined to overlie a known geologic structure are to have their rental rates increased. The Bureau of Land Management does not have internal controls that ensure that such rental increases are processed consistently and in a timely manner. Although BLM'S state offices in Colorado and Wyoming generally increased rental rates for leases determined to overlie known geologic structures, these increases were not made in a timely manner during calendar years 1984 and 1985. These delays resulted in lost revenue of $552,614. There were also a few instances in the two states in which the rental rates had not been increased at all, causing an additional revenue loss of at least $15,123.

35682 (GAO/RCED—87-180BR) Gasoline marketing: Octane mislabeling in New York City. (General Accounting Office, Washington, DC (USA)). 1987. 16p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The problem of octane mislabeling at gasoline stations in New York City has grown - from 46 or fewer citations in 1981 to 171 citations in 1986. No single source of octane mislabeling exists but the city has found both gasoline station operators and fuel distributors to blame. The problem does not seem to be unique to any one type of gasoline station but 57 percent of the 171 citations

issued involved gasoline sold under the name of a major refiner; the rest involved unbranded gasoline. Octane cheating can be lucrative in New York City. A station intentionally mislabeling its gasoline could realize amounts many times the city's maximum $500 fine for cheating.

35683 **(IEE-SR—190) Study on changes in oil supply structure in the world.** (Institute of Energy Economics, Tokyo (Japan)). 20 Sep 1987. 258p. (In Japanese). NTIS (US Sales Only), PC A12. Order Number DE88752533/JAW.

This report presents results of a study on changes in the oil supply structure in the world. The oil trade (total exports) in the free world in 1986 was 24,060,000 barrels/d, of which 83.9 percent and 16.1 percent were accounted for by raw oil and products, respectively. For raw oil, about 50 percent of the total exports was traded with its price set on the agreement basis, 26 percent on the netback price basis (mainly in the Middle East), and other portions on the spot price linkage basis and fixed-price construct basis. Equity oil traded by companies with oil interests and counter trade oil are responsible for 10 percent and 8 percent, respectively, of the total exports. Most of the exported oil is traded on some form of of agreement-based price system while spot oil accounts for only 14 percent of the total exports. OPEC and non-OPEC countries account for 66 percent and 34 percent, respectively, of the total exports. More than one-third of the OPEC oil is traded on the netback price basis. For non-OPEC countries, spot oil is responsible for 29 percent, most of which is accounted for by the Northern Sea oil. Concerning the regional classification, the Middle East is responsible for 42 percent, followed by Europe, Africa, Central/South America and Asia. (18 figs, 18 tabs)

35684 **(LBL—21186) Mexican oil balance and opportunities for conservation.** Ketoff, A.; Schiorring, E. (Lawrence Berkeley Lab., CA (USA)). Jun 1986. Contract AC03-76SF00098. 21p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008415/JAW.

Mexico's abundant oil reserves spurred the development of a highly oil-intensive domestic economy. While oil demand continues to grow despite the recession of the last four years, the recent drop in oil prices -- and therefore in export revenues -- is limiting the country's capacity to invest in new exploration. At the same time, the country's need to generate foreign exchange to pay its debt service may force an escalation in oil exports. A conflict is emerging between Mexico's need to satisfy the domestic demand for oil and its need to export oil to service the debt. In this context, an oil conservation policy appears to be the only viable alternative, although its potential will be limited by lack of capital. The sectoral analysis presented in this report identifies unexplored opportunities for energy conservation and points to the forces that will drive future patterns of demand. 18 refs., 1 fig., 8 tabs.

35685 **(NP—8752879) Oil report 1986.** (Oliebranchens Faellesrepraesentation, Copenhagen (Denmark); Oliebranchens Faellesrepraesentation, Copenhagen (Denmark)). 1987. 39p. (In Danish). Risoe Library, DK-4000 Roskilde, Denmark.

Published yearly.

A brief description is given of the international petroleum situtaion, and a survey is made of the Danish petroleum supply and of the petroleum industry in relation to e.g. new Danish governmental regulations, and the energy debate. Statistics are given of Denmarks petroleum consumption, forecasting of Danish energy consumption, the World's petroleum production, and the trend of the petroleum prices.

35686 **(GAO/RCED—87-118) Water pollution: EPA controls over ballast water at Trans-Alaska Pipeline Marine Terminal.** (General Accounting Office, Washington, DC (USA)). 1987. 42p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The Alyeska Pipeline Service Company at Valdez, Alaska, operates a water treatment plant at the terminal to treat ballast water, oily sea water that is carried in tankers to provide stability, before it is discharged into the bay. The Environmental Protection Agency is nearly 4 years late in issuing a new permit to Alyeska which regulates the types and amounts of pollution that can be discharged. Alyeska has been operating under an extension of its old permit whose conditions may be less stringent than the new permit will require. Prior to 1984, EPA monitored Alyeska's permit and identified instances of noncompliance with permit conditions, but its enforcement actions were limited to discussions and correspondence with Alyeska. In contrast, since 1984, EPA has begun taking enforcement actions as well as investigating allegations of other environmental problems. EPA should have acted sooner and until the new permit is issued, questions about the protection of marine life and water quality in Valdez Bay will remain unanswered.

35687 **(KTM/E-D—141) Flue gas desulphurization by means of improved limestone injection applied to oil firing.** Haemaelae, S.; Kenakkala, T.; Laine, J.; Mattila, K.; Vaelimaeki, E. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). Sep 1984. 56p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752878/JAW.

Tightening of air protection regulations all over the world makes demands also on the availability of the SO_2 removal plant while the operating conditions in the power plant and the sulphur content of the fuel vary. In this project applying the new Lifac desulphurization process developed by Tampella to oil firing was examined at the testing unit built in the combustion laboratory of Neste Osakeyhtioe in Kulloo, where the absorbing power of calcium is improved by increasing the humidity of the flue gases. The research results indicate that this method can also be utilized at oil firing if sootblowing on the heat surfaces of the oil-fired oiler is regularly perfomed. The results also indicate that applying this process it is easy to reach the emission level of 230 mg SO_2MJ i.e. 710 mg SO_2Nm"3, which conforms to the regulations set to the new incinerators with a fuel capacity of less than 150 MW. By making the automatic control of the process more effective, the emission level of 140 mg SO_2MJ i.e. 430 mg SO_2Nm"3, which is the regulation set to the new incinerators with a capacity of more than 150 MW, is also reachable in continuous operation. The variation in the sulphur content of the oil does not restrict the availability of the process and so it also suits well for fuel with high sulphur content. When the price level of the year 1986 is applied, the total costs for desulphurization are 4 FIMMWh to 6 FIMMWh calculated for a plant firing 150 MW/sub th/ oil.

35688 **(NP—8770217) Specific emissions from a waste oil refinery.** Wentrup, G.J. (Umweltbundesamt, Berlin (Germany, F.R.)). Oct 1986. 451p. (In German). NTIS (US Sales Only), PC A20. Order Number DE88770217/JAW.

In the introduction the waste oil problem is considered and it's given a review of the level of technology for waste oil refining process. Characteristic data (e.g. density, content of water, sulfur, chlorine, chlorinated hydrocarbon, aromatic hydrocarbon) of several waste oil samples with different quality were analyzed and summarized in tables. Especially the concentration of polychlorinated biphenyls (PCB) in input-, intermediate- and output-products of the refining process were investigated. Problems in PCB-analysis of waste oil were pointed out. Specific emissions of components of environmental interest, expressed in gram per ton waste oil, were determined for storage- and product-tanks, processing units and waste-water purification plant. Additionally the influence on the specific emissions of newer refining process technologies as well as steps to decrease emission was investigated. With 219 refs., 215 tabs., 37 diagrams, 31 figs..

35689 (PB—88-182472/XAB) Oil-spill combat in the Arctic - an alternative approach. Sveum, P. (SINTEF, Trondheim (Norway)). 29 Dec 1987. 27p. (STF—21-A87106). NTIS, PC E04/MF E04.

The main objective of the paper is to evaluate the feasibility of establishing a low-cost oil-spill strategy. This includes an evaluation of certain principles when an accidental oil spill occurs. The risk connected with the particular type of strategy should not be greater than employing conventional strategies and, if any alternative countermeasures are involved, the countermeasure should not involve more risk than the oil represents.

35690 (PB—88-183280/XAB) Treatment of oil and oily wastes. Halmoe, G. (SINTEF, Trondheim (Norway)). 8 Dec 1987. 33p. (STF—21-A87117). NTIS, PC E04/MF E04.

This paper gives a brief summary of the available methods for the treatment of oily wastes, the possibilities of each method, and their limitations. These evaluations are mainly based on the experience gained at SINTEF from disposal studies. The evaluations are closely related to Norwegian conditions, particularly with regard to shoreline types, accessibility for clean-up, and limited possibilities for incineration or recovery. Some examples are also given in the form of short summaries of the main experiments that have been carried out by SINTEF. These include laboratory-scale, model studies and full-scale experiments. For complete descriptions of the experimental parameters and results, references are given to the original reports.

35691 (Y/DZ—392) Treatability studies for waters in oil pond No. 1, oil pond No. 2, and the oil seep. Napier, J.M.; Hancher, C.W.; Harris, G.E.; Johnson, M.E.; Padgett, B.C. (Oak Ridge Y-12 Plant, TN (USA)). 3 May 1988. Contract AC05-84OS21400. 36p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011587/JAW.

Laboratory and pilot plant studies have investigated treatment methods for water contained in 2 small ponds located at the Bear Creek burial grounds. The sediments in the bottom of the pond are contaminated with polychlorinated biphenyls (PCB) and plans to close out these ponds and remove the sediments have been prepared. These laboratory and pilot plant studies show that the water in the ponds contained no significant amounts of metals and only trace quantities of organics. The amount of PCB in the water was near the detection level. The biological quality of the water before treatment was excellent. Unit operations examined in these studies included filtration, air stripping and carbon filtration. Air stripping removed all of the trace amounts of volatile organics and carbon filtration removed all of the detectable quantities of other organics except for the low amounts of total organic carbon. Based on these tests it has been recommended that the water in the ponds be filtered and released without additional treatment through a permitted discharge point. Water from any oil seep is recommended to be collected and treated using filtration, air stripping and carbon filtration. Any water released from this process should meet the permitted discharge quality plus meet a biological test specified by the permitting agency. 2 figs., 16 tabs.

35692 The biological effects of petroleum hydrocarbons in the sea: Assessments from the field and microcosms. Spies, R.B. (Environmental Sciences Div., Lawrence Livermore National Lab., P.O. Box 5507, L453, Livermore, CA 94550 (US)). pp 411-468 of Long-term environmental effects of offshore oil and gas development. Boesch, D.F.; Rabalais, N.N. New York, NY; Elsevier Science Pub. Co. Inc. (1987).

Given our meager understanding of how marine ecosystems function and the causes of their variability, the question of whether chronic low-level petroleum contamination poses a serious threat to life in the sea is a particularly difficult one to answer completely. To the extent which we do not understand why things change in ecosystems, our answer will be incomplete-a situation which engenders various degrees of concern and motivates further research. Realizing out limitations and the variable circumstances of petroleum contamination, the aim of this review is to evaluate the results of field and microcosm studies and the extent these results allow us to predict the outcome of continued and expanded offshore petroleum extraction, transportation and related sources of contamination. Emphasis will be placed on sublittoral studies for which 1) there are extensive biological and chemical analyses, 2) effects have been suggested at very low concentrations, 3) no effects have been claimed in areas of extensive contamination, or 4) insights into critical processes or effects are evident.

35693 (CMG—1201) The development of a general phase envelope construction algorithm for reservoir fluid studies. Li, Y.K.; Nghiem, L.X. (Computer Modelling Group Canada). Apr 1982. 58p. (CE—01442). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This report deals with the development of a general algorithm for phase envelope constructon. It extends the pressure-temperature diagram construction method of Michelsen (1980) to the generation of phase envelopes on pressure-composition, temperature-composition and composition-composition diagrams. The bubble point and dew point curves are traced in one pass, and an estimate of the critical point is also given. The loci of mixtures having a constant vapor-liquid split (e.g. 25% vapor mole fraction or volume fraction) can also be generated. The algorithm selects internally the primary variables and the points on the diagram to enhance the convergence. Results are presented for simple binary mixtures, typical reservoir oil-CO_2 mixtures and a gas condensate. Problems associated with a discontinuity in the phase envelope because of a three-phase region are also presented, and it is shown how an analysis of the Gibbs energy surface can help in discarding unrealistic results. 20 refs., 25 figs., 3 tabs.

35694 (EPRI-AP—5826-Vol.1) Residual fuel oil user's guidebook: Volume 1, Residual oil fudamentals: Final report. Sefer, N.R.; Moulton, D.S. (Southwest Research Inst., San Antonio, TX (USA)). May 1988. 203p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011425/JAW.

Residual fuels are, by their very definition, the lowest quality petroleum fuels available: the residue that is left over after all the higher grade fuel components are removed from the crude oil. As such, they are the cheapest fuels available and therefore attractive to industries which are large consumers of fuel, e.g., refinery processing, marine, and electric utilities. Boilers, gas turbines, and diesel engines have been successfully designed to operate efficiently on residual fuel with acceptable durability and within environmental constraints. Nevertheless, problems arise that are often attributable to some critical properties of residual fuels which may vary considerably. They result in added maintenance costs, and operational interruptions either in storage and handling, or in combustion. They are generally manageable, particularly if solutions can be found based upon experience. The combined utility industry experience with residual fuel has been communicated and documented for some years by means of EPRI-coordinated meetings of utility technical and management staff. These meetings have identified the need for a practical and updatable document to which utilities staff can refer for specific information in procurement and utilization of residual fuel. This Residual Oil Users' Guidebook is intended to serve that purpose. The guidebook has been organized into four distinct subject areas: Volume I Residual Oil Fundamenals; Volume II Residual Oil-Fired Boilers; Volume III Residual Oil-Fired Gas Turbines; and Volume IV Residual Oil-Fired Diesels. Volume I is essentially a textbook on residual oil, with topics ranging from re-

sidual oil production to physical and chemical properties. Also included in Volume I is a comprehensive bibliography covering the 1973--1985 time frame.

0240 Storage

35695 **(DOE/FE—0101/1) Strategic Petroleum Reserve: Quarterly report, [January 1, 1988-March 31, 1988].** (USDOE Assistant Secretary for Fossil Energy, Washington, DC. Office of Petroleum Reserves). 15 May 1988. 10p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88011220/JAW.

The May 15, 1988, Strategic Petroleum Reserve Quarterly Report describes activities undertaken with respect to the development of the Reserve during the period January 1, 1988 through March 31, 1988. The introduction and summary briefly discuss program background and major activities of this quarter. Section II describes site development. Oil acquisition activities are reported in Section III. Other program topics are discussed in Section IV. Information on the budget and cost of the Reserve is contained in Section V. During the second quarter of fiscal year 1988, Strategic Petroleum Reserve storage capacity reached 580 million barrels. At Big Hill, surface construction for the remaining 9 of a total of 14 storage caverns achieved a 93 percent completion status. At Bayou Choctaw, Cavern 101 development continued on schedule. At West Hackberry, leaching operations continue on schedule toward a September 1988 completion. The total inventory of crude oil stored in the Strategic Petroleum Reserve reached 544,937,994 barrels during the quarter ending March 31, 1988. The average fill rate during the quarter was 47,140 barrels per day, and the weighted average delivered price during this quarter was $15.53 per barrel. The average fill rate for the first half of fiscal year 1988 was 60,374 barrels per day. Funds available for obligation in fiscal year 1988 include $439 million in the SPR Petroleum Account for the acquisition and transportation of crude oil and $232 million in the Strategic Petroleum Reserve Account for activities associated with storage facilities development and the operation and management of the Strategic Petroleum Reserve. 2 tabs.

35696 **(EPRI-CS—5780) Monitoring technologies for underground storage tanks: Final report.** (Weston (Roy F.), Inc., Concord, CA (USA)). Apr 1988. 137p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009904/JAW.

This five chapter report provides an introduction to available technologies for monitoring underground storage tanks (UST) for leakage. Proposed federal regulations, as well as many existing state and local laws, require UST owners and operators to install devices to enable the detection of UST releases and minimize the potential for environmental damage. This report provides sufficient information to enable the reader to become familiar with the various approaches available for UST leak detection, and to understand and select an appropriate UST monitoring system for their specific situation. Three major approaches to UST leak detection are: tank tightness testing; in-tank monitoring systems, such as automatic tank gauging systems which monitor potential inventory losses; external tank monitoring systems, such as groundwater monitoring wells, soil-gas vapor monitoring and secondary containment barriers. 49 refs., 8 figs.

35697 **(GAO/RCED—87-204FS) Oil reserves: An analysis of costs - Past, present, and future.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 1987. 21p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

This fact sheet determines the total federal expenditures to date on the Strategic Petroleum Reserve per barrel of crude oil stored, with costs allocated among operations, construction, and oil; the estimated additional per-barrel expenditures of the federal government over the next 5, 10, and 15 years, allocated among the same cost categories and assuming no changes in existing federal policy on reserve levels; and in the event of an SPR drawdown, the amount any purchaser of crude oil from the SPR would pay per barrel under existing federal policy.

35698 **(EPRI-AP—5826-Vol.3) Residual fuel oil user's guidebook: Volume 3, Residual oil-fired gas turbines: Final report.** Moses, C.A.; Schwalb, J.A.; Winkler, M.F. (Southwest Research Inst., San Antonio, TX (USA)). May 1988. 104p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011426/JAW.

Volume three presents valuable information on using residual fuel oil of increasingly unpredictable quality in turbines to generate electric power. Contents include: gas turbine installation which covers components and design consideration for residual fuel; operating and maintenance procedures when using residual fuels; listing of residual fired gas turbine installations; and appendixes for code of Federal regulations and worldwide listing for residual fuel gas turbine installations. 51 refs., 20 figs., 5 tabs.

35699 **(EPRI-AP—5826-Vol.4) Residual fuel oil user's guidebook: Volume 4, Residual oil-fired diesels: Final report.** Bailey, B.K.; Winkler, M.F. (Southwest Research Inst., San Antonio, TX (USA)). May 1988. 175p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011427/JAW.

Volume four presents valuable information on using residual fuel oil of increasingly unpredictable quality in diesel engines. Contents include: residual fuel and diesel applications; fuel treatment and cleaning; engine types; engine fuel systems; operations; effects of residual oil on diesel maintenance; bottoming cycles and cogeneration; exhaust emissions; and appendix on installation listing-stationary plants utilizing residual fuels in diesel engines. 4 refs., 36 figs., 26 tabs. (New Mexico Inst. of Mining and Technology, Socorro (USA). New Mexico Petroleum Recovery Research Center). [1988]. Contract AC21-84MC21179. 18p. (PRRC—87-12). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88006473/JAW.

Summary of results obtained in the last quarter are presented for the following tasks: (1) advanced core analysis which covers pore structure by uv reflectance microscopy and clay analysis of MWX cores; (2) flow along and across fractures; (3) chemical alteration of various mineralogical components and resultant effects on permeability; and (4) effect of water on gas production. 9 refs., 4 figs., 2 tabs.

35702 **(PB—88-197397/XAB) Analysis of drill core from the Siljan Ring impact structure and related processes in shear-zone terranes. Annual report, October 1, 1986-September 30, 1987.** Valley, J.W.; Komor, S. (Wisconsin Univ., Madison (USA). Dept. of Geology and Geophysics). Nov 1987. 56p. NTIS, PC A04/MF A01.

Sampling was conducted at the Siljan Ring, Sweden, on the surface from inside and outside of the ring, from drill core in pilot holes, and from drill core and cuttings in the deep Gravberg hole. Petrographic, fluid inclusion, stable isotopic, and electron microprobe analyses are underway. Thus far, these studies have not detected volatiles other than H_2O in fluid inclusions from quartz in the granite. Methane, H_2 and H_2S minimum detection limits are 3 vol. % by laser Raman and 20 vol. % optically. Isotopic analysis of calcite crack cements in granite does not confirm the prediction of Gold (1985) that delta^{13}C values would progressively decrease with depth in the Gravberg well. Instead, the results support a model where carbon is carried downward into the granite by surface water to precipitate calcite. A correlation of low delta^{13}C (< -10) near the center of the crater and higher, but variable, delta^{13}C (-19.4 to +2.2) near the annulus exists in samples from pilot holes. This may be explained if carbon in groundwater represents mixing of two reservoirs: high delta^{13}C (approximately equals 0) from Paleozoic limestones in the annulus and low delta^{13}C (-10 to -20) from organic decay.

Annual technical report, February 1, 1987-January 31, 1988.** Graham, R.L.; Foster, J.; Walbe, K.; Worthington, J. (Graham (Reuben L.), Inc., Charleston, WV (USA)). Feb 1988. 74p. NTIS, PC A04/MF A01.

See also PB—87-215992; Color illustrations reproduced in black and white.

The ccoperative program is a continuing field-oriented effort whose objectives are to identify productive gas zones, to develop a comprehensive set of diagnostics, and to determine the effectiveness of various stimulation techniques. To date, the program has encompassed fifty cooperative wells and twelve participating producers, with outside funding in excess of 8 million dollars. The rapport established with these producers resulted in an evolution of the program from one of passive data acquisition to one of active participation. The report focuses on what was accomplished during this period regarding the development of diagnostic tools and evaluation techniques, the acquisition of producer participation and support, and the expansion of data acquisition and use of newly developed evaluation techniques. The report also addresses what has been learned and how this knowledge led to the course corrections in the study to achieve a more effective level of technology. The report illustrates the methods and technology developed and provides the recommended direction for future research.

35705 **(BNL—41068) Clean carbon fuel from methane and carbon dioxide.** Steinberg, M.; Grohse, E.W. (Brookhaven National Lab., Upton, NY (USA)). Mar 1988. Contract AC02-76CH00016. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012134/JAW.

Natural gas, which contains mostly methane, is generally largely available from wells in many parts of the US. Natural gas is a premium fuel, since it can be burned readily and cleanly. The main problem with methane is its storability and transportability. Pipelines are required, which if not available, are expensive to install. Methane being a cryogenic gas is not readily storable and, thus, generally must be consumed on demand. Although, at present, supply is not a problem, there is much shut-in gas wells in areas remote from pipelines and wells or gas which is of poor quality. This gas cannot be presently used without processing to a clean pipeline quality gas. The authors describe a new process that addresses the two problems of utilization and conversion of natural gas to a premium fuel based on substandard natural gas wells. The process involves the reaction of methane with carbon dioxide to produce carbon black and water.

Current data on natural and supplemental gas consumption, disposition, production, prices, storage, imports, and exports in the United States are provided for each year from 1982 through Feburary 1988 with monthly data for the most recent three years. Some data are also given by state or city; some data are also given for previous years. Operating and financial data for major interstate natural gas pipeline companies, as well as data on filings, ceiling prices, and transportation under the Natural Gas Policy Act of 1978, are also included. 6 figs., 33 tabs.

35707 **(PB—88-188867/XAB) Competitive position of natural gas: industrial frying. Topical report, December 1986-January 1988.** Minsker, B.S.; Salama, S.Y. (Energy and Environmental Analysis, Inc., Arlington, VA (USA)). Jan 1988. 54p. NTIS, PC A04/MF A01.

To quantify the competitive position of natural gas in industrial frying processes, market profiles were developed to define current technologies and to characterize the applications and use of each technology in industrial-frying applications. Important cost and performance parameters were identified and validated through extensive interviews with industry representatives. Interviews also focused on current practices and fuel choice, expectations for future process developments that could affect natural gas use, and recommendations for research that could improve the effectiveness of gas-fired fryers.

35708 **(PB—88-188883/XAB) Competitive position of natural gas: industrial solids drying. Topical report, May 1985-January 1988.** Minsker, B.S.; Salama, S.Y.; Olsen, K.G. (Energy and Environmental Analysis, Inc., Arlington, VA (USA)). Jan 1988. 228p. NTIS, PC A11/MF A01.

To quantify the competitive position of natural gas in industrial solids drying, market segments were developed according to technology competition issues, The drying market was segmented by feed state, drying temperature, and degree of tolerable contamination to group dryers and products with similar technology characteristics. Important cost and performance parameters were identified and validated through interviews with industry representatives. Current practices and fuel choice, expectations for future process developments that could affect natural gas use, and recommendations for research that could improve the effectiveness of natural-gas-fuel drying technologies are described in the report.

35709 **(PB—88-196381/XAB) Competitive position of natural gas: industrial baking. Topical report, December 1986-January 1988.** Minsker, B.S.; Salama, S.Y. (Gas Research Inst., Washington, DC (USA). Strategic Analysis and Energy Forecasting Div.). Jan 1988. 68p. NTIS, PC A04/MF A01.

See also PB—88-196399.

To quantify the competitive position of natural gas in industrial baking, market profiles were developed to define current technologies (single lap, tunnel, and Lanham ovens are predominant) and to characterize the applications and use of each technology in industrial baking. Important cost and performance parameters were identified and validated through interviews with industry representatives. Two areas of research that could improve technologies' effectiveness are advanced burner controls activated based on oven load that could reduce product loss, the largest coast associated with the oven, and cogeneration, which could penetrate the baking market if the high capital costs associated with existing equipment could be reduced.

35710 **(PB—88-196399/XAB) Competitive position of natural gas: drying of paints and coatings. Topical report.** Holmes, J.G.; Duleep, K.G.; Olsen, K.G. (Gas Research Inst., Washington, DC (USA). Strategic Analysis and Energy Forecasting Div.). Mar 1988. 183p. NTIS, PC A09/MF A01.

See also PB—88-196381.

This study provides insights into the important technological and economic factors influencing the future competitiveness of natural-gas-fueled paint drying technologies. The report focuses on the performance factors influencing fuel and oven selection, and relates these performance factors to the capabilities of existing gas-fired equipment and to the requirements likely to be placed on new gas technologies. Four applications were selected for detailed case studies: beverage can coatings, coil coatings, automobile paints, and appliances paints. At current energy prices, natural gas is the primary choice for drying of paints and coatings in most applications. In the future, factors other than energy prices will become more important in fuel choice. For example, control of volatile organic compound (VOC) emissions and process control flexibility and startup/shutdown are important factors in some applications.

35711 **(PB—88-197157/XAB) Assessment of opportunities for gas-fired sintering in the advanced-ceramics and powdered-metals industries. Topical report, June 1986-May 1987.** Messing, G.L.; Koss, D.A. (Pennsylvania State Univ., University Park (USA). Center for Advanced Materials). Jun 1987. 43p. (CAM—8702). NTIS, PC A03/MF A01.

Almost the entire ceramics industry and a portion of the metals industry rely on the use of high temperatures to effect densification of powder preforms (sintering). Many of these materials are sintered in electrically heated furnaces. The development and implementation of gas-fired heating systems in these growing industries could potentially increase natural gas usage. The project was designed to determine the technical requirements for gas-fired sintering technology in these industries and to assess the potential for implementing such a technology.

35712 **(DOE/RA/33101—2551) Demonstration projects for coalbed methane and Devonian shale gas: Final report.** Verrips, A.M.; Gustavson, J.B. (Gustavson Associates, Inc., Boulder, CO (USA)). Apr 1987. Contract FG21-79RA33101. 38p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88001053/JAW.

In 1979, the US Department of Energy provided the American Public Gas Association (APGA) with a grant to demonstrate the feasibility of bringing unconventional gas such as methane produced from coalbeds or Devonian Shale directly into publicly owned utility system distribution lines. In conjunction with this grant, a seven-year program was initiated where a total of sixteen wells were drilled for the purpose of providing this untapped resource to communities who distribute natural gas. While coalbed degasification ahead of coal mining was already a reality in several parts of the country, the APGA demonstration program was aimed at actual consumer use of the gas. Emphasis was therefore placed on degasification of coals with high methane gas content and on utilization of conventional oil field techniques. 13 figs.

(Sandia National Labs., Albuquerque, NM (USA); National Inst. for Petroleum and Energy Research, Bartlesville, OK (USA); Dowell Schlumberger (USA)). 1988. Contract AC04-76DP00789. 31p. (CONF-880624—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009694/JAW.

From SPE gas technology symposium: gas supply - a critical balance of politics, the market place, and technology; Dallas, TX, USA (13 Jun 1988).

Extensive production testing and core analyses show that prestimulation production from the low-permeability sandstones in the Mesaverde formation at the Department of Energy's Multiwell Experiment (MWX) field laboratory is dominated by natural fractures. Experience gained during MWX stimulations in these tight Mesaverde reservoirs strongly suggests that damage to the narrow natural fractures is an important factor affecting poststimulation production. This paper summarizes the field data showing both evidence for production from natural fractures and evidence for interactions between natural fractures and stimulation fluids resulting in decreased gas production. The nature of these interactions is clarified through a description of laboratory studies dealing with the degradation of the stimulation fluids and with the permeability damage of artificially fractured core exposed to the stimulation fluids. Evidence is very strong that damage from stimulation fluids to the narrow natural fractures restricted the production of gas in early MWX stimulations, a hypothesis that is consistent with the partial reversibility of fluid damage in the natural fractures of one zone following a long-term shut-in. A controlled breaker system was designed for use with the relatively clean, temperature-stable biopolymer foam. Use of this fluid system in a later MWX stimulation substantially increased gas production and reduced evidence of damage. 48 refs., 11 figs., 8 tabs.

35714 **(PB—88-202635/XAB) Effectiveness of cathodic protection. Phase 3. Final report, March 1983-June 1984.** Ruck, G.T.; Walcott, K.J.; Thompson, N.G.; Barlo, T.J. (Battelle Columbus Div., OH (USA)). Nov 1985. 100p. NTIS, PC A05/MF A01.

See also PB—87-181962.

Cathodic protection is one method used to control corrosion on buried gas-distribution piping. Proper interpretation of the level of cathodic protection requires appropriate correction or compensation be made in the pipe-to-soil potential for errors from IR drop in the soil and from stray AC and/or DC interferences. A microprocessor-based prototype instrument to make this correction on piping protected by impressed-current systems was designed, fabricated, and evaluated in the field. The instrument performed as designed, however modification is required before final design. An unexpected spike or transient in the pipe-to-soil potential waveform from some rectifiers interferred with accurate polarized potential measurements in many cases. Future software modifications are expected to identify and accurately treat most of these situations and improve AC rejection. Commercialization appears to be economically feasible. Laboratory experiments have demonstrated that the AC-impedance techniques appear to be feasible to assess the corrosion rate of unprotected steel, and the corrosion state of buried steel protected by either impressed-current or sacrificial-anode systems. Two AC impedance parameters that correlate well with the corrosion state have been identified. An instrument design concept embodying this technique for buried piping has been developed and further research and development is planned.

35715 **(PB—88-202676/XAB) Development of an equation of state for computation of supercompressibility factors, critical flow factors, and other properties for wet, sour natural gases, synthetic gases, and admixtures. Final report, October 1984-September 1987.** Starling, K.E.; Mannan, M.; Savidge, J.L.; Sadasivan, S.; Reid, T.B. (Oklahoma Univ., Norman (USA). School of Chemical Engineering and Materials Science). Sep 1987. 217p. NTIS, PC A10/MF A01.

See also PB—87-209987.

The research effort has extended the highly accurate compressibility/supercompressibility factor correlation for sweet/dry natural gases developed in 1981-1984 to include water and hydrogen sulfide. In the temperature and pressure range where most custody transfers take place, the correlation is accurate within 0.1% or better in the supercompressibility factor. One of the conclusions reached in the work is that a more-extensive high-quality PVT data base for wet/sour natural gases is needed to further test the correlation. The revised alternate characterization methods developed in the work allow faster and simpler calculations resulting in large reductions in computer time when compared with the alternate characterization methods presented in A.G.A. Report No. 8. The prediction accuracies for these methods are comparable or slightly better than the A.G.A. Report No. 8 alternate characterization methods. As compared to the A.G.A. Report NX-19 alternate characterization methods, the methods developed in the work require similar computer time, while giving dramatically more accurate results. The equation-of-state method has been applied for prediction of highly accurate sonic velocities and critical flow factors for use with sonic nozzles. The prediction of the sonic velocity is shown to be generally accurate within plus or minus 0.1% at reasonable operation conditions for sonic nozzles. The prediction of critical flow factors is also shown to be more accurate than the Johnson method.

During the fourth year of the project, the design of the heater and its associated oil-cooling-loop miniplant was finalized and installation initiated. Delays in obtaining construction and new source emissions permits led to delays in installing the heater system at the Evergreen Oil Co. field test site. The burner assembly design was finalized and successfully tested. Installation at the field-test site is scheduled to be completed by December, 1987. A paper was presented at the 14th Annual Energy Technology Conference detailing the design of the heater, and two patents were issued covering the heater design and the use of Zone-Controlled Pyrocore burners.

35718 **(DOE/FE—8010424) Plan for protection of oil and natural gas resources Naval Oil Shale Reserve No. 1 and No. 3, Garfield County, Colorado.** (USDOE, Washington, DC). Oct 1987. 33p. NTIS, PC A03;3. Order Number DE88010424/JAW.

This plan provides for the protection of the Government's interest in hydrocarbons found in Naval Oil Shale Reserve No.1 (NOSR-1) and Naval Oil Shale Reserve No. 3 (NOSR-3) located in GArfield County, Colorado, and complements a similar plan developed in 1983. Recent development of private property near NOSR-3 exceeds the activity contemplated in the 1983 plan, and has progressed to drilling units on land which, under Colorado spacing orders, would include at least 50 percent NOSR-3 land. Due to the proximity of these commerical gas wells to NOSR-3 land, it is estimated that gas produced from the wells would include gas which had migrated from NOSR-3. To protect the Government's interest in these and other such wells which may be drilled near NOSR-1 or NOSR-3, the Department's plan of primary protection is to enter into communitization agreements with the private developers when they initiate wells which would drain NOSR-1 or NOSR-3 hydrocarbons. In general, these agreements would permit the sharing of costs and hydrocarbon production based on surface acreage owned by each party in each of the drilling units. If attempts to obtain such agreements fail, or if it is determined that offset wells are needed in addition to the communitized units, the Department plans to drill and produce wells on NOSR-1 and NOSR-3 which would offset production from nearby wells on private lands. These measures will preclude the migration of NOSR-1 and NOSR-3 hydrocarbons to privately-owned wells, and protect the Government's resources. The results of the Department of Justice anti-trust review performed pursuant to Section 7430(g) of title 10, United States Code, are provided as a part of this plan at Exhibit N.

35719 **(DOE/MC/11076—2449) Mathematical comparisons with the inclined fluidized bed retort.** Mones, C. (Western Research Inst., Laramie, WY (USA)). Nov 1987. Contract FC21-86MC11076. 10p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88006022/JAW.

A one-dimensional oil shale retorting model was used to simulate inclined fluidized bed retorting of western oil shale. The calculated oil yields agree fairly well with data from previous experiments because the stoichiometry and kinetics of western oil shale pyrolysis do not depend strongly on heating rate. Although the model produces acceptable results with western shales, an understanding of the retorting mechanism for eastern shales at high heating rates is necessary to properly predict oil recoveries under fluid bed conditions. 6 refs., 3 tabs.

35720 **(DOE/MC/22134—2539) Fluidized-bed retorting of Colorado oil shale: Topical report.** Albulescu, P.; Mazzella, G. (Foster Wheeler USA Corp., Clinton, NJ). Jun 1987. Contract AC21-86MC22134. 594p. NTIS, PC A25;3. Order Number DE88001036/JAW.

In support of the research program in converting oil shale into useful forms of energy, the US Department of Energy is developing systems models of oil shale processing plants. These models will be used to project the most attractive combination of process alternatives and identify future direction for R & D efforts. With the objective of providing technical and economic input for such systems models, Foster Wheeler was contracted to develop conceptual designs and cost estimates for commercial scale processing plants to produce syncrude from oil shales via various routes. This topical report summarizes the conceptual design of an integrated oil

shale processing plant based on fluidized bed retorting of Colorado oil shale. The plant has a nominal capacity of 50,000 barrels per operating day of syncrude product, derived from oil shale feed having a Fischer Assay of 30 gallons per ton. The scope of the plant encompasses a grassroots facility which receives run of the mine oil shale, delivers product oil to storage, and disposes of the processed spent shale. In addition to oil shale feed, the battery limits input includes raw water, electric power, and natural gas to support plant operations. Design of the individual processing units was based on non-confidential information derived from published literature sources and supplemented by input from selected process licensors. The integrated plant design is described in terms of the individual process units and plant support systems. The estimated total plant investment is similarly detailed by plant section and an estimate of the annual operating requirements and costs is provided. In addition, the process design assumptions and uncertainties are documented and recommendations for process alternatives, which could improve the overall plant economics, are discussed.

35721 **(UCRL—98064) Isothermal pyrolysis and char combustion of oil shales.** Coburn, T.T.; Taylor, R.W.; Morris, C.J.; Duval, V. (Lawrence Livermore National Lab., CA (USA)). 3 Feb 1988. Contract W-7405-ENG-48. 9p. (CONF-880589—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88010709/JAW.

From International conference on oil shale and shale oil; Beijing, China (16 May 1988).

Yields and rates of hydrocarbons evolved during pyrolysis of oil shales have been measured with improved accuracy. Green River and New Albany oil shales were heated in a fluidized sand bed, and volatile pyrolysis products were transferred to a combustion tube and burned. Resulting H_2O and CO{sub 2 were detected in real time by mass spectrometry. Residual char was subsequently burned to allow complete C and H balances. Good closure was obtained. Proportions of organic C and H released as pyrolysis products and retained as char were determined. Shale oil loss due to the presence of oxidized shale in the fluidized bed was measured accurately. We find that all of the experimental apparatus that the pyrolysis gas contacts must be near pyrolysis temperature to avoid condensation of heavy oil which subsequently forms coke and secondary products. We observe a faster release of products with all transfer lines 450{degree}C than when they are at 300{degree}C. The current uncertainty in pyrolysis rates is due in part to such difficulties with experimental techniques. 12 refs., 7 figs., 1 tab.

35722 **Analysis of polynuclear aromatic hydrocarbons in shale oil and diesel particulates.** Tan, Y.L. (Dept. of Energy, New York, NY (USA)). *Analytical Letters;* 21: No. 4, 553-562(Apr 1988).

The authors participated in the interlaboratory studies conducted by the National Bureau of Standard/Department of Energy (NBS/DOE) Analytical Characterization Group in which shale oil and diesel particulates were analyzed for three ring to six ring polynuclear aromatic hydrocarbons (PAH). Diesel particulates were extracted by Soxhlet or ultrasonic extraction. The PAH fraction was isolated with Sephadex LH-20 gel filtration chromatography and silica gel adsorption chromatography. The individual PAH was identified and quantitated with a gas chromatography/flame ionization detector and computerized gas chromatography/mass spectrometry. The combination of gel filtration and adsorption chromatography was found to be effective in isolating PAH from various complex sample matrices for further instrumental analysis. The results compared favorably with methods used among the other participating laboratories.

35723 **Ammonia evolution during oil shale pyrolysis.** Oh, M.S.; Taylor, R.W.; Coburn, T.T.; Crawford, R.W. (Lawrence Livermore National Lab., CA (USA)). *Energy and Fuels;* 2: No. 1, 100-105(Jan-Feb 1988). Contract W-7405-ENG-48.

Ammonia ((NH_3)) evolution during pyrolysis of three Green River Formation shales and one Eastern (Devonian) shale was studied. The yields of NH_3 from Fischer assay type experiments were measured with an NH_3-sensing electrode, and the time-dependent rate of NH_3 evolution was measured with a triple-quadrupole mass spectrometer. We varied the peak temperature (PT) of the pyrolysis from 350 to 750 2{C and the heating rate from 1 to 50°C/min. The NH_3 yields increased rapidly above the oil-generating temperatures to a maximum at PT $\sim$ 700°C and then decreased at PT $>$ 700°C because of the decomposition of NH_3. The NH_3 yield showed no dependence on the heating rate at PT $<$ 550°C and decreased with increasing heating rate at higher peak temperatures. For Green River Formation shales, the yield of NH_3 at PT $<$ 500°C reflected the organic nitrogen content. The extent of NH_3 decomposition varied with gas environments, solid surface, and the conditions of the retort can. Because steam works as an inhibitor for the decomposition reaction, we used steam as a retorting gas to obtain the total yield of NH_3. We developed a kinetic model for NH_3 evolution; it takes into account NH_3 generation from organic and inorganic nitrogen sources and NH_3 decomposition.

35724 **(CANMET-SS—1) Minerals, metals and mining technologies. Minerals processing-research and development.** Sirois, L.L.; MacDonald, R.J.C. (eds.). (Canada Centre for Mineral and Energy Technology, Ottawa, Ontario). Dec 1983. vp. NTIS (US Sales Only), PC A07/MF A01. Order Number DE88780077/JAW.

Selected papers were processed for inclusion in the Energy Data Base.

35725 **(FRCEA-TH—65) Hydrogeochemistry of uranium, daughter products and associated elements (lanthanides), application to ore prospection.** Toulhoat, P. (Paris-6 Univ., 75 (France); CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Chimie Appliquee et d'Etudes Analytiques). Sep 1987. 297p. (In French). NTIS (US Sales Only), PC A13/MF A01. Order Number DE88753966/JAW.

The behavior in ground water of uranium, daughter products with long half life (U^{234}, Th^{230}, Ra^{226}) and stable (radiogenic lead) and lanthanides is studied by two complementary methods: 1) In situ multielement tracing in fracturated granitic rocks and porous sedimentary rocks of low permeability allowing to understand interactions between hydrodynamics and geochemistry. 2) Study of the properties of U^{234} and Pb^{210} which are mineralization tracers and are relatively independent of redox conditions, on the contrary U 238 has a low solubility in reducing medium. Three areas are studied: Bazois and Lodeve basin (France) and Cigar Lake

(Canada). Radioactive disequilibriums are thoroughly studied when required by orerock interaction. Adsorption-desorption phenomena are of great importance in proposed prospection models. If prospection models based on alpha activity ratio $U^{234}U^{238}$ and lead isotope ratio in ground water can be applied, an integrated prospection model requires more in situ and laboratory experiments.

35726 (GSCan-P—85-1B, pp 23-31) **Uranium and other trace and minor element concentrations in surface rocks and stream sediments from the Cypress Hills, Saskatchewan.** Dyck, W.; Bell, R.T. (Geological Survey of Canada, Ottawa, Ontario). 1985. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88780080/JAW.

In Current research.

Surface rock samples from traverses of two buttes and a clay pit in the Cypress Hills near Eastend, Saskatchewan were collected and analyzed for 27 trace and minor elements. The results show that most trace elements, particularly U, are markedly enriched in some coaly layers relative to others and the other rocks of the formations in general. U concentrations of up to 1200 ppm were encountered in seams in the Ravenscrag Formation of Anxiety Butte. Excess U, relative to its daughter Ra, in one coaly layer suggests that U is accumulating or Ra depleting at a faster rate than its homologue; in another the reverse phenomenon was observed.

35727 (INIS-BR—1093) **Estimation grade of uranium from drill hole gamma logs.** Juliao, B. (NUCLEBRAS, Rio de Janeiro (Brazil)). 1986. 12p. (In Portuguese). (CONF-8610278—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702790/JAW.

From 34. Brazilian congress of geology; Goiania, Brazil (12 Oct 1986).

Radiometric grade of uranium deposits can be determined from drill hole gamma logs. The calculation of uranium oxide content can be obtained with good precision when the uranium ore is in radioactive equilibrium, containing only a small amount of thorium and no interference of potassium. This is the case of uranium ore from the Lagoa Real Uranium Province presented in this paper. The radioactive disequilibrium study in this province were made working over nine hundred samples analised with this special purpose in the CDTN-NUCLEBRAS laboratories. The data obtained indicated that the uranium in the ore is in perfect equilibrium with their daughter gamma emitters. Futhermore, the amount of Th and K is of no significance, so that the gamma counting represents exactly the uranium content of the ore.

35728 (INIS-BR—1096) **Itataia ore deposit - Caracterization of the massif according alteration/argilization and estimation of material volume inside a pit.** Alcantara e Silva, J.R. de. (NUCLEBRAS, Fortaleza (Brazil)). 1986. 15p. (In Portuguese). (CONF-8610278—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702792/JAW.

From 34. Brazilian congress of geology; Goiania, Brazil (12 Oct 1986).

This paper sumarizes the geotechnically characterization of the Itataia ore deposit according to the relationship rock alteration/argilization. Through this charaterization it was defined three types of material related to the degree of alteration and argillization: Type I (fresh or pratically fresh and little or monargillized material); Type II (partially altered and argillized material). The new geological syntesis and iformation, together with seismic parameters allowed to a material classification according to the scarificability, and important factor in the costs of an open pit mine.

35729 (INIS-BR—1097) **Itataia's deposit - Structural zoning of a pit until the level 480 meters.** Mendonca, J.C.G.S. (NUCLEBRAS, Fortaleza (Brazil)). 1986. 9p. (In Portuguese). (CONF-8610278—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702793/JAW.

From 34. Brazilian congress of geology; Goiania, Brazil (12 Oct 1986).

This work is part of Itataia Project-Geotechnics; in it are introduced several comments concerning the structural zoning of a pit in Itataias' phosphorous-uranipherous deposit, until the level 480 meters. The structural parameters (fractures, faults, foliations) obtained in surface and underground works were statistically treated. Stereographic projection was used to define eventual slipping into the pit. All the data were arranged in tables to make it easy the comparison with experimental pits.

35730 (INIS-BR—1098) **Uranium occurence in the Rio Cristalino area, South of Para.** Andrade, S.M. de; Ribeiro, E.; Camarco, P.E.N.; Puppin, C.; Santos Filho, J.L. dos. (NUCLEBRAS, Goiania (Brazil)). 1986. 15p. (In Portuguese). (CONF-8610278—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702794/JAW.

From 34. Brazilian congress of geology; Goiania, Brazil (12 Oct 1986).

The Rio Cristalino area where occurs uranium mineralization is located in the Western part of the Santana do Araguaia Town, Para State. This area comprises 1.350 Km^2, and was selected from the evolution of the 'Projeto Geofisico Brasil - Canada - PGBC'. According to the results obtained from this Project, 15 airbone anomalies were selected for ground check. In the anomalies AN-03 and H-09 were found the best uranium occurence. The host rocks consist of arkose and sandstone of Pre-Cambriam ages, which show a very low-grade of metamorphism. The primary mineralization occurs in arkose along the cataclastic foliation (N70°W 65°NE). The secundary mineralization involves clay galls and fills fracture zones in sandstone of the anomaly H-09. The highest grade detected in a rock sample of the anomaly AN-03 was 6,1% U_3O_8, whereas in the trenches there are intervals of 6 m thickness with a grade of 0,59% U_3O_8. Based on some mineralization aspects and field data, the genetic conceptual model to the uranium mineralization is proposed.

35731 (INIS-BR—1099) **Itataia's phosphorous-uraniferous deposit - Alteration and argilization influence in physical processing of the mineralized lithologies.** Rosa, C.V. (NUCLEBRAS, Fortaleza (Brazil)). 1986. 15p. (In Portuguese). (CONF-8610278—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702795/JAW.

From 34. Brazilian congress of geology; Goiania, Brazil (12 Oct 1986).

This study was developed by NUCLEBRAS, firstly defining the quality and quantity of the Itataia ore body untill the 480 m level of the future pit, considering the lithological types, the P_2O_5 and U_3O_8 contents and the alteration and argillization of the rocks. The following step was to establish the physicochemical character of the mineralized lithologies according to the phases of alteration-argillization. Finally it was compared the results of these two stages with the results of the pilot treatment, related to the gangue in the phosphoric acid concentrate. The method showed the difficulties in each host rock, differently alteredargillized for future process and allowed to the identification of seven types of material to supply the Itataia pilot plant.

35732 (INIS-BR—1095) **Isotope disequilibria 4n series in the Morro do Ferro System, Pocos de Caldas (MG).** Bonotto, D.M.; Fujimori, K. (UNESP, Rio Claro (Brazil). Inst. de Geociencias e Ciencias Exatas). 1986. 15p. (In Portuguese). (CONF-8610278—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702869/JAW.

From 34. Brazilian congress of geology; Goiania, Brazil (12 Oct 1986).

Thorium isotopic analyses were performed on well spoils of the main ore body at Morro do Ferro, Pocos de Caldas (MG), on groundwaters from several boreholes in the area and surface waters from a stream that originates at the base of the hill. For extraction of thorium a long chemical process was applied to samples; activities of Th-228 and Th-232 isotopes (4n series) were determined by alpha spectrometry method. The rations Th-228/Th-232 determined for well spoils did not show marked disequilibria between these isotopes. In ground and surface waters, the ratios Th-228/Th-232 showed marked isotopic fractionation between these nuclides, not related to selective leaching of Th-228 in relation to Th-232 or recoil of Th-228 nucleons.

35733 **Plutonium aerosol generation in reducing and oxidizing atmospheres at high temperatures.** Eidson, A.F.; Yeh, H.C.; Kanapilly, G.M. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (USA). Inhalation Toxicology Research Inst.). *Journal of Nuclear Materials;* 152: No. 1, 41-52(Mar 1988). Contract AC04-76DP00789;W-7405-ENG-48;W-7405-ENG-36;AC04-76EV01013.

Delta-phase plutonium metal pellets and foils were heated at 450°C in reducing atmospheres (3% H_2 + 97% Ar or 3% H_2 + 5% N_2 + 92% Ar), and the respirable aerosols were collected and characterized. Residues of plutonium hydriding reactions were also heated at 450°C in air. The percentages of initial radioactivity released as respirable aerosols under hydriding or oxidizing conditions were not significantly different. Surface area to mass ratio was not a significant factor, nor was linear gas flow velocity between 40 and 1000 cm s^{-1}. The average percentage of initial radioactivity generated as respirable particles was 0.021% with a worst-case value of 0.46%. These percentages agree with those of previous research in which only air or O_2 and N_2 mixtures were used in a static reaction, and are significantly less than those generated by particles freely falling in air. The activity median aerodynamic diameters of the various aerosol size distributions were variable, but ranged from 4 to approximately 10 μm. The mass median diameter of powdered residues was highly variable, ranging from 4 to > 350 μm. The particle size distribution of aerosols or powder residues was not related to the types of reaction atmosphere studied. These results support the conclusion that the major factors influencing the amount of particulate residues and their particle sizes are those that influence the integrity of a protective oxide layer, rather than the reducing or oxidizing nature of the reaction atmosphere.

35734 **(ES/ESH—4/V4) Environmental surveillance of the US Department of Energy Portsmouth Gaseous Diffusion Plant and surrounding environs during 1987.** Aaron, M.R. (ed.); Rogers, J.G.; Wiehle, W.E.; Valentine, B.L.; Acox, T.A.; Goslow, G.A.; Bracknell, A.K.; Homerosky, F. Jr.; Timmons, G.A.; Strange, R.A. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA); Martin Marietta Energy Systems, Inc., Piketon, OH (USA)). Apr 1988. Contract AC05-84OR21400. 226p. (POEF—1180). NTIS, PC A11/MF A01;1; GPO Dep. Order Number DE88010749/JAW.

This report consists of two parts: summary, discussion, and conclusions (Part 1) and data presentation (Part 2). The objectives of this report are the following: Report 1987 monitoring data for the installation and its environs that may have been affected by operations on the plant site. Provide reasonably detailed information about the plant site and plant operations. Provide detailed information on input and assumptions used on all calculations. Provide trend analyses, where appropriate, to indicate increases and decreases in environmental impact. Provide general information on plant quality assurance. Routine monitoring and sampling for radiation, radioactive materials, and chemical substances on and off the DOE site are used to document compliance with appropriate standards, identify trends, provide information for the public, and contribute to general environmental knowledge. The surveillance program assists in fulfilling the DOE policy of protecting the public, employees, and the environment from harm that could be caused by its activities and reducing negative environmental impacts to the greatest degree practical. Environmental monitoring information complements data on specific releases, trends, and summaries.

35735 **(K/ITP—172) Development of a 20-ton-capacity load-cell-based weighing system for IAEA [International Atomic Energy Agency] field use.** Cooley, J.N.; Huxford, T.J. (Oak Ridge Gaseous Diffusion Plant, TN (USA). International Technology Programs Div.; Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OT21400. 12p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009774/JAW.

A 20-ton-capacity Load-Cell-Based Weighing System (LCBWS) is being developed to provide the International Atomic Energy Agency (IAEA) with a portable means of verifying the masses of 10- and 14-ton UF_6 cylinders at UF_6-bulk-handling facilities subject to IAEA safeguards inspections. The system is being designed to meet IAEA objectives for portability and accuracy as well as to meet facility operating safety conditions. During the development effort, system design requirements were established, and a comprehensive survey of commercially available weighing equipment against these requirements was conducted. Detailed equipment specifications for 20 load cells from 13 manufacturers, for 5 digital crane scales from 3 manufacturers, and for 7 digital weight indicators from 5 manufacturers were compared. The results of the survey favored a configuration based on a custom-designed load cell integrated with a commercially available digital weight indicator. Safety certification of the system by an internationally recognized verification authority is also recommended. Comparison criteria and their effect on the LCBWS design requirements are discused,and the status of the project is reported. 2 refs., 2 figs., 2 tabs.

35736 **(K/QT—141) Development of the simplified compressor model (SCM) for performance analysis of gaseous diffusion compressors.** Baker, S.T. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). Oct 1987. Contract AC05-84OT21400. 22p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009066/JAW.

This report documents the progress on the FY 87 K-site Milestone (for the Process Equipment and System Performance (PESP) team of the Process and Long Range Technical Support (P&LRTS) program) which calls for the formulation of "simplified compressor performance prediction codes for use in GDP cascade models." In particular, the features, benefits, steps in the development, and results of a simplified compressor model (referred to as the SCM) for predicting the off-design performance of compressors used in the gaseous diffusion process are discussed. Calculations for the T7 compressor were performed at 1700 hp and at discharge temperatures of 265{degree}F, 290{degree}F, and 315{degree}F (these temperatures representing all temperatures at 1700 hp for which experimental data is available). The results of these calculations are shown in Figures 8--10. Note that the SCM does a much improved job in predicting the efficiency and A-stream volume flow rate than the larger, more complex code, DYNADEC. Agreement between test data and the SCM calculations for static pressure ratios and B-stream equivalent volume flow is comparable to that obtained by DYNADEC. Each set of four performance maps required approximately one minute of CPU on a VAX 8600 using the SCM (compared to nearly one hour of CPU using DYNADEC). 10 figs.

35737 **Competitiveness through change: institutional restructuring of the United States uranium enrichment enterprise.** Longenecker, J.R. (Department of Energy, Washington, DC (USA). Office of Uranium Resources and Enrichment). pp 280-291 of Uranium and nuclear energy: 1986. Proceedings of the 11. international symposium held by the Uranium Institute, London, UK, 2-4 September 1986. London, England; Uranium Institute (1987). (CONF-860915—).

From 11. annual symposium of the Uranium Institute; London, UK (3 Sep 1986).

The position of the United States programme of uranium enrichment under the Department of Energy is explained. Its competitiveness has improved over the past few years by normalising supply and demand and by streamlining the costs of gaseous diffusion plant production. The historical aspects of the uranium enrichment service are explained. Revised criteria to describe the guidelines to cover pricing, contracting and other crucial functions are under discussion. Two aspects of the new criteria of particular interest -restrictions on foreign-origin uranium and recovery of Government costs - are noted. Possible private sector involvement in uranium enrichment is discussed. Technological innovations are explained and equipment illustrated. These should improve the industry's competitiveness. (U.K.).

35738 Determination of isotopic ratios from fuel burnup. Lee, J.C.; Hsue, S.T. (The Univ. of Michigan, Dept. of Nuclear Engineering, Ann Arbor, MI (US)). *Nuclear Technology;* **76**: No. 2, 203-208(Feb 1987).

Based on a simplified solution of the balance equations for concentration of uranium and plutonium isotopes and a set of two-group microscopic cross sections, isotopic ratios, /sup 235/U/U, Pu/U, and /sup 239/Pu//sup 235/U, are calculated as a function of fuel burnup for pressurized water reactor spent fuel. The two-group cross sections for /sup 235/U, /sup 238/U, /sup 239/Pu, and water are collapsed into equivalent thermal-group constants, with the fast-to-thermal flux ratio obtained through a two-group criticality consideration. For this purpose, parasitic neutron captures are represented through a simple semiempirical relationship. The calculational model, incorporated as the BURN code, yields isotopic ratios that compare favorably with three major data sets from the ISTLIB data bank.

35739 (CONF-880752—2) Measuring operator skill and teleoperator performance. Draper, J.V.; Wrisberg, C.A.; Blair, L.M.; Schrock, S.L.; Omori, E. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 13p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011393/JAW.

From International symposium on teleoperation and control; Bristol, UK (12 Jul 1988).

This paper describes efforts at the Oak Ridge National Laboratory (ORNL) to measure (1) remote handling skill and (2) teleoperator performance. These experimental activities are part of a joint collaboration between the US Department of Energy (USDOE) and the Power Reactor and Nuclear Fuel Development Corporation (PNC) of Japan in the field of the Nuclear Fuel Cycle: Reprocessing Technology. A valid operator skill test would have many experimental and operational uses, including operator selection and qualification, training program evaluation, assignment of subjects to experimental groups, as a predictor in linear regression or analysis of covariance. ORNL and Japan's PNC have developed a skill test and conducted a validation study. The test predicts performance of a more realistic remote handling task in an ORNL validation study. One flaw in the skill test is that it only uses rate of performance as a skill index. The paper discusses pitfalls of depending on a single criterion and identifies four classes of performance criteria. Performance criteria may assess the rate of performance, the quality of performance, teleoperator impact on the operator, and teleoperator impact on the remote environment. Since there may be trade-offs among the performance domains, using a criterion set which fails to measure all four domains may be misleading or fail to discover important effects.

35740 (DP-MS—88-64-Rev.2) Plutonium scrap recovery at Savannah River: Past, present, and vision of the future. Gray, L.W.; Gray, J.H.; Blancett, A.L.; Lower, M.W.; Rudisill, T.S. (Savannah River Lab., Aiken, SC (USA)). 1988. Contract AC09-76SR00001. 20p. (CONF-880537—5-Rev.2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010615/JAW.

From 12. actinide separations conference; Naperville, IL, USA (9 May 1988).

As a result of the changing requirement, plus environmental and regulatory commitments, SRP now has essentially completed its paradigm shift. SRP has been transformed from primarily a reprocessor of irradiated uranium targets to primarily a reprocessor of non-specification plutonium. This is the mission which will carry SRP into the 21st Century. Accomplishment of the defined goals for the three-pronged R&D program will achieve several objectives: exploit new processes for recovering low-grade scraps; enhance SRP's position to incorporate pyrochemical processes where they are attractive or beneficial to plant scrap recovery; provide SRL/SRP with a capability to develop compatible aqueous pyrochemical processes; identify material compatibility requirements for the incorporation of pyrochemical processes at SRP; promote development and demonstration of improved NDA instrumentation to accurately measure plutonium holdups in solid residues; identify and implement the technology required for reagent preparation and atmospheric quality control; provide a means to compare economic options for emerging new processes; and as a result, identify process steps which will also put SRP in a position to readily adapt to changing plutonium missions.

35741 (INIS-mf—11194) Development of a simulation program to study error propagation in the reprocessing input accountancy measurements. Sanfilippo, L. (Rome Univ. (Italy)). 1987. 160p. (In Italian). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702373/JAW.

A physical model and a computer program have been developed to simulate all the measurement operations involved with the Isotopic Dilution Analysis technique currently applied in the Volume - Concentration method for the Reprocessing Input Accountancy, together with their errors or uncertainties. The simulator is apt to easily solve a number of problems related to the measurement sctivities of the plant operator and the inspector. The program, written in Fortran 77, is based on a particular Montecarlo technique named "Random Sampling"; a full description of the code is reported.

35742 (KFK—4329) Hydrodynamical models of extraction. Nagel, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Datenverarbeitung in der Technik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Wiederaufarbeitung und Abfallbehandlung). Dec 1987. 25p. (In German). (PWA—74/87). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753389/JAW.

The hydrodynamical operation of an extractor has been modelled. The basis of these models are first the subdivision of the extractor into well-mixed discrete stages, and second the diffusion. The calculations need material balances around each phase of a stage, or in a differential slice and the appropriate boundary conditions. The methods for getting time-independent solutions, fundamental differences of the models, as well as dependences of the results on operation parameters have been demonstrated. In the case of the discrete stage model time-dependent calculations have been performed, and the results showed clearly influences of different boundary conditions.

35743 (RFP—4226) Calculated phase diagrams of pyrochemical systems at the Rocky Flats Plant. Murray, A.M. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 1988. Contract AC04-76DP03533. 52p. (CONF-880537—7). NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010898/JAW.

From 12. actinide separations conference; Naperville, IL, USA (9 May 1988).

The phase diagrams can help in understanding the process. The approach taken is calculated binary and ternary phase diagrams and optimized thermodynamic parameters. The salt extraction system uses the salts Cs_2PuCl_6 and $CaCl_2$. Al, Mg, and Ca are used in the salt scrub system. Phase sections are given together with recommendations. (DLC)

35744 (GAO/RCED—87-123) Nuclear waste: Shipping damaged fuel from Three Mile Island to Idaho. (General Accounting Office, Washington, DC (USA)). 1987. 61p. General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The March 1979 accident at Three Mile Island produced about 150 tons of highly radioactive debris. The Department of Energy decided to ship the damaged nuclear fuel to Idaho because (1) of its facilities and radiological research expertise; (2) the shipping containers were designed and tested, and independently reviewed by the Nuclear Regulatory Commission to ensure that radioactivity would not escape during any credible accident; and (3) the criteria for route selection was the best quality track, shortest distance, and avoidance of large population centers.

35745 (PNL-SA—15396) Commercial use of byproduct cesium as an irradiation source. Chin, A.; Fairand, B.P.; Tingey, G.L. (Pacific Northwest Lab., Richland, WA (USA); Radiation Sterilizers, Inc., Menlo Park, CA (USA)). Feb 1988. Contract AC06-76RL01830. 11p. (CONF-880354—7). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008174/JAW.

From Waste management '88; Tucson, AZ, USA (1 Mar 1988).

Byproduct cesuim was recovered from Hanford nuclear waste following removal of the plutonium product and recovery of the enriched uranium from the spent nuclear fuel. The major incentive for recovery of the cesium, along with strontium, was reduction of the heat-generation rate in the waste tanks. Removal of these two heat-producing chemical species results in more than 90% reduction in heat generation in neutralized waste from 1-year-old fuel, and thus, much lower temperatures result in the tanks. The cesium was recovered from the Hanford waste stream beginning in 1967 and was purified and encapsulated from 1974 to 1983, resulting in 1576 capsules containing a total of about 75 MCi of ^{137}Cs. Although these capsules were designed to ease the handling of the waste, they also have substantial potential for use in industrial irradiators. The use of the WESF capsules to meet the demands of the medical industry turned out to be the most viable option, and several companies petitioned the US Department of Energy to obtain this material. To date, two commercial firms are using WESF cesium capsules in three commercial irradiation facilities. A third firm has recently leased a small amount of cesium. A total of 38 MCi in over 700 WESF capsules has been leased. 7 refs., 3 figs.

35746 Uranium mining viability issue in the USA. Clark, G. (USDOE Energy Information Administration, Washington, DC). pp 332-341 of Uranium and nuclear energy: 1986. Proceedings of the 11. international symposium held by the Uranium Institute, London, UK, 2-4 September 1986. London, England; Uranium Institute (1987). (CONF-860915—).

From 11. annual symposium of the Uranium Institute; London, UK (3 Sep 1986).

The viability of the uranium industry in the United States is discussed against the background of past and present government responsibilities in this area and pending legislation. The history of the uranium industry is outlined. Federal responsibilities over the industry are illustrated. Criteria for the viability of the US domestic uranium industry are listed. The three pieces of proposed legislation before the Congress are explained. The first is a resolution disapproving of the proposed enrichment services submitted by the Department of Energy in 1986. The second concerns trade sanctions against South Africa and the third concerns tailings reclamation and restrictions on imported uranium. (U.K.).

35747 (AERE-G—4393) Glass compositions suitable for PFR wastes. Annual progress report 1985-1986. Boult, K.A.; Dalton, J.T.; Eccles, E.W.; Hough, A.; Marples, J.A.C.; Paige, E.L.; Sutcliffe, P.W. (UKAEA Harwell Lab. Chemistry Div.; Department of the Environment, London (UK)). Sep 1987. 38p. (DOE-RW—87.095). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753504/JAW.

In previous work, a glass composition (PFR116) had been identified as suitable for vitrifying high level wastes from the Prototype Fast Reactor (PFR) fuel reprocessing plant. Further work has now shown that: (a) it is tolerant of quite large variations in the proportion of waste in the glass: (b) it could also be used to vitrify waste from the European Demonstration Reprocessing Plant. Current wastes from the PFR reprocessing plant contain Cu and Zn which arise from the use of a sacrificial brass basket to transfer chopped fuel to the dissolver. It was originally thought that the presence of the resulting CuO and ZnO in the glass would lead to increased corrosion rates of the Inconel alloys that are used in vitrification plants. Further compatibility tests have shown that this is not so although some Cu contamination of Inconel 690 does seem to occur.

35748 (AERE-R—12597) Initial study of the behaviour under repository conditions of inactive components of nuclear wastes. Biddle, P.; Rees, J.H. (UKAEA Harwell Lab. Chemistry Div.; Department of the Environment, London (UK)). Feb 1988. 80p. (DOE-RW—88.002). H.M. Stationery Office, London, price Pound 6.00.

This review extends the appreciation of repository behaviour to include the inactive components of wastes and their degradation products. These materials include a wide range of metals and organics, sludges and decommissioning wastes. The effect of degradation products on the solubility of long-lived radionuclides and any active daughters and their sorption on surfaces of the repository are assessed. Research requirements are identified that may help to improve significantly the assessment of the effects of inactive materials. Data required to improve the quality of inventory data on nuclear wastes are listed.

35749 (ANL/EES-TM—344) Assessing waste management systems using reginalt software. Meshkov, N.K.; Camasta, S.F.; Gilbert, T.L. (Argonne National Lab., IL (USA)). Mar 1988. Contract W-31109-ENG-38. 32p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008466/JAW.

A method for assessing management systems for low-level radioactive waste is being developed for US Department of Energy. The method is based on benefit-cost-risk analysis. Waste management is broken down into its component steps, which are generation, treatment, packaging, storage, transportation, and disposal. Several different alternatives available for each waste management step are described. A particular waste management system consists of a feasible combination of alternatives for each step. Selecting an optimal waste management system would generally proceed as follows: (1) qualitative considerations are used to narrow down the choice of waste management system alternatives to a manageable number; (2) the costs and risks for each of these system alternatives are evaluated; (3) the number of alternatives is further reduced by eliminating alternatives with similar risks but higher costs, or those with similar costs but higher risks; (4) a trade-off factor between cost and risk is chosen and used to compute the objective function (sum of the cost and risk); and (5) the selection of the optimal waste management system among the remaining alternatives is made by choosing the alternative with the smallest value for the objective function. The authors propose that the REGINALT software system, developed by EG & G Idaho, Inc., as an acid for managers of low-level commerical waste, be augmented for application to the managment of DOE-generated waste. Specific

recommendations for modification of the REGINALT system are made. 51 refs., 3 figs., 2 tabs.

35750 **(ANL/ES—151) Using geologic conditions and multiattribute decision analysis to determine the relative favorability of selected areas for siting a high-level radioactive waste repository.** Harrison, W.; Edgar, D.E.; Baker, C.H.; Buehring, W.A.; Whitfield, R.G.; Van Luik, A.E.J.; Sood, M.K.; Flower, M.F.J.; Warren, M.F.; Jusko, M.J.; Peerenboom, J.P.; Bogner, J.E. (Argonne National Lab., IL (USA)). May 1988. Contract W-31109-ENG-38. 109p. NTIS, PC E08/MF $7.15; 1; GPO Dep. Order Number DE88011219/JAW.

Includes 8 sheets of 48x reduction microfiche.

A method is presented for determining the relative favorability of geologically complex areas for isolating high-level radioactive wastes. In applying the method to the northeastern region of the United States, seismicity and tectonic activity were the screening criteria used to divide the region into three areas of increasing seismotectonic risk. Criteria were then used to subdivide the area of lowest seismotectonic risk into six geologically distinct subareas including characteristics, surface-water and groundwater hydrology, potential human intrusion, site geometry, surface characteristics, and tectonic environment. Decision analysis was then used to identify the subareas most favorable from a geologic standpoint for further investigation, with a view to selecting a site for a repository. Three subareas (parts of northeastern Vermont, northern New Hampshire, and western Maine) were found to be the most favorable, using this method and existing data. However, because this study assessed relative geologic favorability, no conclusions should be drawn concerning the absolute suitability of individual subareas for high-level radioactive waste isolation. 34 refs., 7 figs., 20 tabs.

35751 **(BMI/OCRD—27) Performance evaluations related to area characterization of crystalline rock.** (Golder Associates, Inc., Golden, CO (USA)). May 1988. Contract AC02-83CH10139. 166p. NTIS, PC A08/MF A01;1; GPO Dep. Order Number DE88011535/JAW.

This report discusses the use of performance-based procedures as a planning tool to assist the development and implementation of the Crystalline Rock Repository Project (CRP). Fundamentally, performance assessment is simply a method of expressing our knowledge about a site in a defensible quantitative manner in terms of meaningful performance criteria. Once developed, these procedures can be utilized as tools to assist the CRP in resolving specific program issues. Conceptually, this involves the ability to estimate site performance based on current information and, by postulating the effect of new information, estimate the changes in performance estimates as a result of future program decisions. This provides a means of examining the probable outcome of alternative program decisions without actually carrying out these decisions. The probable results of different program decision paths can then be compared to determine the optimum choice based on current information. The performance-based procedures rely on the implementation of a general performance assessment system to predict site performance. This system or framework must be at least partially in place in order to implement any of the performance-based procedures. Essentially this would involve identification of program requirements, analysis of processes and characteristics that determine compliance with requirements, development of a procedure to assess site characterization and uncertainties, and development of models to estimate performance. Although the framework needs to be defensible and repeatable, it need not include complex and sophisticated models. Rather, the models and procedures should be consistent with the level of available information at any stage in the program. 65 refs., 54 figs., 12 tabs.

35752 **(BMI/ONWI/C—50) Salt Repository Project closeout task report on repository simulation modeling: April 27, 1988.** (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). 27 Apr 1988. Contract AC02-87CH10290. 465p. NTIS, PC A20;3. Order Number DE88011647/JAW.

This report documents the work of the Salt Repository Project in the area of repository simulation modeling at the time of Project termination. It briefly describes the Project's simulation modeling and includes various published and unpublished simulation modeling reports, as appendices. It is important to note that, because of Project termination, some of the material provided in this report has not been subjected to detailed technical review as normally given to published technical documents.

35753 **(BMU—1986-142) Activities of the OECD/NEA, EC and IAEA in the field of radioactive waste treatment.** Mester, W. (Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)). 1986. 188p. (In German). GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.).

Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten.

Whereas the EC and NEA tend to focus on scientific issues in their member states (research and development), the IAEA objectives are orientated more to the needs of the developing countries, i.e. information exchange and development of directly applicable rules and guidelines. The following chapters summarize the tasks and targets of NEA, EC and IAEA in the field of waste treatment and final storage, their major areas of interest, associated working parties and, in as much as possible, future trends. In addition, the German representatives in the various committees and working groups are listed.

35754 **(BMU—1987-155) Investigations on the comparison of toxicity of radioactive wastes with elements in a mine deposit and in filter dust.** Biesold, H.; Haider, G. (Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)). 1987. 27p. (In German). (GRS-A—1309). GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.).

Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten.

For an estimate of the potential danger of a final store for radioactive waste, comparisons with ores containing heavy metals and with filter dust from coal-fired power stations were made based on hazard measurement for radioactive and chemically toxic materials. The results show that the radioactive toxicity of a finally stored fuel element 10^9 years after storage and that of high activity waste several times 10^7 years after final storage is higher than the chemical toxicity of elements which occur in minerals forming sulphide ores. The concentrations and the derived hazard measurements for chemically toxic elements in electrical filter dust are 1-3 orders of magnitude less for the elements examined here than those of ore deposits and are lower in the course of time. Taking into account the filling factor for radioactive waste, as is usual in borehole technique, then the times are reduced to 10^5 and 10^4 years respectively.

35755 **(BMU—1987-157) Investigation of the behaviour of a pillar under rock load and at geothermal temperature with the STEALTH computer program.** Mohiuddin, G. (Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)). Jan 1987. 73p. (In German). (GRS-A—1331). GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.).

Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten.

In this calculation, the behaviour of open hollow spaces in a saltmine (730 m underground) under rock load and at geothermal temperature was examined and a pillar was selected for this. There is a section with a rounded cross section of different size (15 m^2 and 25 m^2) on each side of the pillar. It was assumed that the section is immediately present to the full extent at time t=0; the time effect of section break-out was neglected. The support pressure, i.e. the internal pressure in the section is 10^5 Pa and the geothermal temperature is 37°C. The simulation was done in two different ways. In the first case, the internal pressure was modelled by the so-called pressure boundary conditions, while in the second case,

the section was represented by air-filled mesh. Both calculations showed similar convergence rates. The convergence rates depend on the size of the cross section and on the shape of the section cross section. The convergence rates of the greater section is less than that of the smaller section. The rounded shape of the sections is favourable as regards stress compared with the rectangular section, as no tensile stresses occur in the pillar at any time; there is always security against fracture.

35756 **(BNL-NUREG—40914) The effect of cure conditions on the stability of cement waste forms after immersion in water.** Siskind, B.; Adams, J.W.; Clinton, J.H.; Piciulo, P.L.; McDaniel, K. (Brookhaven National Lab., Upton, NY (USA); Nuclear Regulatory Commission, Washington, DC (USA)). 1988. Contract AC02-76CH00016. 11p. (CONF-880201—35). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007970/JAW.

From Waste management '88: symposium on radioactive waste management; Tucson, AZ, USA (26 Feb 1988).

We investigated the effects of curing conditions on the stability of cement-solidified ion-exchange resins after immersion in water. The test specimens consisted of partially depleted mixed-bed bead resins solidified in one of three vendor-supplied Portland I cement formulations, in a reference cement formulation, or in a gypsum-based binder formulation. We cured samples prepared using each formulation in sealed containers for periods of 7, 14, or 28 days as well as in air or with an accelerated heat cure prior to 90-day immersion in water. Two cement formulations exhibited apparent Portland-cement-like behavior, i.e., compressive strength increased or stabilized with increasing cure time. Two cement formulations exhibited behavior apparently unlike that of Portland cement, i.e., compressive strength decreased with increasing cure time. Such non-Portland-cement-like behavior is correlated with higher waste loadings. The gypsum-based formulation exhibited approximately constant compressive strength with cure time. Accelerated heat cures may not give compressive strengths representative of real-time cures. Some physical deterioration (cracking, spalling) of the waste form occurs during immersion.

35757 **(BNL-NUREG—40927) Characterization of low-level waste from the industrial sector, and near-term projection of waste volumes and types.** MacKenzie, D.R. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 11p. (CONF-880201—36). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007969/JAW.

From Waste management '88: symposium on radioactive waste management; Tucson, AZ, USA (26 Feb 1988).

A telephone survey of low-level waste generators has been carried out in order to make useful estimates of the volume and nature of the waste which the generators will be shipping for disposal when the compacts and states begin operating new disposal facilities. Emphasis of the survey was on the industrial sector, since there has been little information available on characteristics of industrial LLW. Ten large industrial generators shipping to Richland, ten shipping to Barnwell, and two whose wastes had previously been characterized by BNL were contacted. The waste volume shipped by these generators accounted for about two-thirds to three-quarters of the total industrial volume. Results are given in terms of the categories of LLW represented and of the chemical characteristics of the different wastes. Estimates by the respondents of their near-term waste volume projections are presented.

35758 **(CEA-DAS—435) α and long-lived $\beta\gamma$ waste source term. A first generation model for a deep cemented waste repository.** Lovera, P.; Mangin, J.P.; Jorda, M.; Lewi, J. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete). 1987. 12p. (CONF-8711194—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753473/JAW.

From NEA seminar on evaluation of source term modelling for waste storage; Baden, Switzerland (23 Nov 1987).

According to the normal scenario of radioactivity release to the biosphere, only long-lived nuclides are able to migrate significantly to the surface. A first generation model, concerning a cemented waste of hulls and ends deeply disposed of in a granitic medium is in progress at CEA. Two nuclides have been selected: 237-Neptunium (as a reference of α emitters) and 135-Cesium (as a reference of long-lived β emitters). Attributing the long term activity to these both nuclides leads to a model which is conservative beyond ca. 150000 years. Principal difficulties arise from physico-chemical behaviour of Neptunium in aqueous phase, and from non-linear Cesium adsorption on various media. Condiment code (versions 2 and 3), which is developed parallely to the present model is conceived to take account for these phenomena.

35759 **(CONF-871102—3) Applications of a standard leaching test for waste forms.** Godbee, H.W.; Anders, O.U. (Oak Ridge National Lab., TN (USA); Dow Chemical U.S.A., Midland, MI). 1987. Contract AC05-84OR21400. 7p. (CONF-871102—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008665/JAW.

From International waste management conference; Kowloon, China (29 Nov 1987).

The American National Standard, "Measurement of the Leachability of Solidified Low-Level Radioactive Wastes by a Short-Term Procedure," ANSI/ANS-16.1-1986, provides a uniform procedure to measure and index the release of nuclides from waste forms as a result of leaching. It provides a mathematical procedure for calculating a "Leachability Index" value from the test data. The merits and demerits of the procedure, based on several years of usage, are discussed. The results obtained for waste forms by this procedure are compared with the results obtained on specimens of the same waste form using the MCC-1 test protocol of the Materials Characterization Center of the US Department of Energy. 5 refs., 1 fig., 2 tabs.

35760 **(CONF-880377—3) Analysis of corrosion data for carbon steels in simulated salt repository brines and acid chloride solutions at high temperatures.** Diercks, D.R.; Hull, A.B.; Kassner, T.F. (Argonne National Lab., IL (USA)). Mar 1988. Contract W-31-109-ENG-38. 27p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88012030/JAW.

From Joint U.S. DOE/FRG workshop on nuclear package materials; Albuquerque, NM, USA (9 Mar 1988).

Carbon steel is currently the leading candidate material for fabrication of a container for isolation of high level nuclear waste in a salt repository. Since brine entrapped in the bedded salt can migrate to the container by several transport processes, corrosion is an important consideration in the long-term performance of the waste package. A detailed literature search was performed to compile relevant corrosion data for carbon steels in anoxic acid chloride solutions, and simulated salt repository brines at temperatures between ~ 20 and 400°C. The hydrolysis of Mg^{2+} ions in simulated repository brines containing high magnesium concentrations causes acidification at temperatures above 25°C, which, in turn, influences the protective nature of the magnetite corrosion product layer on carbon steel. The corrosion data for the steels were analyzed, and an analytical model for general corrosion was developed to calculate the amount of penetration (i.e., wall thinning) as a function of time, temperature, and the pressure of corrosion product hydrogen than can build up during exposure in a closed system (e.g., a sealed capsule). Both the temperature and pressure dependence of the corrosion rate of steels in anoxic acid chloride solutions indicate that the rate-controlling partial reaction is the cathodic reduction of water to form hydrogen. Variations in the composition and microstructure of the steels or the concentration of the ionic species in the chloride solutions (provided that they do not change the pH significantly) do not appear to strongly influence the corrosion rate.

35761 **(CONF-880601—30) Assessment of seismic hazards at Yucca Mountain.** King, J.L.; Frazier, G.A.; Grant, T.A. (Science Applications International Corp., Las Vegas, NV (USA)). 1988. Contract AC08-87NV10576. 5p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88009010/JAW.

From American Nuclear Society annual meeting; San Diego, CA, USA (12 Jun 1988).

During the preclosure time period (approximately 100 yr), the prospective geologic repository at Yucca Mountain must provide for public and worker radiological safety and retrievability of emplaced waste. During the postclosure period (10,000 yr), the re-

pository must ensure that cumulative radionulclide releases to the accessible environment comply with EPA release limits. Substantially complete containment must be provided by the waste packages for 300-1000 yr. All of these functions must be maintained should a severe seismic event occur and must be achieved with reasonably available technology. The seismic phenomena of interest for the preclosure period are vibratory ground motion from a nearby earthquake or underground nuclear explosion (UNE), faulting beneath surface facilities that are important to safety, and faulting in underground areas of emplaced waste. For the postclosure period, earthquake ground motion, underground faulting, and seismically induced adverse changes in hydrologic conditions have been identified as the most important seismic phenomena to be characterized. The NNWSI Project Site Charcterization Plan describes a number of seismic parameters that are needed for repository design or performance assessment, along with tentative goals for each parameter. Key parameters, goals and current assessments, all subject to change as site characterization progresses, are summarized in this report. 4 refs.

35762 (CONF-880652—1) Hydrogeologic characterization activities on the Oak Ridge Reservation, Tennessee, in support of waste management studies in a humid environment. Stow, S.H.; Huff, D.D.; Haase, C.S.; Ketelle, R.H. (Oak Ridge National Lab., TN (USA); Jordan (E.C.) Co., Oak Ridge, TN (USA)). 1988. Contract AC05-84OR21400. 10p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011006/JAW.

From International symposium on hydrogeology and safety of radioactive and industrial hazardous waste disposal; Orleans, France (7 Jun 1988).

Extensive geohydrologic characterization work is under way on the Oak Ridge Reservation in East Tennessee. This site is extremely complex geologically and hydrologically and lies in an area of significant rainfall. Recent regulatory requirements pertaining to protection of groundwater and to the management of radioactive and hazardous wastes, which have been disposed of on the Reservation for 45 years, are the primary reason for this extensive characterization. 4 refs., 3 figs.

35763 (CONF-880741—3) Low-level radioactive waste disposal at a humid site. Lee, D.W. (Oak Ridge National Lab., TN (USA)). Mar 1987. Contract AC05-84OR21400. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88007478/JAW.

From Joint CSCE-ASCE conference on environmental engineering; Vancouver, Canada (13 Jul 1988).

Waste management in humid environments poses a continuing challenge because of the potential contamination of groundwater in the long term. Short-term needs for waste disposal, regulatory uncertainty, and unique site and waste characteristics have led to the development of a site-specific waste classification and management system proposed for the Oak Ridge Reservation. The overlying principle of protection of public health and safety is used to define waste classes compatible with generated waste types, disposal sites and technologies, and treatment technologies. 1 fig., 1 tab.

35764 (CONF-8806148—1) Characterization of solid low-level radioactive waste at the Oak Ridge National Laboratory. Van Cleve, J.E. Jr. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011383/JAW.

From French National Waste Management Agency (ANDRA) meeting; Paris, France (6 Jun 1988).

This paper describes the current methods used to characterize solid low-level radioactive waste at the Oak Ridge National Laboratory. Two systems are described: one based on the isotopic content of the waste and the second on the radiation exposure rate at the waste package surface. The latter system was implemented in mid-1986 as a result of greater emphasis on limiting personnel radiation exposure.

35765 (DOE/EA—0078) Environmental impact assessment of the former airport storage site of the Atomic Energy Commission, St. Louis County, Missouri. (Oak Ridge National Lab., TN (USA)). Jul 1979. Contract AC05-84OR21400. 161p. NTIS, PC A08;3. Order Number DE88008857/JAW.

The primary purpose of this Environmental Assessment is to evaluate the adequacy of the Quit-Claim Deed, used to protect public health, safety and environmental quality. The assessment evaluates two proposed actions: (1) the use of this deed to control present radiation exposure from the site, and (2) the use of the deed to control anticipated radiation exposure from the site after the burial of approximately 18,300 to 50,000 yd^3 of contaminated material from a former AECNRC licensed site (the Latty Avenue site) located about 34 mile northeast of the airport storage site. Four alternatives to the proposed actions are also evaluated: (1) complete site decontamination with removal of radioactive material to an unidentified location; (2) release of the site for {open←quotes}unrestricted use{close←quotes} with no further action; (3) release of the site for {open←quotes}unrestricted use{close←quotes} after burial of contaminated material from the Latty Avenue site; and (4) continued restriction of the site with no development of the site permitted.

35766 (DOE/HWP—40) A review of state regulations that exceed those of the federal Resource Conservation and Recovery Act (RCRA). Coutant, C.C.; Heckman, C.L. (Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OR21400. 187p. NTIS, PC A09/MF A01;1; GPO Dep. Order Number DE88010750/JAW.

This report identifies and provides information on state hazardous waste management programs and regulations in states where the US Department of Energy (DOE) has facilities. The objective is to describe for the DOE defense program and its contractors how state requirements are more stringent than the federal regulations under the Resource Conservation and Recovery Act (RCRA). DOE defense programs are located in 13 of the 50 states. Most of these states have regulations that are essentially equivalent to the federal RCRA requirements as they existed prior to the 1984 amendments, but their regulations are, in most instances, more stringment than the federal requirements. Differences are both substantive and procedural, and they are summarized and tabulated herein. All but three of these 13 states have been granted Final Authorization from the US Environmental Protection Agency (EPA) to operate their own hazardous waste management program in accord with the federal RCRA program prior to the 1984 amendments; two of the three others have some stage of Interim Authorization. EPA currently administers all of the provisions of the 1984 amendments, including requirements for corrective action under Sect. 3004(u). Two states, Colorado and Tennessee, have been granted revisions to their Final Authorizations delegating responsibility for the hazardous wastes. Responsible state agencies (with appropriate telephone numbers) are indicated, as are the relevant laws and current regulatory statutes.

35767 (DOE/ID/12476—T3) Assessment of the requirements for DOE's annual report to congress on low-level radioactive waste. (Inter/Face Associates (USA)). Oct 1987. Contract FG07-83ID12476. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011143/JAW.

The Low-level Radioactive Waste Policy Amendments Act of 1985 (PL99-240; LLRWPAA) requires the Department of Energy (DOE) to "submit to Congress on an annual basis a report which: (1) summarizes the progress of low-level waste disposal siting and licensing activities within each compact region, (2) reviews the available volume reduction technologies, their applications, effectiveness, and costs on a per unit volume basis, (3) reviews interim storage facility requirements, costs, and usage, (4) summarizes transportation requirements for such wastes on an inter- and intra-regional basis, (5) summarizes the data on the total amount of low-level waste shipped for disposal on a yearly basis, the proportion of such wastes subjected to volume reduction, the average volume reduction attained,, and the proportion of wastes stored on an interim basis, and (6) projects the interim storage and final disposal volume requirements anticipated for the following year, on a regional basis (Sec. 7(b))." This report reviews and as-

sesses what is required for development of the annual report specified in the LLRWPAA. This report addresses each of the subject areas set out in the LLRWPAA.

35768 **(DOE/ID/12576—T5) Plans for dealing with loss of access to the Midwest compact regional disposal facility: Regional management plan.** Sutherland, A.A. (Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)). 28 Jul 1986. Contract FG07-85ID12576. 37p. (RAE—8503/3-2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008158/JAW.

A sudden and unexpected cessation of operations at the Midwest Compact's regional disposal facility could have dire consequences for the hospitals, universities and industries that generate low-level waste. To avoid interrupting important activities at these institutions, the Compact Commission must review alternatives available for managing low-level waste should the Midwest disposal facility become unavailable. Section 2 describes events that could lead to the premature closure of a disposal facility and the prospects that the closed facility could eventually be reopened. Section 3 discusses possible courses of action leading to disposal outside the Midwest region while the Midwest Compact works to reestablish a regional disposal capability. Section 4 presents a likely division of responsibilities between the Compact Commission and the individual member states, with emphasis on managing low-level waste after a loss of access when disposal outside the Midwest is not possible. Section 5 describes key elements in an agreement between compacts to accept each other's waste when one compact has experienced an unexpected interruption of its disposal operation. Section 6 summarizes key points of the report. 4 refs.

35769 **(DOE/ID/12576—T10) Host state incentives and compensation:.** Schneider, P. (ERM-McGlennon Associates, Boston, MA (USA)). 30 Jun 1986. Contract FG07-85ID12576. 37p. NTIS, PC A03;3. Order Number DE88008152/JAW.

After reviewing several options for selecting a host state, the Commission elected to proceed with anoption that builds upon developing grass-roots acceptance and support. To foster such support the Commission has adopted an incentives and compensation package. The purpose of the package is thnt the incentives and compensations offered are designed to encourage an objective and unbiased review of accepting the responsibilities of a host state or community, and the package helps to guarantee that a facility will become a state/community asset and not impose economic, environmenta, or social hardships for the host community. This report, which describes the Commission's host state incentive and compensation package, the monetary benefit to the host community and state will be substantial. Community benefits will exceed $40 million over 20 years and benefits to the state will be approximately $24 million over the 20-year expected life of the facility. 10 refs., 4 tabs.

35770 **(DOE/ID/12584—24) Environmental monitoring report on the US Department of Energy's Grand Junction Projects Office facility, Grand Junction, Colorado, for calendar year 1987.** (UNC Geotech, Grand Junction, CO (USA)). May 1988. Contract AC07-86ID12584. 4p. (UNC/GJ-HMWP—5). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011469/JAW.

This report presents results of environmental monitoring activities conducted in 1987 at the US Department of Energy's (DOE) Grand Junction Projects Office (GJPO) Facility in Colorado. The site is included under the DOE's Defense Decontamination and Decommissioning (Defense D & D) Program.

35771 **(DOE/ID/12640—T1) Operational experience with selective ion-exchange media in sluiceable pressurized demineralizers at nuclear power plants: Final draft.** (Analytical Resources, Inc., Wyomissing, PA (USA)). 6 May 1987. Contract FG07-86ID12640. 46p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number TI88008554/JAW.

DURASIL selective ion-exchange media has been successfully used in processing liquid radioactive waste at several nuclear power plants. Processing at three (3) of these plants indicates that when selective ion-exchange DURASIL media replace non-selective organic ion-exchange resins, greater throughputs, substantial radwaste volume reduction, personnel exposure reduction, operator man-hour reductions, reduced effluent releases, and higher processing decontamination factors (DF) can be expected. Very little data was available on operator related matters (e.g., operator requirements, radiation exposure, etc.) or on the economics of the system. However it is known that DURASIL media has an average cost that is about 7-8 times that of organic ion exchange resins. Despite the lack of detailed cost data, there is an overall economic advantage with DURASIL media over organic resins: Effective ion exchange capacity is 5-10 times greater; only radioactive ion species are captured while other non-radioactive ions pass through; the DF for typical radioactive species is 5-15 times higher; and the process rate is 2-5 times faster. Power plants which are processing liquid waste streams with Duratek's products indicate that they are experiencing: Higher volumetric throughputs; increased liquid processing flowrates; reduced radioactivity DFs; reduced radioactive waste volumes required disposal; reduced operator time; and lower personal radiation exposure. 8 figs., 16 tabs.

35772 **(DOE/NE/44352—T3) Massachusetts' participation in the US Department of Energy's Crystalline Repository Project: Final report.** Dukakis, M.S.; Johnston, P.W.; Walker, B. Jr. (Massachusetts Dept. of Public Health, Boston (USA)). Dec 1986. Contract FG02-83NE44352. 180p. NTIS, PC A09;3. Order Number DE88008003/JAW.

The purpose of this report is to review activities of the Crystalline Rock Project (CRP) in Massachusetts, the context in which it arose, and the implications and possibilities of future federal policy decisions on the siting of a HLW repository in a crystalline rock body. Although Massachusetts has been eliminated from consideration, there are still issues of concern to be resolved regarding the potential impacts upon Massachusetts if a site were ever to be chosen in New England.

35773 **(DOE/OR/00033—T401) Managing the uncertainty in the radiological assessment component of repository performance assessment.** Massey, C.D. (Oak Ridge Associated Universities, Inc., TN (USA); Pittsburgh Univ., PA (USA)). 1988. Contract AC05-76OR00033. 232p. University of Pittsburgh, 4200 Fifth Avenue, Pittsburgh, PA 15260. Order Number TI88008617/JAW.

The purpose of this study was to develop an approach for performing sensitivity and uncertainty analyses; to develop an efficient method for determining research effort focus; and to provide a framework for approaching analyses of complex environmental assessment models. The approach developed for managing the uncertainty in repository performance assessments was called the M- and U-Significance Approach (MUSA). MUSA was developed as part of this study using a generic radiological assessment code named MUST. The MUST code was developed using mathematical equations used by the Nuclear Regulatory Commission (NRC) and the Environmental Protection Agency (EPA). MUST was verified using results generated by the EPA for use in setting EPA's high-level radioactive waste standards. Since MUST is a probabilistic code, a comparison of its predictions with the predictions of the EPA's deterministic code was used to illustrate the usefulness of probabilistic assessments and demonstrates the process of showing reasonable compliance with regulatory standards. 359 refs., 19 figs., 5 tabs.

35774 **(DOE/RL/11388—T1) Bureau of Mines review of Department of Energy report {open←quotes}Exploratory shaft design basis study review{close←quotes}: Final technical report.** (Bureau of Mines, Pittsburgh, PA (USA). Pittsburgh Research Center). [1987]. Contract AI06-87RL11388. 35p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011608/JAW.

The Basalt Waste Isolation Project (BWIP) is an investigative program being conducted by the US Department of Energy to determine the feasibility of locating a nuclear waste repository in the deep basalts beneath the Hanford Site in south-central Washington. As part of the site characterization phase of the program, an Exploratory Shaft Facility (ESF) will be constructed to conduct in situ testing for site characterization and feasibility. The Bureau of

Mines has been solicited by DOE, through an Interagency Agreement, to review the subject report as an independent reviewer. The review of this report covers three general areas: hydrology, ventilation, and shaft sinking and excavation. The hydrology section evaluates water inflow parameters and quantities and the water inflow range. The ventilation section evaluates underground ventilation air quantities; methane inflow parameters and quantities; gassy mine cost impacts; shaft ventilation and conveyance velocity criteria; and methane release rate. The shaft sinking and excavation section evaluates the second shaft cost estimate and hoisting; underground development schedule; and underground drifting. 8 refs.

35775 **(DOE-RW—87.108) Release mechanisms from shallow engineered trenches used as repositories for radioactive wastes.** Locke, J.; Wood, E. (National Nuclear Corp. Ltd., London (UK)). (Department of the Environment, London (UK); National Nuclear Corp. Ltd., London (UK)). May 1987. 94p. (NNC—1096). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753985/JAW.

This report has been written for the Department of the Environment as part of their radioactive waste management research programme. The aim has been to identify release mechanisms of radioactivity from fully engineered trenches of the LAND 2 type and, to identify the data needed for their assessment. No direct experimental work has been involved. The report starts with a brief background to UK strategy and outlines a basic disposal system. It gives reviews of existing experience of low level radioactive waste disposal from LAND 1 trenches and of UK experience of toxic waste disposal to provide a practical basis for the next section which covers the implications of identified release mechanisms on the design requirements for an engineered trench. From these design requirements and their interaction with potential site conditions (both saturated and unsaturated zone sites are considered) an assessment of radionuclide release mechanism is made.

35776 **(DOE-RW—88.001) Origin, composition and distribution of 'hot particles' derived from the nuclear industry and dispersed in the environment.** Hamilton, E.I.; Clifton, R.J. (Department of the Environment, London (UK)). Oct 1987. 109p. NTIS (US Sales Only), PC A06/MF A01. Order Number DE88753511/JAW.

Today, recent sediments of the Esk estuary, Cumbria, contain few hot particles derived from BNF compared with those deposited during peak releases of 1972-1974. Overall the hot particles account for about 10% of the total alpha particle activity of the sediments. At some horizons, in buried sediments, concentrations of hot particles probably represent rapid transport on the sea surface under conditions of minimum erosion. Similar particles, usually less well defined, occur in accreting sediments but are corroded. Representative types of the most radioactive particles have been isolated and contain Pu, Am and Cm but only trace amounts of naturally occuring alpha emitters. Microprobe analysis of these particles often shows the presence of fairly pure uranium as the major element. On the basis of radioactivity and elemental composition many of these particles appear to be irradiated nuclear fuel debris.

35777 **(DOE-RW—88.020) Immobilization of radioactive waste in cement based matrices.** Glasser, F.P.; Macphee, D.; Atkins, M.; Beckley, N.; Carson, S.; McHugh, G.; Mattingley, N.J.; Naish, C.C.; Wilding, C.R. (Department of the Environment, London (UK)). 1988. 106p. NTIS (US Sales Only), PC A06/MF A01. Order Number DE88753608/JAW.

The modelling of cement behaviour at longer ages is reported. Factors studied include composition, pH and Esub(h). The stresses arising from irradiation are evaluated. The behaviour of two elements in cement - U and I has been studied; new experimental data are reported including solubility measurements. Some additional data are given on Sr. Results of desk studies relevant to lifetime predictions are presented.

35778 **(DOE-RW—88.023) Flammable gas production in Land 2 and Land 3/4 radioactive waste repositories.** (Department of the Environment, London (UK)). Feb 1988. 110p. NTIS (US Sales Only), PC A06/MF A01. Order Number DE88753513/JAW.

Geological, radiolytic and microbiological sources of gas are considered in relation to Land 2 and Land 3/4 type radioactive waste repositories. Geological sources are potentially the most troublesome and it is concluded that site investigation work should be designed to detect gas trap structures, reservoir lithologies or source rocks. Known source and reservoir lithologies should not be considered as suitable for the siting of waste repositories. Radiolytic and microbiological sources will depend on waste characteristics. A detailed review of the literature on radiolytic gas generation is presented and conclusions from this work indicate that water in waste and matrix should be kept to a minimum. Similarly, the level of radioactivity stored in each waste container should be kept to the minimum compatible with the storage design. Microbiological gas sources will be reduced by maintaining the cellulose content of the waste at a minimum. It is suggested that the removal of organics from the waste stream would be beneficial in terms of potential gas production.

35779 **(DOE-RW—88.047) Sensitivity studies on TIME2 Version 1.0.** (Department of the Environment, London (UK); Dames and Moore, London (UK)). Mar 1988. 39p. (DM-TR—11). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753989/JAW.

The results of a sensitivity analysis of Version 1.0 of the TIME2 computer code to certain aspects of the input data set are presented. Parameters evaluated were: river dimensions, the density and grain size of sediment carried by the river, human intrusion data, sea level rise rate, erosion factors and meander modelling data. The sensitivity of the code to variation of single value parameters was evaluated by means of graphical comparisons. For parameters specified as probability density functions (pdf's), the Kolmogorov-Smirnov test was used. The study assists in the specification of data for TIME2 by identifying parameters to which the models used are particularly sensitive and also suggests that some input currently specified as pdf's could be replaced with single values without affecting the quality of the results obtained.

35780 **(DOE/RW—0160-Vol.3) Site characterization plan: Yucca Mountain site, Nevada research and development area, Nevada: Consultation draft, Nuclear Waste Policy Act.** (Department of Energy, Washington, DC (USA). Office of Nuclear Waste Management). Jan 1988. Contract AC08-87NV10576. 638p. H. Order Number TI88007744/JAW.

Chapter six describes the basis for facility design, the completed facility conceptual design, the completed analytical work relating to the resolution of design issues, and future design-related work. The basis for design and the conceptual design information presented in this chapter meet the requiremenrs of the Nuclear Waste Policy Act of 1982, for a conceptual repository design that takes into account site-specific requirements. This information is presented to permit a critical evaluation of planned site characterization activities. Chapter seven describes waste package components, emplacement environment, design, and status of research and development that support the Nevada Nuclear Waste Storage Investigation (NNWSI) Project. The site characterization plan (SCP) discussion of waste package components is contained entirely within this chapter. The discussion of emplacement environment in this chapter is limited to considerations of the environment that influence, or which may influence, if perturbed, the waste packages and their performance (particularly hydrogeology, geochemistry, and borehole stability). The basis for conceptual waste package design as well as a description of the design is included in this chapter. The complete design will be reported in the advanced conceptual design (ACD) report and is not duplicated in the SCP. 367 refs., 173 figs., 68 tabs.

35781 **(DP—86-125-1/2) Waste management program: Technical progress report, January-June 1986.** (BE, Inc., Barnwell, SC (USA)). Mar 1988. Contract AC09-76SR00001. 24p. (BEI/SRL—8655-1/86). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010335/JAW.

This report provides information on operations and development programs relating to the management of radioactive wastes at the Savannah River Plant. Information on environmental and safety

assessments, waste form development, and process and equipment development are reported for long-term waste management.

35782 **(DP-MS—87-118) Metal toxicity evaluation of Savannah River Plant saltstone comparison of EP and TCLP test results.** Langton, C.A. (Savannah River Lab., Aiken, SC (USA)). 1988. Contract AC09-76SR00001. 12p. (CONF-880201—37). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008213/JAW.

From Waste management '88: symposium on radioactive waste management; Tucson, AZ, USA (26 Feb 1988).

Saltstone is the waste treatment and disposal concept for low-level defense waste at the Savannah River Plant. The waste is a sodium salt solution which has about 230 μCiL in addition to the hazardous characteristics of corrosivity and metal toxicity (Cr^{+6} > 100 ppM). Two EPA test procedures are routinely used at SRP to evaluate metal toxicity of wastes and wasteforms. 1) the Extraction Procedure (EP); and 2) the Toxicity Characterization Leaching Procedure (TCLP). The EP test is required by SCDHEC and EPA. The TCLP is used to evaluate the effect of increased surface area on metal leaching from the various SRP wasteforms. EP and TCLP test results are presented for two types of wasteforms, a cement-based saltstone and for a slag-based saltstone. The slag saltstone chemically stabilizes and also physically entraps the chromium. For waste solutions with low to intermediate metal concentrations (up to 5000 ppM), the TCLP extracts typically have lower metal values than the EP extracts. This is attributed to the faster neutralization of the acetic acid by the crushed TCLP sample. Crushing increases surface area and consequently releases more alkalinity from the wasteform matrix and the wasteform pore solution. Metal concentrations in the EP and TCLP extracts are proportional to the concentrations of metals in the pore solution for both the cement or slag-based wasteforms. The pore solution concentrations for cement wasteforms are directly related to the soluble metal concentration in the waste. The metal concentration in the slag wasteform pore solutions are significantly lower than the waste because these metals are reduced lower valences and precipitated as insoluble solid phases. 3 refs., 3 figs., 5 tabs.

35783 **(DP-MS—87-153) Immobilization of incinerator ash in a concrete matrix.** Simpson, R.S.; Charlesworth, D.L. (Savannah River Lab., Aiken, SC (USA)). 1988. Contract AC09-76SR00001. 12p. (CONF-880526—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008217/JAW.

From International conference on incineration of hazardous and radioactive waste; San Francisco, CA, USA (3 May 1988).

The ashcrete process will solidfy ash generated by the consolidated Incinerator Facility (CIF) at the Savannah River Plant (SRP). The ashcrete unit produces ashcrete, a stable cement-based wasteform, by remotely adding cement and water and tumbling drums of ash. Ashcrete product homogeneity, temperature rise during setting, and compressive strength were measured and product formulations were developed for several nonradioactive dry ash types. Saturation level and wet and dry ash densities for several ash types have been measured. Preliminary mixture formulations for the anticipated ash were tested. A proof-of-principle test was performed using a mockup of the CIF ash system. Finally, mechanical modifications to prepare the unit for use with the CIF and to ensure reliable operation are being implemented. 4 refs., 5 figs., 5 tabs.

35784 **(DP-MS—88-76) DWPF [Defense Waste Processing Facility] glass composition control based on glass properties.** Carter, J.T.; Brown, K.G.; Bickford, D.F. (Savannah River Lab., Aiken, SC (USA)). 1988. Contract AC09-76SR00001. 9p. (CONF-8806111—3). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010894/JAW.

From Conference on the advances in fusion of glass; Alfred, NY, USA (14 Jun 1988).

The Defense Waste Processing Facility (DWPF) will immobilize Savannah River Plant (SRP) High Level Waste as a durable borosilicate glass for permanent disposal in a civilian repository. The DWPF will be controlled based on glass composition. The waste glass physical and chemical properties, such as viscosity, liquidus temperature, and durability are functions of glass chemistry. Preliminary models have been developed to evaluate the effects of feed composition variability on the glass properties. These properties are presently being related to the waste glass composition in order to develop process control paradigms that include batching algorithms, hold points, and transfer limits. 3 refs., 6 tabs.

35785 **(DP-MS—88-79) Advances in processing nuclear waste glasses.** Plodinec, M.J. (Savannah River Lab., Aiken, SC (USA)). 1988. Contract AC09-76SR00001. 12p. (CONF-8806111—5). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011209/JAW.

From Conference on the advances in fusion of glass; Alfred, NY, USA (14 Jun 1988).

The vitrification of nuclear waste glasses is presenting unique challenges to glass technologists. On the one hand, the composition of the most important constituent of the glass batch{–}the waste{–}may vary widely. On the other hand, the vitrification process itself must be tightly controlled to ensure product quality, public safety, and process reliability. This has led to several important developments in waste vitrification technology, all aimed at improving process control. These include use of process models, use of artificial intelligence techniques, and improved control and measurement of glass redox. 19 refs., 2 figs., 2 tabs.

35786 **(DPST—86-219) Experimental canister frit blaster : Final report.** Ward, C.R. (Savannah River Lab., Aiken, SC (USA). Technical Div.). 9 Jan 1986. Contract AC09-76SR00001. 41p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011270/JAW.

The testing program for the Experimental Canister Frit Blaster (ECFB) has been sucessful in meeting all of the major objectives. Testing of the ECFB has demonstrated that the basic design concepts were valid; frit suspension in the blasting chamber sump by recirculation; blasting by canister manipulation in front of stationary nozzles; grapple operation in an abrasive frit environment. Many design improvements were identified during the testing. These improvements were incorporated in the design of the DWPF Canister Decontamination Chamber (CDC), avoiding costly and time consuming modifications to the CDC after fabrication. The required process parameters to adequately clean all areas of the canister with a minimum amount of frit and water were determined. Testing with full scale equipment has allowed required consumption of frit and water to be significantly reduced from the previous assumptions. The optimum sequence of operation for slurry blasting, rinsing and drying the canister was determined. The sequence of operation developed for the CDC is very complex and has 104 steps. Developing the sequence of operation for the CDC would have been extremely difficult without the experience gained from the operation of the ECFB. The ECFB testing program has been completed and the ECFB has been shutdown. 4 refs., 14 figs., 6 tabs.

35787 **(DPST—86-714) Sampling strategy for the DWPF.** Postles, R.L. (Savannah River Lab., Aiken, SC (USA)). 9 Oct 1986. Contract AC09-76SR00001. 11p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009572/JAW.

Since both upstream (feed & process) and downstream (product sampling & assay) indicators are informative, some combiantion of the two will be more informative than either alone (if both are accurate). A "Kalman Filter" is a "Bayesian" combination of the two which seems to me particularly appropriate for your purposes. The Kalman Filter estimate of the leach-rate would be a linear combination of your upstream projection "P" and the pertinent downstream in-canister measurement "M" (if there is one for that canister). The projection would be "up-dated" by the measurement to an extent determined by their difference and the relative uncertainties in each; viz: [Kalman Estimate] = P + K(M-P) $0 \leq K \leq 1$. The two extremes which bound options are: to project only (K=O), or to measure only (K=1). An intermediate position, a value K{ne}O,1 commensurate with the relative merits of upstream projection vis-a-vis the essential difficulty of characterizing the in-canister waste product, should be your goal. A promising position may be to project upstream knowledge "strongly" while yet relying on some product sampling for verification.

35788 **(DPST—88-386) FB-Line shredding tests.** Meyer, M.I. (Savannah River Lab., Aiken, SC (USA)). 12 Apr 1988. Contract AC09-76SR00001. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011269/JAW.

In support of the planned upgrade of FB-Line, IWTD performed shredding tests on 10 different potential waste materials that can be found in the gloveboxes. Over 200 pounds of material were shredded in approximately 16 hours. Bulk densities of the material ranged from 1.6 to 66 lbft^3; chemwipes and HOMALITE support rings were the lower and upper density materials, respectively. Shredding times ranged from 0.2 to 5.7 minutes with polyvinylchloride bags taking the longest shred time. A maximum volume reduction ratio of 6.9:1 was attained upon shredding HOMALITE glove support rings. Polypropylene spun filters and polyethylene bottles expanded upon shredding with a volume increase of 70 and 40 percent, respectively. Absorbancy tests indicated a single chemwipe can absorb 5.5 and upon squeezing, retain 2.5 times its weight in water. 2 tabs.

35789 **(DPST—88-494) SRL in-situ tests in the United Kingdom: Part 1, program document and sample emplacements.** Wicks, G.; Jantzen, c.; Plodinec, J. (Savannah River Lab., Aiken, SC (USA)). 14 Apr 1988. Contract AC09-76SR00001. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011674/JAW.

The primary objective of the high-level waste management program at the Savannah River Plant (SRP) is to safely and effectively immobilize high-level radioactive defense waste into borosilicate glass. By federal law this glass will ultimately be disposed of in a deep, geologic repository. Thus, it is necessary to demonstrate that the waste glass will perform well in the geologic environment. A multiphase experimental effort, directed at assessing and understanding waste glass behavior under repository conditions, has been in progress at Savannah River Laboratory (SRL) for approximately seven years. Emphasized in this program are waste glass and repoeitory relevant interactions both on a laboratory scale and in field tests. The field or in-situ experiments are exemplified by the burial of over 100 simulated SRL waste glass samples in the granite site at Stripa in Sweden; field tests involving burial of simulated SRL waste glasses in clay at Mol, Belgium; in-situ testing of simulated waste forms from seven different countries and almost 2000 waste form and package component samples buried at the WIPP salt site at Carlsbad, NM; and the burial of SRL waste glasses and natural glass analogues in limestone at Ballidon in the United Kingdom. It is the objective of this report to describe the new SRL in-situ program conducted in the UK. 33 refs., 5 figs., 4 tabs.

35790 **(DPST—88-560) Evaluation of waste tank 16 using a field mercury analyzer.** Looney, B.; Cook, J.R. (Savannah River Lab., Aiken, SC (USA)). 12 May 1988. Contract AC09-76SR00001. 8p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011673/JAW.

Liquid radioactive wastes from the chemical processing of nuclear materials at the Savannah River Plant (SRP) are stored in large tanks buried near the ground surface. Each tank has multiple containment barriers designed to prevent leakage to the surrounding soil and groundwater. The only incident in which waste leaked through the multiple containment of a waste tank at SRP occurred at Tank 16 on September 8, 1960 (Poe, 1974; Prendergast, 1982). Tank 16 was built in 1955 and has a capacity of approximately one million gallons. Tank 16 consists of a steel primary containment vessel resting in a shallow steel pan. A massive concrete encasement surrounds the tank and pan. After the leak in 1960, the tank was removed from service until 1967; at that time it was placed into service for lower activity wastes. In 1972 the tank was removed from service. Subsequently, all of the waste except a sludge heel of 67,000 gallons was removed from the tank. In 1980, this sludge was removed. Following the sludge removal, the tank was exhaustively cleaned and rinsed. Concentrations of radioactivity in the rinsewater suggested that the cleaning of the tank was effective (West and Morris, 1980). Recently, there has been concern about residual nonradioactive constituents, such as mercury, in the tank. To assist in evaluating the potential for residual mercury contamination, a survey method was developed and a survey of several tanks was conducted. 3 refs., 1 tab.

35791 **(EGG-M—34287) State development of new low-level radioactive waste disposal capacity: Progress and issues.** Tait, T.D. (EG and G Idaho, Inc., Idaho Falls (USA)). 1987. Contract AC07-76ID01570. 17p. (CONF-871076—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88006768/JAW.

From 14. World Nuclear Fuel Market annual meeting and international conference on nuclear fuel; San Diego, CA, USA (18 Oct 1987).

The US Department of Energy (DOE) Low-Level Waste Management Program (LLWMP) under the Assistant Secretary for Nuclear Energy (NE) was established in 1981 to facilities the developement and implemenation of an effective nationwide system for the management of commercially generated low-level radioactive waste (LLW). The Low-Level Radioactive Waste Policy Amendments Act (LLRWPAA of 1985) assigned several responsibilites to DOE, including providing tehnical assistance to compact regions, host states, and nonmember states to the extent provided in appropriations acts; and reporting to Congress annually on the status of national LLW management activities and the progress being made by compact regions and states to site new disposal facilities. EG & G Idaho, Inc. is the lead contractor responsible for managing, planning, and conducting assigned tasks in support of the NE LLWMP within the guidelines provided by DOE. 2 figs., 4 tabs.

35792 **(EGG-M—88044) Instrumentation and control for resource management at the INEL.** Polk, R.E. (EG and G Idaho, Inc., Idaho Falls (USA)). 1988. Contract AC07-76ID01570. 5p. (CONF-8804106—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88007709/JAW.

From Pacific Cascade '88; Eugene, OR, USA (26 Apr 1988).

Resource management at facilities dealing with nuclear reactors and waste processing includes the conservation of storage space, reduction of radiation exposure, and improvement of operational efficiency. The application of current control and display technology is a significant asset in the performance improvement of these facilities. Four examples of such applications at the Idaho National Engineering Laboratory (INEL) are presented.

35793 **(EUR—11031) Safety studies of HLW-disposal in the Mors salt dome - Support to the salt option of the Pagis project.** Lindstroem Jensen, K.E. (Commission of the European Communities, Luxembourg). 1987. 88p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752572/JAW.

The study, which is a support to the Pagis project, covers three tasks concerning the evaluation of the Danish salt dome Mors (variant disposal site): evaluation of the human intrusion scenario where a cavern is excavated near the HLW-repository by solution mining technique. The waste is supposed to be leached during the operation period until the abandoned cavern is closed by convergence and the contaminated brine is pressed up into the overburden. Evaluation of the brine intrusion scenario, where the HLW-repository is inadvertently located close to a major brine pocket which subsequently releases its brine content through defects in the repository to the discharge stream for the catchment area. Collection and description of hydrological data of surface and deep layers (down to circa 700 metres) in the repository region. The data will be used by GSF to calculate the radionuclide migration in the geosphere.

35794 **(EUR—11057) Development and active demonstration of acid digestion of burnable plutonium bearing solid wastes. Part. 1. Results. Part 2. Tables and figures.** Wieczorek, H.; Oser, B.; Deckwer, W.D. (Commission of the European Communities, Luxembourg). 1987. 252p. (In German). NTIS (US Sales Only), PC A12/MF A01. Order Number DE88752574/JAW.

The investigations were focused on the active demonstration of the process in a technical scale plant by treatment of 790 kg of waste which contained about 7 kg of plutonium. Complete oxidation of the waste material is achieved within 15 min in sulfuric acid (kept under oxidizing condition by nitric acid) at 250 deg C. At 250 deg C with permanent stirring a rate of plutonium oxide to plutonium sulfate conversion of up to 99.9% is obtained within 8 hours.

The waste oxidation product, besides offgas, is a residue of 320 g per kg waste digested. Precipitation of plutonium is achieved with an efficiency of 88% using cetylpyridinium nitrate. Active process demonstration was performed in a plant of 10 kg capacity per daily run from March 1983 until June 1985. The average waste throughput achieved was 4.1 kg waste per run (maximum 10.4 kg). The plutonium decontamination factors were 10/sup 10/ for the cleaned offgas and 10/sup 6/ for the liquid secondary waste. Tantalum as a potential construction material for the digester does not exhibit specific corrosion; its surface corrosion is 0.1 mm per annum at the maximum.

35795 **(EUR—11069) Pore volume and pore size distribution of cement samples measured by a modified mercury intrusion porosimeter.** Zamorani, E.; Blanchard, H. (Commission of the European Communities, Ispra (IT)). (Commission of the European Communities, Luxembourg). 1987. 15p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753951/JAW.

Important parameters for the characterization of cement specimens are mechanical properties and porosity. This work is carried out at the Ispra Establishment of the Joint Research Centre in the scope of the Radioactive Waste Management programme. A commercial Mercury Intrusion Porosimeter was modified in an attempt to improve the performance of the instrument and to provide fast processing of the recorded values: pressure-volume of pores. The dead volume of the instrument was reduced and the possibility of leakage from the moving parts eliminated. In addition, the modification allows an improvement of data acquisition thus increasing data accuracy and reproducibility. In order to test the improved performance of the modified instrument, physical characterizations of cement forms were carried out. Experimental procedures and results are reported.

35796 **(EUR—11081-Vol.2) Potential for creation of a salt dome following disposal of radioactive waste in a salt layer. Volume 2.** Fries, G. (Commission of the European Communities, Luxembourg). 1987. 144p. (In French). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88752575/JAW.

The study aims at quantifying the possibility of creation of a salt dome from a salt layer in which heat-emitting radioactive waste would be buried. Volume 1 describes the results of numerical computer simulations, and of laboratory-scale models in centrifuges. Volume 2 envisages, in a geological perspective, the origin of salt domes, the mechanisms of thei formation, and the associated parameters.

35797 **(EUR—11096) Transport by groundwater of radionuclides released after flooding of a repository in a salt dome.** Glasbergen, P.; De Greef, E.; Hassanizideh, S.M. and others. (RIVM, Bilthoven (NL)). (Commission of the European Communities, Luxembourg). 1987. 66p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753953/JAW.

The transport of radionuclides in geological media by brines of high salinity is studied with the especially-developed METROPOL computer code (Method for the transport of pollutants). This work is part of the Community MIRAGE project, research area No 7 'Modelling studies'.

35798 **(EUR—11305) Measurement of low permeabilities and of pinpoint hydraulic load variations as a function of depth in crystalline formations.** (Commission of the European Communities, Luxembourg). 1987. 143p. (In French). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88753960/JAW.

As part of the programme on management and storage of radioactive wastes, the PIEZOFOR system was improved in two directions, with a view to hydrogeological measurements in low permeability crystalline formations: - the special casing of the boreholes, on the one hand; - the measurement probe, on the other hand. In parallel, a specific software package for automatic interpretation of the measurements was put into operation.

35799 **(GAO/RCED—86-143) Nuclear waste: Impact of Savannah River plant's radioactive waste management practices.** (General Accounting Office, Washington, DC (USA)). 1986. 64p. General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

Radioactivity contained in the environment outside the Savannah River Plant boundary is well within applicable standards. Within the plant boundary, however, some of the surface streams contain elevated levels of radioactivity, and the soil and groundwater at several waste storage and disposal sites are highly contaminated with radioactivity. SRP has taken several actions to reduce radioactive releases into the environment. However, the waste storage and disposal sites may require long-term institutional control. In addition to the actions, SRP is preparing an environmental impact statement to evaluate the effect of its waste management practices on groundwater quality and to assess remedial actions that may be needed.

35800 **(GAO/RCED—86-206FS) Nuclear waste: Quarterly report on DOE's nuclear waste program as of June 30, 1986.** (General Accounting Office, Washington, DC (USA)). 1986. 22p. General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The Department of Energy's status of nuclear waste program activities for the quarter ending June 30, 1986 included (1) final environmental assessments for first repository sites and recommendations for sites in Nevada, Texas, and Washington for site characterization; (2) postponement of any site-specific work on a second repository; and (3) collection of over $166 million in fecs and investment income.

35801 **(GAO/RCED—87-92) Nuclear waste: DOE should provide more information on monitored retrievable storage.** (General Accounting Office, Washington, DC (USA)). 1987. 70p. General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The Department of Energy is proposing the construction of a monitored retrievable storage facility primarily for waste preparation and packaging rather than for long-term storage as envisioned by the Nuclear Waste Policy Act. While the MRS would be capable of storing spent fuel for long periods, most of the storage that would take place at the facility would be temporary until the spent fuel could be shipped to the repository. GAO does not believe that DOE's proposal is sufficiently comprehensive for the Congress to make an informed decision on the cost of, need for, or consequences of integrating an MRS into the waste management system, or whether the benefit attributed to the MRS can be better achieved by other means. The Congress needs to be aware of the consequences of not approving an MRS as well as the implications of authorizing it. DOE's proposal does not identify the most effective configuration of the authorized waste management system for the Congress to use as a basis for comparison in deciding if the benefits of the proposed MRS facility are worth its added cost to the waste program.

35802 **(GAO/RCED—87-121) Nuclear waste: A look at current use of funds and cost estimates for the future.** (General Accounting Office, Washington, DC (USA)). 1987. 82p. General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The Department of Energy has revised its long-range cost estimates for the disposal of spent nuclear fuel and other highly radioactive waste from about $20 billion to between $21 billion and $41 billion. Delays in meeting some program milestones have added to the costs of the program and consequently DOE has proposed a 5-year delay for the first repository to come on-line. These program uncertainties will limit confidence in the estimates for the next several years. One such uncertainty is the estimated quantity of spent fuel for disposal. DOE's estimating approach overstates the amount of spent fuel that utilities will generate and the fees that they will pay into the Nuclear Waste Fund. As a result, DOE may not be collecting fees at a rate that will cover total program costs and may be overbuilding the waste system.

35803 **(GAO/RCED—87-186FS) Nuclear waste: Quarterly report on DOE's nuclear waste program as of June 30, 1987.** (General Accounting Office, Washington, DC (USA)). 1987. 28p. General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

Department of Energy nuclear waste activities during the quarter ending June 30, 1987 include extension of the operational data planned for the first repository from January 1998 to 2003; a proposal to construct and operate a monitored retrievable storage facility in Roane County, Tennessee; and a decision to delay site-specific work for a second repository and begin in 1995 a national survey of potential second repository sites. The Nuclear Waste Fund collected over $170 million in fees and investment income during the quarter and obligated about $31 million for program activities. The fund balance as of June 1987 was about $1.5 billion. During this quarter, several legislative proposals were introduced in the Congress that would redirect or significantly change the nuclear waste management program.

35804 **(IL—232) Study concerning the geological storage of radioactive waste in the Netherlands. Second interim report on phase 1 (January 1986-January 1987).** (Ministerie van Economische Zaken, The Hague (Netherlands). Commissie Opberging te Land). Mar 1987. 113p. (In Dutch). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88702273/JAW.

This report presents an intermediate state of affairs in the execution of the first stage of the program of research concerning the geological storage of nuclear waste in the Netherlands (OPLA-program). This first stage consists of desk studies and laboratory investigations in view of the judgement of the desirability of continuation of this program in eventual next steps with field research. 19 refs.; 11 figs.; 1 table.

35805 **(INIS-mf—11132) Cost study on waste management at three model Canadian uranium mines. Final report.** (Kilborn (Saskatchewan) Ltd., Saskatoon (Canada)). Mar 1984. 247p. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702090/JAW.

Prepared for the National Uranium Tailings Program.

A waste management cost study was initiated to determine the capital and operating costs of three different uranium waste management systems which incorporate current technologies being used in Canadian uranium mining operations. Cost estimates were to be done to a thirty percent level of accuracy and were to include all waste management related costs of a uranium ore processing facility. Each model is based on an annual uranium production of 1,923,000 kg U (5,000,000 lbs U_3O_8) with a total operating life of 20 years for the facility. The three models, A, B, and C, are based on three different uranium ore grades, 0.10 percent U_3O_8, 0.475 percent U_3O_8 and 1.5 percent U_3O_8 respectively. Yellowcake production is assumed to start in January 1984. Model A is based on a conceptual 7,180 tonne per day uranium ore processing facility and waste management system typical of uranium operations in the Elliot Lake area of northern Ontario with an established infrastructure. Model B is a 1.512 tonne per day operation based on a remote uranium operation typical of the Athabasca Basin properties in northern Saskatchewan. Model C is a 466 tonne per day operation processing a high-grade uranium ore containing arsenic and heavy metal concentrations typical of some northern Saskatchewan deposits.

35806 (INIS-mf—11153, pp 50-55) **6. Radioactive wastes from nuclear power plants.** Neumann, L. 1987. (In Czech). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88780081/JAW.

In Nuclear power. CAEC lecturers' manual.

The production of radioactive wastes in nuclear power and the current concept of their disposal are explained. This is based on the so-called multibarrier principle using a system of several barriers each of which barring radioactive materials from penetrating the environment. The types are characterized of radioactive wastes produced by WWER nuclear power plants also used in the CSSR. It is revealed that each WWER-440 unit produces several hundred cubic meters of liquid radioactive concentrates annually containing several hundreds dozen of tons of non-active salts and radionuclides in the amount of an order of 10^{13} Bq. The volume of saturated ion exchangers is lower by about one order, their summation activity is similar or slightly higher. The activity of solid wastes is higher by several orders. Radioactive waste processing and disposal in the CSSR are then treated and very high-level wastes are discussed. The possibilities are briefly outlined of the solution of the nuclear power plant fuel cycle problems with respect to radioactive wastes in future. (Z.M.).

35807 **(INIS-mf—11158) Radium removal from Canadian uranium mining effluents by a radium-selective ion exchange complexer.** (Melis Consulting Engineers Ltd., Saskatoon, Saskatchewan (Canada); Canada Centre for Mineral and Energy Technology, Ottawa, Ontario). Jul 1984. 148p. NTIS (US Sales Only), PC A07/MF A01. Order Number DE88702338/JAW.

Prepared for the National Uranium Tailings Program.

A laboratory test program was initiated by the Department of Energy, Mines and Resources as part of the National Uranium Tailings Program to investigate the applicability of a radium-selective ion exchange complexer for removing radium from Canadian uranium mining effluents. The ion exchange complexer was shown to be efficient in removing radium from contaminated water of uranium mining operations, with the ultimate loading capacity of the resin on one type of water treated being determined as approximately 1,600 Bqcm^3 of new resin. The results showed that the resin was effective in removing radium but not any other contaminants.

35808 **(INIS-mf—11161) Report on the collection of data relevant to the Canadian National Uranium Tailings Program.** Smith, A. (Canada Centre for Mineral and Energy Technology, Ottawa, Ontario). Oct 1984. 310p. NTIS (US Sales Only), PC A14/MF A01. Order Number DE88702341/JAW.

In December of 1983, Systemhouse Ltd. was awarded a contract to collect data relevant to the Canadian National Uranium Tailings Program and to convert it into a machine readable format. The work was carried out in four phases, namely, data identification, data collection, data transcription/conversion and data verification. The main priority was to identify as much relevant data as possible. The identified data was priorized against a predefined criteria established in conjunction with the project scientific authority. A total of 428 studies were identified as being relevant. Data from 19 of these were converted to machine-readable format, giving information on 2398 samples from 78 boreholes.

35809 (INIS-mf—11195, pp 1-18) **High level nuclear wastes.** Lopez Perez, B. 1987. NTIS (US Sales Only), PC A10/MF A01. Order Number DE88780093/JAW. (CONF-8505386—).

From Seminar on the use of glasses and glass-ceramics for nuclear waste management; Madrid, Spain (21 May 1985).

The transformations involved in the nuclear fuels during the burn-up at the power nuclear reactors for burn-up levels of 33.000 MWd/th are considered. Graphs and data on the radioactivity variation with the cooling time and heat power of the irradiated fuel are presented. Likewise, the cycle of the fuel in light water reactors is presented and the alternatives for the nuclear waste management are discussed. A brief description of the management of the spent fuel as a high level nuclear waste is shown, explaining the reprocessing and giving data about the fission products and their radioactivities, which must be considered on the vitrification processes. On the final storage of the nuclear waste into depth geological burials, both alternatives are coincident. The countries supporting the reprocessing are indicated and the Spanish programm defined in the Plan Energetico Nacional (PEN) is shortly reviewed. (author) 8 figs., 4 tabs.

35810 (INIS-mf—11195, pp 19-42) **Nature of the glassy state. Implications for radioactive waste storage.** Shackelford, J.F. 1987. NTIS (US Sales Only), PC A10/MF A01. Order Number DE88780093/JAW. (CONF-8505386—).

From Seminar on the use of glasses and glass-ceramics for nuclear waste management; Madrid, Spain (21 May 1985).

Glass is a primary candidate for the storage of radioactive waste. The glassy state is defined in themes of atomic-scale struc-

ture, viz., short-range order (building blocks) and long-range randomness. On the microstructural-scale, these non-crystalline solids may exhit phase separation. Optical and mechanical properties are central to the general structural applications of glasses. Transport properties are of special importance to the use of glasses for nuclear repository. Both gaseous and ionic diffusion can be involved. (author) 9 figs.

35811 (INIS-mf—11195, pp 43-68) **Liquid immiscibility in glasses and nuclear waste management.** Rincon, J.M. (Instituto de Ceramica y Vidrio, Madrid (Spain)). 1987. NTIS (US Sales Only), PC A10/MF A01. Order Number DE88780093/JAW. (CONF-8505386—).

From Seminar on the use of glasses and glass-ceramics for nuclear waste management; Madrid, Spain (21 May 1985).

The glass-in-glass phase separation or liquid immiscibility in glasses has been widely investigated in the past due to its applications in glazes, opal glasses and glass-ceramics. Since that time, the thermodynamics of the miscibility domes in equilibria diagrams, binaries of ternaries, has been established. Nowadays, the immiscibility studies are emerging due to the vitrification of the nuclear wastes and location in adequate geological burial for longer time. The focus of recent researches is to determine the partition ratio of radioelement between different phases separated from different chemical leaching, as well as the miscibility gaps in the Na_2O-B_2O_3-SiO_2 system including one or several elements which could be contained in a high or low level nuclear waste. (author) 14 figs., 2 tabs.

35812 (INIS-mf—11195, pp 95-106) **Formation of NZP ceramics for the immobilization of radionuclides.** Alamo, J. (Valencia Univ. (Spain). Dept de Quimica Inorganica). 1987. NTIS (US Sales Only), PC A10/MF A01. Order Number DE88780093/JAW. (CONF-8505386—).

From Seminar on the use of glasses and glass-ceramics for nuclear waste management; Madrid, Spain (21 May 1985).

The problem of Radioactive Waste Management is briefly outlined from the crystal chemical point of view. Some alternatives (glasses and ceramics) are compared and the synthesis and properties of NZP ceramics are reviewed. (author) 5 figs., 1 tab.

35813 (INIS-mf—11195, pp 121-139) **Chemical durability of silicoborate glasses.** Nieto, M.I.; Rodriguez, M.A.; Rubio, J.; Fernandez, A.; Oteo, J.L. (Instituto de Ceramica y Vidrio, Madrid (Spain)). 1987. NTIS (US Sales Only), PC A10/MF A01. Order Number DE88780093/JAW. (CONF-8505386—).

From Seminar on the use of glasses and glass-ceramics for nuclear waste management; Madrid, Spain (21 May 1985).

A general view of the durability in silicoborate glasses is presented with more emphasis on the etching factors (chemical composition, lattice structure, pH...) the techniques used for this study and the experimental results. Likewise, the research presently developed in this area at the Instituto de Ceramica y Vidrio, CSIC, is related to the applications. Future research in this field is also mentioned. (author) 15 figs.

35814 (INIS-mf—11195, pp 141-178) **Alteration of national glass in radioactive waste repository host rocks: A conceptional review.** Apps, J.A. (Lawrence Berkeley Lab., CA (USA)). 1987. NTIS (US Sales Only), PC A10/MF A01. Order Number DE88780093/JAW. (CONF-8505386—).

From Seminar on the use of glasses and glass-ceramics for nuclear waste management; Madrid, Spain (21 May 1985).

The storage of high level radioactive wastes in host rocks containing natural glass has potential chemical advantages, especially if the initial waste temperatures are as high as 250°C. However, it is not certain how natural glasses will decompose when exposed to an aqueous phase in a repository environment. The hydration and devitrification of both rhyolitic and natural basaltic natural glasses are reviewed in the context of hypothetical thermodynamic phase relations, infrared spectroscopic data and laboratory studies of synthetic glasses exposed to steam. The findings are compared with field observations and laboratory studies of hydrating and devitrifying natural glasses. The peculiarities of the dependence of hydration and devitrification behaviour on compositional variation is noted. There is substantial circumstantial evidence to support the belief that rhyolitic glasses differ from basaltic glasses in their thermodynamic stability and their lattice structure, and that this is manifested by a tendency of the former to hydrate rather than devitrify when exposed to water. Further research remains to be done to confirm the differences in glass structure, and to determine both physically and chemically dependent properties of natural glasses as a function of composition. (author) 7 figs.

35815 (INIS-mf—11195, pp 179-208) **Radiation damage in nuclear waste glass.** DeNatale, J.F. (California Univ., Davis (USA). Dept. of Mechanical Engineering). 1987. NTIS (US Sales Only), PC A10/MF A01. Order Number DE88780093/JAW. (CONF-8505386—).

From Seminar on the use of glasses and glass-ceramics for nuclear waste management; Madrid, Spain (21 May 1985).

Silicate glass is a promising material for the containment of nuclear wastes. The need for an accurate characterization of the waste properties makes an understanding of the radiation response of the glass an important issue. There are a number of ways in which the self-generated radiation may affect the glass, both in terms of its structure and chemistry. There are also a number of different techniques for characterizing these effects and it is important to be aware of their limitations and the significance of these measurements. The radiation damage to simulated nuclear waste glass appears as the decompositition of the glass. This is often accompanied by the formation of sub-micron oxygen bubbles and the development of an amorphous phase separation. This type of damage has been observed under electron, gamma and ion irradiations, and a comparison of the separate responses can be used to quantitatively determine the radiation effect in nuclear waste glasses. 35817 **(INIS-XN—122) International hydrocoin project. Groundwater hydrology modelling strategies for performance assessment of nuclear waste disposal.** (Nuclear Energy Agency, 75 - Paris (France)). 1987. 25p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702391/JAW.

The International HYDROCOIN (Hydrologic Code Intercomparison) Project was started in May 1984. Fourteen organizations participate in the Project, with the Swedish Nuclear Power Inspectorate (SKI) as managing participant and the OECD Nuclear Energy Agency (NEA) taking part as a member of the Project secretariat. HYDROCOIN is concerned with the assessment of groundwater movements at potential nuclear waste disposal sites with the help of mathematical models and computer codes. The Project is divided into three levels. The objective of HYDROCOIN Level 1 is to verify the accuracy of groundwater flow codes. HYDROCOIN Level 2 and Level 3 are concerned with validation of hydrological models and uncertainty/sensitivity analysis, respectively. This report, which has been prepared by the NEA Secretariat and SKI in consultation with the co-ordinating group of the HYDROCOIN Project summarizes the background and objectives of the Project and presents the results of the work performed up to the middle of 1987. It is intended to provide general information on HYDROCOIN to interested parties beyond the group of directly involved specialists.

35818 (Juel-Spez—394) Treatment of radioactive waste in the nuclear fuel cycle. Merz, E. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Chemische Technologie der Nuklearen Entsorgung). Mar 1987. 173p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88753573/JAW.

The report explains the various methods and steps of radioactive waste treatment in the nuclear fuel cycle for interested readers who are not familiar with the subject. The term 'waste management' is illustrated with special regard to the situation in the FRG, and concepts such as reprocessing, direct ultimate disposal of spent fuel elements are explained. Nuclear spent fuel reprocessing is dealt with only as far as it is of significance to the waste management. The report concentrates on the discussion of the various nuclear waste types, and their handling, of reprocessing methods and waste conditioning methods, and of ultimate disposal (in underground geological spaces, on the seafloor, or in trenches). Interim storage, transport, safety and nuclear safeguards are also dealt with in this context. A concise glossary of terms and hints for further reading are attached.

35819 (KFA-DE-IB—3/87) Waste water monitoring in the Juelich Nuclear Research Center in 1986. Zange, E.; Zaddach, G.; Schlenter, W. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Abt. Dekontamination). Apr 1987. 27p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753578/JAW.

Due to slightly increased radioactivity values, two batches of a storage tank of 2000 m^3 had to be decontaminated. Amounts of low-level radioactive waste water increased by 10% as compared with the last year (30 600 m^3 in 1981, 21 500 m^3 in 1986). The volume of low-level waste water collected in the receiver tanks increased by 17% over last year, and by 30% compared with the 1980 volume. Aggregate (β + EC) activity in the low-level liquid effluents was 573 GBq in the reporting year (mean value 559 GBq in the years 1983 to 1985). In 1986, the I-131 radioactivity in the liquid effluents from the medical department was 306 GBq, or 53.4%. All these effluents have again been led to the storage tanks of the TD-DE facilities, for interims storage and decay of short-lived radioactivity. The waste water volume received from external institutions was higher by 9%., and the contents of α-emitters were lower by 62%, of (β + EC)-emitters by 16%, and of tritium by 10%. The decontamination evaporators of KfA Juelich received 3.160 m^3 of liquid effluents in the year under review, with an aggregate activity (without H3) of 262 GBq. The retention coefficient was 99.883%.

35820 (KFK—4324) In-situ corrosion studies on selected high-level waste packaging materials under simulated disposal conditions in rock salt formations. Schwarzkopf, W.; Smailos, E.; Koester, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Nukleare Entsorgungstechnik). Jan 1988. 19p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753580/JAW.

This work reports about in situ corrosion experiments on unalloyed steels, Ti 99,8-Pd, Hastelloy C4, and iron-base alloys, as modular cast iron, Ni-Resist D4 and Si-cast iron, under simulated disposal conditions. The experiments were carried out in the frame of the GermanUS Brine Migration Test in heated tubed boreholes in the Asse salt mine at T = 150°C to 210°C, both in the absence and in the presence of a γ-radiation field of 3 x 10^2 Gyh (Co-60 source). In addition, the material used to protect the tubing from corrosion (Inconel 600) as well as the backfill material for the annular gap (Al_2O_3 spheres) were investigated for possible corrosion attack. All materials investigate exhibited high resistance to corrosion under the conditions prevailing in the Brine Migration Test. All material specimens corroded at much lower rates than determined in the previous laboratory-scale tests. All materials and above all the materials with passivating oxide layers such as Ti 99.8-Pd and Hastelloy C4 which may corrode selectively already in the presence of minor amounts of brine had been resistant with respect to any type of local corrosion attack. The γ-radiation of 3 x 10^2 Gyh did not exert an influence on the corrosion behaviour of the materials. No corrosion attacks were observed on the Al_2O_3 spheres. In the case of Inconel 600 traces of sulphur were detected probably resulting from the reaction of Ni with H_2S to NiS. Measurable general and local corrosion, however, have not been observed. (orig.IHOE).

35821 (LA—11246-MS) Preliminary report on the statistical evaluation of sorption data: Sorption as a function of mineralogy, temperature, time, and particle size. Beckman, R.; Thomas, K.; Crowe, B. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 26p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009204/JAW.

This report studies the transport of radionuclides from a repository to the environment by dissolution of the stored solid-waste form and subsequent transport in water. The sorption process may retard this movement of radionuclides from the repository to the accessible environment. A measure of this retardation process is the sorption ratio, R/sub D/, where R/sub D/ = (activity in solid phase per unit mass of solid)(activity in solution per unit volume of solution). In this study, predictions of the R/sub D/ values for the elements barium, cerium, cesium, europium, and strontium are developed from linear regression techniques. An R/sub D/ value was obtained for numerous drill core samples. Additional data include the particle size of the rock, temperature condition during the experiment, concentration of the sorbing element, and length of the sorption experiment. Preliminary regression results based on these data show that the temperature and length of the experiment are the most significant factors influencing the R/sub D/ values. Particle size has a slight effect, and based on a small amount of data, it appears that concentration had no effect. The x-ray diffraction data are used to classify the samples by mineralogy, and regression techniques are used to develop estimates of the R/sub D/ values. Zeolite abundance of 10% or more with some addition of clay increases the sorption values significantly. 12 refs., 3 figs., 6 tabs.

35822 (LA—11289-MS) A preliminary comparison of mineral deposits in faults near Yucca Mountain, Nevada, with possible analogs. Vaniman, D.T.; Bish, D.L.; Chipera, S. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 59p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010486/JAW.

Several faults near Yucca Mountain, Nevada, contain abundant calcite and opal-CT, with lesser amounts of opal-A and sepiolite or smectite. These secondary minerals are being studied to determine the directions, amounts, and timing of transport involved in their formation. Such information is important for evaluating the future performances of a potential high-level nuclear waste repository beneath Yucca Mountain. This report is a preliminary assessment of how those minerals were formed. Possible analog deposits from known hydrothermal veins, warm springs, cold springs or seeps, soils, and aeolian sands were studied by petrographic and x-ray diffraction methods for comparison with the minerals deposited in the faults; there are major mineralogic differences in all of these environments except in the aeolian sands and in some cold seeps. Preliminary conclusions are that the deposits in the faults and in the sand ramps are closely related, and that the process of deposition did not require upward transport from depth. 35 refs., 25 figs.

35823 (LA—11292-MS) Mineralogy of drill hole UE-25p#1 at Yucca Mountain, Nevada. Chipera, S.J.; Bish, D.L. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 25p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010487/JAW.

Drill hole UE-25p{number←sign}1 is located east of the candidate repository block at Yucca Mountain, Nevada, and as such provides information on the geology of the accessible environment. The hole was drilled to a depth of 1807 m (5923 ft) and is unique in that it penetrates tuffs that are older than any volcanic units previously encountered in drill holes at Yucca Mountain. In addition, it is the only hole drilled to date that penetrates the base of the tuff sequence and enters the underlying Paleozoic dolomite basement. We have examined the mineralogy of drill cuttings, core, and sidewall samples from drill hole UE-25p{number←sign}1 is similar to that in the other drill holes examined at Yucca Mountain. The only significant differences in mineralogy from other drill holes include the presence of dolomite in the Paleozoic carbonate

rocks and the occurrence of up to 3% laumontite, a Ca-zeolite, in four samples of the Lithic Ridge Tuff. 15 refs., 5 figs., 4 tabs.

35824 **(LA—11293-MS) Statistical guidelines for planning a limited drilling program.** Campbell, K. (Los Alamos National Lab., NM (USA)). Jun 1988. Contract W-7405-ENG-36. 51p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010488/JAW.

Site characterization for potential nuclear waste repository at Yucca Mountain in south-central Nevada will include the construction of a limited number of new drill holes to depths below the repository horizon from which information about the properties of the surrounding and underlying tuffs can be obtained. Quantitative techniques to estimate the amount of information to be gained from a proposed drilling plan are developed. These estimates are to be compared with economic costs and with risk analysis requirements for the potential repository. In some cases the existing data, although extremely limited, are sufficient for preliminary application of these methods. 33 refs., 19 figs., 3 tabs.

35825 **(LBL—21697) Transient and steady-state radionuclide transport through penetrations in nuclear waste containers.** Chambre, P.L.; Lee, W.W.L.; Kim, C.L.; Pigford, T.H. (Lawrence Berkeley Lab., CA (USA)). Dec 1986. Contract AC03-76SF00098. 11p. (CONF-861207—117). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012014/JAW.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

In this paper we analyze the transport of radionuclides through penetrations in nuclear waste containers. Penetrations may result from corrosion or cracks and may occur in the original container material, in degraded or corroded material, or in deposits of corrosion products. We do not consider how these penetrations occur or the characteristics of expected penetrations in waste containers. We are concerned only with the analytical formulation and solutions of equations to predict rates of mass transfer through penetrations of specified size and geometry. Expressions for the diffusive mass transfer rates through apertures are presented. We present numerical illustrations for steady-state mass-transfer rates through a circular hole, including concentration isopleths. The results are extended to multiple holes, including a criterion for hole spacing wherein superposition of single-hole solutions can be used. Results illustrated for holes in thin-walled containers show that significant mass transfer can occur even if a small fraction of the container area is perforated. We also illustrate the case of holes facing a water gap, instead of being in intimate contact with porous rock. In this case the radionuclide flux from many small holes approaches that from a bare waste cylinder.

35826 **(LBL—24599-Rev.) Mass transfer and transport in geologic repositories: Analytical studies and applications.** Pigford, T.H.; Chambre, P.L.; Lee, W.W.L. (Lawrence Berkeley Lab., CA (USA)). Mar 1988. Contract AC03-76SF00098. 6p. (CONF-880601—19-Rev.; CONF-880601—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009833/JAW.

From American Nuclear Society annual meeting; San Diego, CA, USA (12 Jun 1988).

Assessing the long-term performance of geologic repositories for radioactive waste requires reliable quantitative predictions of rates of release of radionuclides from the waste into the rock, transport through the geologic media, cumulative release to the accessible environment, and maximum concentrations in ground water and surface water. Here we summarize our mass transfer approach to making these predictions. 32 refs.

35827 **(LBL—24796) Estimating properties of unsaturated fractured formations from injection and falloff tests.** Mishra, S.; Bodvarsson, G.S.; Attanayake, M.P. (Lawrence Berkeley Lab., CA (USA)). Dec 1987. Contract AC03-76SF00098. 54p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88008398/JAW.

A new technique for calculating hydraulic properties of unsaturated fractured formations is proposed as an alternative to the common approach involving steady-state analysis of multi-rate gas injection tests. This method is based on graphical analysis of unsteady-state pressure-time data from an injection-falloff test sequence. Both gas and water injection testing are considered. Flow in a horizontal fracture of limited lateral extent, bounded above and below by an impermeable matrix, and intersected by a cylindrical borehole is described by two analytical models developed in this study. The first model corresponds to the early-time infinite acting radial flow period, and the second to the late-time linear flow period. Interpretive equations are derived for computing fracture conductivity and volumetric aperture from early-time pressure data, and fracture width from late-time pressure data. Effects of fracture inclination and gravity are studied numerically and found to be practically negligible for gas as well as water injection. Two simulated injection-falloff tests are analyzed using the suggested procedure. Results are found to be in good agreement with simulator input values. 13 refs., 14 figs., 4 tabs.

35828 **(MLM—3493) Glass furnace processing of Rocky Flats Plant wastes: An evaluation.** Klingler, L.M.; Abellera, P.L. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). 29 Apr 1988. Contract AC04-76DP00053. 58p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010333/JAW.

This report evaluates the use of a joule-heated glass furnace to treat four Rocky Flats Plant waste streams. These streams are extremely large, are primarily water soluble inorganic salts, and can be contaminated with hazardous organic material, toxics, andor radioactivity. It runs closely simulating actual process type runs, the glass furnace effectively treated these wastes by degrading the salts to oxides that can be incorporated along with radioactivity and toxic metals into a highly stable glass matrix. Most of the gaseous by-products of the waste treatment can be handled by a wet offgas scrubbing system. Two major exceptions are NO/sub x/ and volatile organics. This study has provided additional evidence that NO/sub x/ can be adequately controlled by means of the adding NH_3 to the gases in the furnace chamber. To prepare glass with optimum characteristics, batch compositions were computer selected for this study. The quantities of glass-making chemical additives required to prepare glass to this formulation effectively eliminated any process volume reduction potential for some of the wastes. 1 ref., 17 figs., 20 tabs.

35829 (NAGRA-NTB—87-15, pp 271-286) **Overview of Nagra's geological investigation programme in Northern Switzerland.** Thury, M.; Diebold, P. (Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland); Herznach (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

For the assessment of the feasibility and safety of a repository for high level radioactive waste, Nagra (National Cooperative for the Storage of Radioactive Waste) has started in 1980 in central Northern Switzerland an extensive geological investigation program. This overall program contains four field investigation programs and several programs for synthesis work. By the end of 1985, six deep drillings have been completed. The deepest borehole reached 2482 m. All in all, more than 8000 m of cores have been taken and analyzed in detail. In the boreholes, extensive hydrogeological tests have been carried out. Within the regional geophysical investigation program gravimetric, aeromagnetic and magnetotelluric, refraction seismic and reflection seismic surveys have been carried out. Vibroseis lines of 400 km length have been measured. Within the regional hydrogeological program, water samples of more than 100 springs and wells with hydrochemically or thermally abnormal waters have been analyzed in detail for their chemical and isotopic composition. Within the neotectonic program, geomorphologic, tectonic, geodetic and seismic studies and measurements have been carried out. In 1983, a microearthquake survey network was installed. All these data were analyzed in several synthetic programs: Structural geology, hydrochemistry, hydrodynamic modelling and long term stability scenarios. The Nagra program continues. As next, a deep borehole in the Canton of Schaffhausen is planned. Meanwhile all data were analyzed in detail and the understanding of the regional and local geology, geochemistry and hy-

drogeology of northern Switzerland is improved and refined. (author) 32 refs., 8 figs.

35830 (NSS/R—102) Nirex safety assessment research programme for 1987/1988. Cooper, M.J.; Tasker, P.W. (United Kingdom Nirex, Ltd.; UKAEA Harwell Lab. Materials Physics and Metallurgy Div.). Oct 1987. 56p. (AERE-R—12816). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753611/JAW.

This report outlines the work of the Nirex Safety Assessment Research Programme during the period 1st April 1987 to 31st March 1988. The research programme has the specific objective of providing the information requirements of the post-emplacement radiological safety case for the disposal of low-level and intermediate-level radioactive waste in underground repositories. For convenience the programme has been divided into seven areas: physical containment, near-field radionuclide chemistry, evolution of the near-field aqueous environment, mass transfer in the geosphere, the biosphere, gas evolution and migration, and integrated studies. The near-field includes the waste, its immobilising medium, its container, the engineered structure in which the container is emplaced and the immediately adjacent geological formation disturbed by the construction of the repository.

35831 (NSS/R—105) Autogenous healing of cracks in concrete and its relevance to radwaste repositories. Guppy, R. (UKAEA Harwell Lab. Materials Development Div.). (United Kingdom Nirex, Ltd.). Mar 1988. 23p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753994/JAW.

Cracks in concrete structures within a radioactive waste repository could provide fast transport pathways and as such could impair the performance of the concrete as a barrier to radionuclide migration. It has been widely reported that cracks in concrete can heal and, therefore, the evidence in support of this phenomenon has been reviewed and its relevance to a concrete barrier in a radioactive waste repository assessed. The mechanism of crack healing is not understood, but the most likely process responsible is calcite formation under wet conditions. There is doubt concerning whether the conditions in a repository will be suitable for crack healing; especially if the cement is extensively modified with slag or fuel ash. It is concluded that further experimental work is required to assess the impact of this phenomenon on the behaviour of cracks in repositories.

35832 (NSS/R—108) Comparative study of the pore structures and surfaces of hardened cement pastes of potential use in radioactive waste repositories. Rowan, S.M.; Donaldson, L.; White, S. (Trent Polytechnic, Nottingham (UK)). (United Kingdom Nirex, Ltd.; UKAEA Harwell Lab. Chemistry Div.). Feb 1988. 12p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753995/JAW.

Measurements of water vapour adsorption at 20°C and mercury intrusion have been used to compare the surfaces and pore structures of hardened cement pastes made from ordinary portland cement (OPC) and the additives blast furnace slag (BFS) and pulverised fuel ash (PFA). The results suggest that each additive, after taking part in the hydration reaction with OPC, produces a paste whose gel pore structure is similar to that derived from OPC alone. The BET adsorption surface area of the cement pastes, in the form of half inch diameter coupons was ca. 55 $m^2 g^{-1}$ and was not influenced by the presence of the additives. However the pastes containing the additives have a larger and better interconnected meso and macropore structure than OPC which may account for larger diffusion coefficients reported elsewhere for caesium ions passing through concrete containing BFS in comparison with a concrete containing OPC alone.

35833 (NSS/R—109) Experimental study of solute transport in mudstones. Gilling, D.; Jefferies, N.L.; Lineham, T.R. (United Kingdom Nirex, Ltd.; UKAEA Harwell Lab. Chemistry Div.). Dec 1987. 59p. (AERE-R—12809). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753612/JAW.

Aqueous phase mass transport is considered to be the most likely means by which radionuclides released from an underground radioactive waste repository may return to man and to the environment. One of the options that has been considered by UK Nirex Ltd. for the disposal of radioactive waste is burial in clay-rich sedimentary formations. This report describes experimental techniques developed for the measurement of diffusivity, hydraulic conductivity and solute-accessible porosity in mudstones. In addition, these parameters have been determined for London Clay and the relative importance of diffusive and convective transport in this formation is discussed.

35834 (NUREG—1318) Technical position on items and activities in the high-level waste geologic repository program subject to quality assurance requirements. Duncan, A.B.; Bilhorn, S.G.; Kennedy, J.E. (Nuclear Regulatory Commission, Washington, DC (USA). Div. of High-Level Nuclear Waste Management). Apr 1988. 26p. NTIS, PC A03/MF A01 - GPO. Order Number TI88009805/JAW.

This document provides guidance on how to identify items and activities subject to Quality Assurance in the high-level nuclear waste repository program for pre-closure and post-closure phases of the repository. In the pre-closure phase, structures, systems and components essential to the prevention or mitigation of an accident that could result in an off-site radiation dose of 0.5rem or greater are termed "important to safety". In the post-closure phase, the barriers which are relied on to meet the containment and isolation requirements are defined as "important to waste isolation". These structures, systems, components, and barriers, and the activities related to their characterization, design, construction, and operation are required to meet quality assurance (QA) criteria to provide confidence in the performance of the geologic repository. The list of structures, systems, and components important to safety and engineered barriers important to waste isolation is referred to as the "Q-List" and lies within the scope of the QA program. 10 refs.

35835 (NUREG/CR—4735-Vol.3) Evaluation and compilation of DOE waste package test data: Biannual report, February 1987–July 1987. Interrante, C.; Escalante, E.; Fraker, A.; Hall, D.; Harrison, S.; Liggett, W.; Linzer, M.; Ricker, R.; Ruspi, J.; Shull, R. (National Bureau of Standards, Washington, DC (USA). Metallurgy Div.). May 1988. 159p. NTIS, PC A08/MF A01 - GPO;1. Order Number TI88011119/JAW.

The waste package is a proposed engineering barrier that is part of a permanent repository for HLW. Metal alloys are the principal barriers within the engineered system. Technical discussions are given for the corrosion of metals proposed for the canister, particularly carbon steels, stainless steels, and copper. The current level of understanding of several canister materials is questioned for the candidate repository in tuff. Three issues are addressed, the possibility of the stress-induced failure of Zircaloy, the possible corrosion of copper and copper alloys, and the lack of site-specific characterization data. Discussions are given on problems concerning localized corrosion and environmentally assisted cracking of AISI 1020 steel at elevated temperatures (150{degree}C). For the proposed salt site, the importance of the duration of corrosion tests and some of the conditions that may preclude prompt initiation of needed long-term testing are two issues that are discussed. 31 refs., 5 figs.

35836 (ORNL/Sub—86-SA094/2) Use of transportable storage casks in the nuclear waste management system: Appendices. (H and R Technical Associates, Inc., Oak Ridge, TN (USA); Johnson (E.R.) Associates, Inc., Oakton, VA (USA)). Dec 1987. Contract AC05-84OR21400. 203p. (ORNL/Sub—86-SA224/2; HR/JAI—289). NTIS, PC A10/MF A01;1; GPO Dep. Order Number DE88007846/JAW.

A study was performed to determine the viability of the use of transportable storage casks (TSCs), and other metal casks that are designed primarily for storage but which might be used to ship their stored contents to DOE on a one-time use basis (referred to in this study as storage only casks, or SOCs), in the combined utility/DOE spent fuel management system. The viability of the use of TSCs and SOCs was assessed in terms of the costs and savings involved in their use, the sensitivity of these costs and savings to

changes in the capacity and cost of fabrication of the casks, the impacts of variation in cask design features on cost and radiation exposure of personnel, and their prospective use in connection with the transport of defense high level wastes. Estimates were developed of the costs of acquiring and handling of TSCs and SOCs at reactor sites. For comparison purposes, similar costs were developed for the use of concrete storage casks at reactor sites. Estimates of the savings involved to the DOE system as a result of receiving spent fuel in TSCs or SOCs were separately developed. These costs are developed and presented in Volume 2, Appendices A through J.

35837 **(ORNL/TM—10221) Identification of sites for the low-level waste disposal development and demonstration program.** Ketelle, R.H.; Lee, D.W. (Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OR21400. 38p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010757/JAW.

This report presents the results of site selection studies for potential low-level radioactive waste disposal sites on the Oak Ridge Reservation (ORR). Summaries of the site selection procedures used and results of previous site selection studies on the ORR are included. This report includes recommendations of sites for demonstration of shallow land burial using engineered trench designs and demonstration of above-grade disposal using design concepts similar to those used in tumulus disposal. The site selection study, like its predecessor (ORNL/TM-9717, Use of DOE Site Selection Criteria for Screening Low-Level Waste Disposal Sites on the Oak Ridge Reservation), involved application of exclusionary site screening criteria to the region of interest to eliminate unacceptable areas from consideration. Also like the previous study, the region of interest for this study was limited to the Oak Ridge Department of Energy Reservation. Reconnaissance-level environmental data were used in the study, and field inspections of candidate sites were made to verify the available reconnaissance data. Five candidate sites, all underlain by Knox dolomite residuum and bedrock, were identified for possible development of shallow land burial facilities. Of the five candidate sites, the West Chestnut site was judged to be best suited for deployment of the shallow land burial technology. Three candidate sites, all underlain by the Conasauga Group in Bear Creek Valley, were identified for possible development of above-grade disposal technologies. Of the three sites identified, the Central Bear Creek Valley site lying between State Route 95 and Gum Hollow Road was ranked most favorable for deployment of the above-grade disposal technology.

35838 **(ORNL/TM—10477) Airborne waste management technology applicable for use in reprocessing plants for control of iodine and other off-gas constituents.** Jubin, R.T. (Oak Ridge National Lab., TN (USA)). Feb 1988. Contract AC05-84OR21400. 68p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88007867/JAW.

Extensive work in the area of iodine removal from reprocessing plant off-gas streams using various types of solid sorbent materials has been conducted worldwide over the past two decades. This work has focused on the use of carbon filters, primarily for power plant applications. More recently, the use of silver-containing sorbents has been the subject of considerable research. The most recent work in the United States has addressed the use of silver-exchanged faujasites and mordenites. The chemical reactions of iodine with silver on the sorbent are not well defined, but it is generally believed that chemisorbed iodides and iodates are formed. The process for iodine recovery generally involves passage of the iodine-laden gas stream through a packed bed of the adsorbent material preheated to a temperature of about 150{degree}C. Most iodine removal system designs utilizing silver-containing solid sorbents assume only a 30 to 50% silver utilization. Based on laboratory tests, potentially 60 to 70% of the silver contained in the sorbents can be reacted with iodine. To overcome the high cost of silver associated with these materials, various approaches have been explored. Among these are the regeneration of the silver-containing sorbent by stripping the iodine and trapping the iodine on a sorbent that has undergone only partial silver exchange and is capable of attaining a much higher silver utilization. This summary report describes the US work in regeneration of iodine-loaded solid sorbent material. In addition, the report discusses the broader subject of plant off-gas treatment including system design. The off-gas technologies to recovery No/sub x/ and to recover and dispose of Kr, ^{14}C, and I are described as to their impacts on the design of an integrated off-gas system. The effect of ventilation philosophy for the reprocessing plant is discussed as an integral part of the overall treatment philosophy of the plant off-gas. 103 refs., 5 figs., 8 tabs.

35839 **(ORNL/TM—10773) Comparison of results based on a deterministic versus a statistical uncertainty analysis.** Maerker, R.E. (Oak Ridge National Lab., TN (USA)). May 1988. Contract AC05-84OR21400. 78p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88010751/JAW.

A deterministic method for performing an uncertainty analysis is applied to the results of a system of three codes previously analyzed by purely statistical means. This new method propagates joint probabilities through computer models to obtain the distributions of model results by linear extrapolation from a pool of several gradient-enhanced reference runs. Results employing various options in the method are tested against those from the earlier statistical treatment. Both point-by-point and cumulative distribution comparisons were generally performed. The effort leads to the conclusion that in the present application 15 gradient enhanced runs provide virtually as much uncertainty information as 200 statistical executions of the code system, and this feature of the analysis is expected to remain generally valid for most types of problems. The avantage of significant reduction in the number if reference runs required by the deterministic method is partially offset by the longer execution times of the enhanced versions of the codes, however. Thus efficient derivative-taking algorithms will be necessary to insure cost efectiveness. 6 refs., 25 figs., 17 tabs.

35840 **(PNL—5577-10) Fabrication and characterization of MCC [Materials Characterization Center] approved testing material: ATM-10 glass.** Maupin, G.D.; Bowen, W.M.; Daniel, J.L. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. Contract AC06-76RL01830. 89p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88009441/JAW.

The Materials Characterization Center ATM-10 glass represents a reference commercial high-level waste form similar to that which will be produced by the West Valley Nuclear Service Co. Inc., West Valley, New York. The target composition and acceptable range of composition were defined by the sponsor, West Valley Nuclear Service. The ATM-10 glass was produced in accordance with the Pacific Northwest Laboratory QA Manual for License-Related Programs, MCC technical procedures, and MCC QA Plan that were in effect during the course of the work. The method and procedure to be used in the fabrication and characterization of the ATM-10 glass were specified in two run plans for glass preparation and a characterization plan. All of the ATM-10 glass was produced in the form of bars 1.9 {times} 1.9 {times} 10 cm nominal size, and 93 g nominal mass. A total of 15 bars of ATM-10 glass weighing 1394 g was produced. The production bars were characterized to determine the mean composition, oxidation state, and microstructure of the ATM-10 product. Table A summarizes the characterization results. The ATM-10 glass meets all specifications. The elemental composition and oxidation state of the glass are within the specifications of the client. Visually, the ATM-10 glass bars appear uniformly glassy and generally without exterior features. Microscopic examination revealed low (less than 2 wt %) concentractions of 3-μm iron-chrome (suspected spinel) crystals and {approximately}0.5-μm ruthenium inclusions scattered randomly throughout the glassy matrix. Closed porosity, with pores ranging in diameter from 5 to 250 μm, was observed in all samples. 4 refs., 10 figs., 21 tabs.

35841 **(PNL—6320-2) LFCM [liquid-fed ceramic melter] vitrification technology: Quarterly progress report, January--March 1987.** Brouns, R. A.; Allen, C. R.; Powell, J. A. (comps.). (Pacific Northwest Lab., Richland, WA (USA)). May 1988. Contract AC06-76RL01830. 86p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88011538/JAW.

This report is compiled by the Nuclear Waste Treatment Program and the Hanford Waste Vitrification Program at Pacific Northwest Laboratory to describe the progress in developing, testing, applying and documenting liquid-fed ceramic melter vitrifica-

tion technology. Progress in the following technical subject areas during the second quarter of FY 1987 is discussed: melting process chemistry and glass development, feed preparation and transfer systems, melter systems, canister filling and handling systems, and process/product modeling. 23 refs., 14 figs., 10 tabs.

35842 **(PNL—6381) A synthesis of ethnohistorical materials concerning the administration of Federal Indian policy among the Yakima, Umatilla, and Nez Perce Indian people: Working draft.** Liebow, E.B.; Younger, C.A.; Broyles, J.A. (Battelle Human Affairs Research Center, Seattle, WA (USA)). Nov 1987. Contract AC06-76RL01830. 45p. (BHARC—800/87/022). NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88007884/JAW.

For the purposes of the Nuclear Waste Policy Act, the Confederated Tribes and Bands of the Yakima Indian Nation, the Confederated Tribes of the Umatilla Indian Reservation, and the Nez Perce Tribe have been accorded the status of "Affected Indian Tribe" and have become party to the proceedings to determine a suitable location for the nation's first commercial waste repository. Each of the Tribes has expressed concerns about the suitability of the Hanford Site in eastern Washington. These concerns, in general, address the proposed repository's effects on traditional spiritual beliefs and cultural practices, on tribal sovereignty and the Tribes' right to self-government, on the natural resources under tribal management jurisdiction, and on the health and socioeconomic characteristics of the Tribes' reservation communities. The Yakima, Umatilla, and Nez Perce have distinctive cultural traditions that may be adversely affected by activities related to the Basalt Waste Isolation Project (BWIP). Further, the Tribes enjoy a unique relationship with the federal government. Because of their distinctive cultures and governmental status, particular attention will be paid to expressed interests of the Tribes, and to ways in which these interests may be affected by the repository program. Monitoring is needed to describe current conditions among the Affected Tribes' populations, to describe BWIP site characterization activities affecting the Tribes, and to measure any changes in these conditions that may occur as a direct result of site characterization. This paper reports our first efforts at gathering historical information. It summarizes materials contained in two sources: the reports of field agents to the Commissioner of Indian Affairs (1854-1936), and the dockets of the Indian Claims Commission. 24 refs., 3 figs.

35843 **(PNL—6383) Community interviews task report: Working draft: BWIP [Basalt Waste Isolation Project] Repository Project.** Bolton, P.A. (Battelle Human Affairs Research Center, Seattle, WA (USA)). Nov 1987. Contract AC06-76RL01830. 14p. (BHARC—800/87/025). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008049/JAW.

The socioeconomic program for the Basalt Waste Isolation Project (BWIP) requires the collection of information about economic, social and cultural conditions, demographic, housing and settlement patterns, and the provision of public services and facilities in order to monitor and assess the impacts of the project on the study area. Much of the information needed by the socioeconomic program is compiled, maintained, and used by officials or staff members of local, regional, state, or tribal agencies or organizations. Because much of this information is prepared for internal use, the documents are often not published or advertised and it can be difficult for researchers to identify many obscure, yet useful, sources of information. In order to identify and gain access to this information, it is often most efficient to talk directly with officials and staff members of pertinent agencies or organizations who may have knowledge of these documents or who may have useful information themselves. Consequently, interviews in the study communities with persons knowledgeable about the socioeconomic or sociocultural characteristics of the area constitute an important source of data for the socioeconomic program. In addition to identifying various data sources, these interviews provide a mechanism for understanding and interpreting those data. Knowledge of specific local conditions is often necessary to correctly interpret quantitative data. The purpose of this paper is to summarize the objectives of the community interviews task and the general methods that will be used in conducting the community interviews. 3 refs.

35844 **(PNL—6384) Interim facilities and services profile, Benton and Franklin Counties, Washington: Working draft.** Friedli, E.A. (Battelle Human Affairs Research Centers, Washington, DC (USA)). Nov 1987. Contract AC06-76RL01830. 39p. (BHARC—800/87/027). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007883/JAW.

This report focuses on measures of supply and demand for key facilities and services and provides a summary of 1985 conditions in education (public schools and libraries), public safety (police and sheriff, correction facilities, courts, and fire departments), health care and social services, and infrastructure (streets and roads, water and waste, and parks and recreation). These facilities and services are provided by public entities for use by the general public. In most cases, the providing agencies are funded by tax dollars and governed by elected representatives. As is generally demonstrated in this section none of the areas presented reveals demands for facilites and services in excess of current supply. In the area of education, the study area is providing service slightly above the state average by spending $1812 per pupil for certificated staff salaries (the state average is $1789), and enrollment levels are below capacity. Public safety also appears to be adequately covered with approximately 1.5 police officers per 1000 people and 0.75 fire fighters per 1000 people. One potential concern is that the Benton County correctional facility is currently being run at its capacity level. Health facilites, with the major hospitals operating at less than half capacity, appear to be adequate to meet the needs of the population. Infrastructure also appears to be adequate. Water and waste facilities have been expanded in recent years. However, this report is based on data for a single year and does not include historical trends. As the monitoring program continues, historical data will be collected and presented in order to put the information presented here in an historical perspective. 55 refs., 4 figs., 12 tabs.

35845 **(PNL—6390) Interim housing conditions profile, Benton and Franklin Counties, Washington: BWIP Repository Project: Working draft.** Bolton, P.A. (Battelle Human Affairs Research Centers, Washington, DC (USA)). Nov 1987. Contract AC06-76RL01830. 34p. (BHARC—800/87/026). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88007984/JAW.

This report describes the housing stock and its availability in Benton and Franklin counties. Depending on the specific measures, data are presented for the entire MSA, for Benton and Franklin counties separately, for incorporated and unincorporated areas within the counties, and for specific incorporated areas. The most detailed data are available for the two counties and for the major cities of Kennewick and Richland in Benton County and Pasco in Franklin County. In 1986, 64 percent of the population of Benton County and 66 percent of the housing units were in Kennewick and Richland. Seventy-three percent of the population and 75 percent of the housing were in the incorporated area of Benton County. In Franklin County, Pasco accounted for 52 percent of the county's 1986 population and 57 percent of its housing. Fifty-nine percent of the population and 63 percent of the housing were in the incorporated areas of Franklin County. More detailed data are needed to fully describe the housing conditions in the jurisdictions described here. 13 refs., 9 tabs.

35846 **(PNL—6497) Water quality: Historic values and impact of drilling activities during FY 1988 at the reference repository location in southeastern Washington.** Eddy, P.A.; Teel, S.S.; Raymond, J.R.; Bierschenk, W.H. (Pacific Northwest Lab., Richland, WA (USA)). Mar 1988. Contract AC06-76RL01830. 57p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88008068/JAW.

The purpose of the Environmental Monitoring Program was to monitor the characterization activities related to the Basalt Waste Isolation Project (BWIP) at boreholes DC-24CX and DC-25CX and document any environmental impacts as a result of these activities including contamination and/or degradation of the aquifer water quality from the invasion of drilling fluids into the formation and surface contamination from the disposal of drilling fluid at the land surface. The first phase of this program involved describing the baseline water quality at the Reference Repository Location (RRL) including data for spring and surface waters, and both the

unconfined and confined aquifers. The second phase involved the collection and analysis of samples collected during drilling operations at wells DC-24CX and DC-25CX. Five surface water and 25 spring sampling sites were designated for chemical and radiological background data collection for BWIP. Chemical and radiological background data from 61 wells that obtain water from the unconfined aquifers indicate that the chemistry of these aquifers is similar to the spring and surface water samples. However, some of the wells show contamination from existing operations and past operations of various facilities on the Hanford Site. These contaminants are both chemical and radiological in nature with nitrate as the primary chemical constituent and tritium as the major radiological constituent. 20 refs., 9 figs., 8 tabs.

35847 **(PNL—6499) BWIP [Battelle Waste Isolation Program] Repository Project: Interim fiscal profile, Benton and Franklin counties, Washington: Working draft.** Dong, F.B.; Dugan, M.K.; Clark, D.C. (Battelle Human Affairs Research Center, Seattle, WA (USA)). Feb 1988. Contract AC06-76RL01830. 65p. (BHARC—800/87/028). NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88008056/JAW.

This report presents a fiscal profile of Benton and Franklin counties, and of the cities of Richland, Kennewick, and Pasco. Overall, changes in operating revenues and expenditures in these jurisdictions have corresponded with changes in the local economy. The combined operating expenditures of Benton County, Franklin County, Kennewick, Pasco, and Richland, expressed in current dollars, tripled between 1975 and 1985, increasing from $18.1 million to $55.0 million, an annual average increase of 11.8 percent. During this time, the population of the Benton-Franklin MSA increased from 100,000 to 140,900 people, and the national all-items price index for urban consumers doubled, increasing from 161.2 to 322.2. Adjusted for inflation, per capita expenditures by these governments increased only slightly during this period, from $361.8 in 1975 to $390.3 in 1985. Employment in the Benton-Franklin MSA rose from 40,080 workers in 1970 to a peak of 75,900 in 1981 before declining to 61,100 in 1985, primarily due to the loss of 9,928 jobs in the Washington Public Power Supply System after 1981. The MSA's population followed a similar trend, with a slight lag. In 1970, total population in the Benton-Franklin MSA was 93,356 people. The MSA's population grew rapidly during the late 1970s, reached a peak of 147,900 persons in 1982, and then declined to 139,300 in 1986. 23 refs., 16 figs., 14 tabs.

35848 **(PNL—6505) Project characteristics monitoring report: BWIP [Basalt Waste Isolation Program] repository project.** Friedli, E.A.; Herborn, D.I.; Taylor, C.D.; Tomlinson, K.M. (Battelle Human Affairs Research Center, Seattle, WA (USA)). Mar 1988. Contract AC06-76RL01830. 64p. (BHARC—800/88/004). NTIS, PC A04;3. Order Number DE88010588/JAW.

This monitoring report has been prepared to show compliance with provisions of the Nuclear Waste Policy Act of 1982 (NWPA) and to provide local and state government agencies with information concerning the Basalt Waste Isolation Program (BWIP). This report contains data for the time period May 26, 1986 to February 1988. The data include employment figures, salaries, project purchases, taxes and fees paid, worker survey results, and project closedown personal interview summaries. This information has become particularly important since the decision in December 1987 to stop all BWIP activities except those for site reclamation. The Nuclear Waste Policy Amendments Act of 1987 requires nonreclamation work at the Hanford Site to stop as of March 22, 1988. 7 refs., 6 figs., 28 tabs.

35849 **(PNL—6541) An interim evaluation of the thermal stability of Cu--Y--^{85}Kr sputter deposits and plans for evantual disposal.** McClanahan, E.D.; Bradley, E.R. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. Contract AC06-76RL01830. 23p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010330/JAW.

A pilot process was developed and demonstrated for trapping and storing ^{85}Kr from the dissolver off-gas stream of a nuclear fuel reprocessing plant. Ions produced in a low-pressure krypton discharge are implanted on the inner wall of a krypton trapping storage device (KTSD). Objectives were to measure the release of ^{85}Kr implanted in a copper--yttrium alloy, outline the characterization work to be performed on the Cu{endash}Y{endash}^{85}Kr waste form, and identify the options available for disposing of the remaining ^{85}Kr. Release rates were obtained from periodic measurements of the krypton released from both radioactive and nonradioactive krypton-loaded KTSDs. Sampling is expected to continue as long as the extrapolated release rates remain acceptable for a period not to exceed one half-life ({approximately}10 y). Seven tests were performed on a nonradioactive KTSD at 180 to 450{degree}C. Three KTSDs loaded with 80 to 150 Ci of ^{85}Kr stored at 150, 250, and 350{degree}C were sampled four times each. Proposed post-elevated-temperature storage characterization of the Cu{endash}Y{endash}^{85}Kr waste form is outlined. Both radioactive and nonradioactive test specimens stored below 350{degree}C showed release rates less than 0.1%y/sup {minus}1/. Release rates for the radioactive specimens were obtained for storage periods of 1.6, 1.1, and 0.4 y at 150, 250 and 350{degree}C. The nonradioactive specimen has been held at temperatures between 180 and 450{degree}C, but mainly at 350{degree}C for a total storage time of 2.1 y. Tests should continue for a period not exceeding 10 y, and then the remaining Cu{endash}Y{endash}^{85}Kr waste form should be evaluated to better predict the overall stability. Three options for the disposal of the remaining ^{85}Kr. 3 refs., 2 figs., 2 tabs.

35850 **(PNL-SA—15143) Validation of a nuclear waste repository performance assessment model: Comparison of theory with experiment.** Geldart, R.W.; McGrail, B.P.; Rhoads, K.; Apted, M.J. (Pacific Northwest Lab., Richland, WA (USA)). Mar 1988. Contract AC06-76RL01830. 10p. (CONF-871124—96). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008178/JAW.

From Fall meeting of the Materials Research Society; Boston, MA, USA (30 Nov 1987).

Laboratory tests were conducted to validate a radionuclide mass transfer model. During the experiments, cesium and uranium releases from a simulated waste form embedded in an isotropic medium of quartz sand were measured. A 0.01 {und M} NaH_2PO_4 buffer solution flowed past the waste form. Downstream concentrations obtained from computer simulations were compared with experimentally measured concentrations of cesium and uranium. Uranium release was found to be controlled by solubility-limited mass transfer, while cesium releases was controlled by waste form dissolution kinetics. It was also found that the effects of dissolution on groundwater chemistry must be coupled with solubility-limited mass transfer models to defensibly predict radionuclide release rates under realistic repository conditions. 10 refs., 6 figs.

35851 **(PNL-SA—15403) Analysis of congruent matrix release, precipitation, and time-distributed containment failure on spent fuel performance.** Apted, M.J.; Engel, D.W. (Pacific Northwest Lab., Richland, WA (USA)). Mar 1988. Contract AC06-76RL01830. 11p. (CONF-871124—95). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008177/JAW.

From Fall meeting of the Materials Research Society; Boston, MA, USA (30 Nov 1987).

The Analytical Repository Source-Term (AREST) code has been developed for source-term evaluation of spent fuel as a final waste form in geologic repositories. AREST contains a set of analytical equations for the time-dependent diffusional mass transport of both solubility-limited and inventory-limited radionuclides from a spent fuel in a failed container surrounded by a shell of packing or other porous material imbedded in a porous host rock. Three factors that affect release performance are congruent dissolution of the UO_2 matrix: chemical instability of the UO_2 matrix, with precipitation of a more stable uranium phase within the waste package: and the attenuation of release rate by distribution of containment failures with time. For congruent matrix dissolution, the release rates of included nuclides are proportional to the product of solubility-limited release of uranium and the fractional abundance of the nuclide. For certain conditions, congruent release rates are calculated to be up to 10 orders of magnitude lower than release rates assuming individual solubility-limits. Precipitation of a more stable, lower solubility uranium phase within the waste package is shown to in-

crease release rates from the UO_2 matrix compared to the non-precipitation case, in agreement with previous calculations. During the first 300 to 1000 years after repository closure, the distribution of containment failures with time will act to attenuate the peak average release rates of soluble, long-lived nuclides, such as iodine-129, to values smaller than release rates below regulatory limits. 27 refs., 5 figs.

35852 **(PNL-SA—15574) Update on the Hanford waste vitrification plant technical developments.** Scott, J.L.; Wolfe, B.A.; Allen, C.R.; Bates, S.O. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1988. Contract AC06-76RL01830. 8p. (CONF-880201—40). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011899/JAW.

From Waste management '88: symposium on radioactive waste management; Tucson, AZ, USA (26 Feb 1988).

The US Dept. of Energy (DOE) program to dispose of defense high-level waste is formally described in the Defense Waste Management Plan submitted to Congress in 1983. This plan outlines the strategy of sequencing the disposal efforts at the three DOE sites that have high-level wastes: Savannah River, Hanford Site, and Idaho. Sequencing the effort will enable the Hanford Site to take advantage of the development work and operating experience gained at the Savannah River site.

35853 **(PNL-SA—15579) West Valley glass product qualification durability studies: Effects of composition, redox state, heat treatment, and groundwater.** Reimus, M.A.H.; Piepel, G.F.; Mellinger, G.B. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1988. Contract AC06-76RL01830. 21p. (CONF-880354—6). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008201/JAW.

From Waste management '88; Tucson, AZ, USA (1 Mar 1988).

Pacific Northwest Laboratory is examining the effects of composition, ferrous/ferric ratio (redox state), heat treatment, and groundwater on the chemical durability of a glass proposed for solidification of West Valley nuclear waste. Several experiments have been conducted, and preliminary results are given in this paper. The results of the experiments conducted to date indicate that waste glass is more durable in groundwater than in deionized water; also, durability is affected by isothermal and simulated canister cooling heat treatments. However, the durability of the waste glass is not strongly affected by the variation of glass redox state. Linear mixture models were fitted to the glass compositional variation data and validated. These models may be used to predict the effects of varying specific components on the reference glass durability within the defined composition region. 12 refs, 6 figs, 4 tabs.

35854 **(PNL-SA—15631) Recent developments in technology for recovery/purification of selected byproducts.** Bray, L.A.; Jensen, G.A. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1988. Contract AC06-76RL01830. 15p. (CONF-880201—38). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009476/JAW.

From Waste management '88: symposium on radioactive waste management; Tucson, AZ, USA (26 Feb 1988).

For over three decades, US interest in recovery, purification, and application of selected nuclear byproducts (e.g., ^{137}Cs, ^{90}Sr, ^{85}Kr, ^{241}Am, ^{147}Pm, etc.) has remained at a high level. Such interest in byproduct separation and utilization has been sustained even though no irradiated commercial light water reactor fuel, a prime source of such byproducts, has been reprocessed in the US since 1972. This paper briefly reviews and summarizes some recent work at several US Department of Energy (DOE) sites concerning recovery and purification of ^{153}Gd, ^{241}Am, noble metals, and certain other potentially useful and valuable radioactive byproducts.

35855 **(RFP—4212) Development of a trial burn plan for a mixed waste fluidized bed incinerator.** Kabot, F.J.; Ziegler, D.L. (Weston (Roy F.), Inc., Lakewood, CO (USA); Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 1988. Contract AC04-76DP03533. 14p. (CONF-880679—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008051/JAW.

From 81. annual meeting of Air Pollution Control Association; Dallas, TX, USA (1 Jun 1988).

One of the more important elements of the incinerator permitting process under RCRA is the development of the Trial Burn Plan. This document describes the incinerator and defines the incinerator's process envelope within which the trial burns will be conducted. The data obtained during the trial burns will be the basis for the incinerator's operating permit. This paper describes the development of the Trial Burn Plan for a unique fluidized bed incinerator to be used for the incineration of hazardous and mixed wastes at the Department of Energy's Rocky Flats Plant. It describes a review process of the Trial Burn Plan involving a public comment period that actually preceded the trial burns. 2 refs., 1 fig.

35856 **(SAND—84-2624) Waste disposal performance assessment using attenuation factors.** Klett, R.D. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1988. Contract AC04-76DP00789. 54p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88011765/JAW.

This report defines the requirements for waste disposal performance assessment (PA) methods in general and discusses specific requirements for subseabed nuclear waste disposal. Processes in waste disposal systems are discussed, concentration on characteristics pertinent to PA. The attenuation factor method of PA is developed based on retardation, pulse spreading, dilution, and dispersion processes. This method computes the reduction of risk potential made by each component of the system. Mathematical models for deterministic and probabilistic analyses along with several examples are given. Uses and limitations of the method are discussed. Although the attenuation factor method of PA was developed for the disposal of nuclear waste, it can be adapted to the disposal of nonnuclear hazardous wastes. 16 refs., 14 figs., 3 tabs.

35857 **(SAND—86-7000) Effective continuum approximation for modeling fluid and heat flow in fractured porous tuff: Nevada Nuclear Waste Storage Investigations Project.** Pruess, K.; Wang, J.S.Y.; Tsang, Y.W. (Lawrence Berkeley Lab., CA (USA)). May 1988. Contract AC04-76DP00789. 100p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88010969/JAW.

Fluid and heat flow in ffractured porous media can be great complexity, and a quantitative description requires the development of simplified mathematical and numerical methods. This report presents a detailed formulation, and partial evaluation, of an "effective continuum approximation" for non-isothermal multi-phase flow, which had been introduced previously only in a heuristic fashion. The key concept on which the effective continuum approach must rely is (approximate) local thermodynamic equilibrium between fractures and rock matrix. The applicability of this approximation is discussed and studied by means of numerical simulations for emplacement of high-level waste packages in partially saturated fractured tuff. The simulations demonstrate that the validity of the effective continuum approximation cannot be ascertained in general terms. The approximation will break down for rapid transients in flow systems with low matrix permeability and/or large fracture spacing, so that its applicability needs to be carefully evaluated for the specific processes and conditions under study. The effective continuum approximation has been applied for a preliminary study of fluid and heat flow near a high-level nuclear waste repository on a regional scale, employing a highly simplified strtatigraphic description. It was found that substantial gas phase convection was taking place, with convection velocities being sensitive to permeability, porosity, and tortuosity of the fracture network. 18 refs., 27 figs., 7 tabs.

35858 **(SAND—87-3083) Preliminary seal design evaluation for the Waste Isolation Pilot Plant.** Stormont, J.C. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1988. Contract AC04-76DP00789. 67p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88008976/JAW.

This report presents a preliminary evaluation of design concepts for the eventual sealing of the shafts, drifts, and boreholes at the Waste Isolation Pilot Plant Facility. The purpose of the seal systems is to limit the flow of water into, through, and out of the repository. The principal design strategy involves the consolidation of crushed or granular salt in response to the closure of the excavations in salt. Other candidate seal materials are bentonite, cementi-

tious mixtures, and possibly asphalt. Results from in situ experiments and modeling studies, as well as laboratory materials testing and related industrial experience, are used to develop seal designs for shafts, waste storage panel entryways, non-waste containing drifts, and boreholes. Key elements of the ongoing experimental program are identified. 112 refs., 25 figs., 1 tab.

35859 **(SAND—88-0054C) An analysis of crud contribution to the maximum permissible release rates for reactor spent fuel shipments.** Sandoval, R.P.; Sanders, T.L.; Einziger, R.E.; Malinauskas, A.P.; Mings, W.J. (Sandia National Labs., Albuquerque, NM (USA); Pacific Northwest Lab., Richland, WA (USA); Oak Ridge National Lab., TN (USA); Idaho National Engineering Lab., Idaho Falls (USA)). 8 Jan 1988. Contract AC04-76DP00789. 7p. (CONF-880601—20; TTC—0772). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88005697/JAW.

From American Nuclear Society annual meeting; San Diego, CA, USA (12 Jun 1988).

The Office of Civilian Radioactive Waste Management is sponsoring a program to develop standardized methodologies for evaluating spent fuel source terms and demonstrating compliance of spent fuel shipping packages to the federal containment requirements. An important subtask of the program is the evaluation of the neutron-activated corrosion-product deposits (i.e., "crud") on irradiated fuel rod surfaces and the determination of the contribution of these "crud" deposits to the total activity available for release from cask containment. During transportation, crud may spall from the fuel rods, disperse and become suspended in the cavity medium (gas or liquid), and could be the major contributor to the total source term. An analysis of all available data on crud deposit activity concentration distributions, composition, spallation properties, particle size distribution, and crud friability was conducted for various light-water-reactor fuels for selected burnups and decay times. Assuming that crud is the only source of activity release, the maximum permissible leakage rates were estimated using these data for seven types of truck and rail shipping casks containing 1-year-cooled and 10-year-cooled spent fuel. The details and results of this analysis are presented in this paper. 2 refs.

35860 **(SAND—88-0844) Summary report for the WIPP [Waste Isolation Pilot Plant] technology development program for isolation of radioactive waste.** Tyler, L.D.; Matalucci, R.V.; Molecke, M.A.; Munson, D.E.; Nowak, E.J.; Stormont, J.C. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1988. Contract AC04-76DP00789. 303p. NTIS, PC A14/MF A01;1; GPO Dep. Order Number DE88009866/JAW.

The technology experiments have been managed in three broad categories: Thermal/Structural Interactions (TSI), Plugging and Sealing Performance and Design (P&S), and Waste Package Performance (WPP). The history and major progress in each of these areas is summarized in this report. The TSI program has established the fact that the WIPP salt creep rate, and therefore closure of WIPP rooms, is about three times more rapid than our best models predicted prior to the tests. Studies to resolve this discrepancy are well advanced; in the interim, good agreement between predicitions and observation is obtained by empirical adjustment of the elastic constants. The closure of backfilled waste room to about five percent void volume is predicted to take less than 100 years, the time during which active controls may be assumed to prevent human intrusion. The waste package program has revealed that migration of interstitial brine to excavations in the WIPP salt occurs at a significantly greater rate than assumed by earlier investigations. A satisfactory model to explain the data utilizes darcy flow in very low permeability salt which is driven by a pore pressure gradient caused when the excavation creates an atmospheric pressure boundary. This model, coupled with room closure predictions and backfill design using a salt/bentonite clay mixture, indicates that the rate of brine seepage will not result in a fluid or slurry state in the room, but rather in a compacted solid. 373 refs., 20 figs., 9 tabs.

35861 **(SKN—17-Vol.1) Technical and socio-political issues in radioactive waste disposal 1986. Vol. 1. Safety, siting and interim storage.** Parker, F.L.; Kasperson, R.E.; Andersson, T.L.; Parker, S.A. (National Board for Spent Nuclear Fuel, Stockholm (Sweden); Beijer Inst., Stockholm (Sweden)). Nov 1987. 201p. NTIS (US Sales Only), PC A10/MF A01. Order Number DE88753587/JAW.

The purpose of the study was to provide an integrated technical and socio-political analysis of how six countries (Federal Republic of Germany, France, Sweden, Switzerland, United Kingdom and the United States of America) have responded to four key issues in radioactive waste management: a) What constitutes 'safe' or 'absolutely safe' disposal, b) site selection processes, c) timing and type of interim storage.

35862 **(UCID—21139) Underground research laboratory grout trials: Geotomography results.** Ramirez, A.L.; Daily, W.D. (Lawrence Livermore National Lab., CA (USA)). Nov 1987. Contract W-7405-ENG-48. 17p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011758/JAW.

As part of a grouting test at the Atomic Energy of Canada Limited Underground Research Laboratory, Lawrence Livermore National Laboratory conducted an electromagnetic tomography experiment to evaluate the potential of the technique to detect grout invasion. Changes of the electromagnetic attenuation rate of the rock were detected within the highly permeable altered region of a fracture zone after a jet washing-grouting process was completed. The attenuation rate was observed to decrease near grout hole GH1 and increase near grout hole GH2. The quantity of material removed from the fracture zone by jet washing, as well as the quantity of grout accepted by each borehole was different. It is possible that the observed difference in electromagnetic response at the two locations is dependent upon both grout invasion and the amount of infilling material removed by the jet washing process. The spatial distribution of the changes in attenuation rate near GH1 and GH2 correlate well with the location of the highly permeable region on the fracture zone and with locations where jet washing removed fracture infilling material. 9 refs., 4 figs.

35863 **(UCRL—21010) Well development and hydraulic testing at LLNL (Lawrence Livermore National Laboratory) Site 300, Building 830, 834, 840 and GSA areas.** (Weiss Associates, Oakland, CA (USA)). Mar 1988. Contract W-7405-ENG-48. 71p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88009070/JAW.

Well development was conducted on 17 monitor wells in the southeast part of Site 300. Seven wells exhibited some increase in flow or recovery rates, and most wells showed some decrease in water turbidity andor sediment content. Further development of these wells would probably not significantly increase well yields. Hydraulic testing was performed on 19 monitor wells in the southeast part of Site 300. Seventeen of the wells were successfully tested using constant-discharge pumping test or slug tests. Hydraulic conductivity ranged from 0.04 to 94 gpdft^2. Hydraulic conductivity greatly varied with well location and screened depth, which is consistent with the fractured and heterogeneous geologic environment of the Site 300 area. Remediation by ground water extraction does not appear feasible in the perched ground water in the shallow alluvium, conglomerate, and sandstone of the Building 834 area. The wells within the sandstones of the General Services Area suport moderate flow rates and may be suitable for ground water extraction, if necessary. In general, the ability to support extractable flow rates is dependent on the locations and orientations of fractures, which are not presently known. Identifying fractures by surface mapping and exploratory drilling is recommended if ground water extraction is desired. However, identificaion of fracture orientation and spacing may be difficult and costly.

35864 **(UCRL—21044-Vol.3) Waste minimization study for the Lawrence Livermore National Laboratory: Lead.** (Bechtel National, Inc., San Francisco, CA (USA)). 31 Jul 1987. Contract W-7405-ENG-48. 190p. NTIS, PC A09;3. Order Number DE88009073/JAW.

Bechtel National, Inc. contracted with the Lawrence Livermore National Laboratory (LLNL) to provide support for a Waste

Minimization Program. Reports were delivered to the Laboratory at the end of the contract period. The contract was extended to include work to minimize solvent wastes. During this extension period, the Minimization Team was asked to prepare a report officially titled {open←quotes}Lead Integrated Management Program (LIMP){close←quotes} in reply to a request by the Department of Energy. At that time, the decision was reached to provide a Lead Waste Minimization Study in a parallel effort to the LIMP report since the research and data base is common to both. In fact, the LIMP report is attached and is referred to extensively in the course of the Minimization Study. The Lead Study replaces one of the three final solvent reports specified as deliverables under the Contract extension.

35865 **(UCRL—21046) Geotechnical investigation for a Decontamination and Waste Treatment Facility, Lawrence Livermore National Laboratory, Livermore, California.** (Lawrence Livermore National Lab., CA (USA); Bechtel National, Inc., San Francisco, CA (USA)). Jul 1986. Contract W-7405-ENG-48. 95p. NTIS, PC A05;3. Order Number DE88011319/JAW.

This report presents the results of the geotechnical investigation performed for a proposed Decontamination and Waste Treatment Facility (DWTF) at the Lawrence Livermore National Laboratory (LLNL) in Livermore, California. The site is located in the northeast corner of the LLNL complex. The purpose of the study was to investigate the subsurface conditions and evaluate the suitable foundation types for the proposed construction. This report presents a description of the soil and ground water conditions encountered during the field exploration; an analysis and evaluation of the laboratory test data obtained; and the recommendations for the design and construction of foundations for the proposed structures. The drilling and laboratory testing were performed, respectively, by LLNL subcontractors, Pitcher Drilling and Berlogar Geotechnical Consultants. 6 refs.

35866 **(UCRL—97450) Tritium storage in ion-exchanged zeolites.** Maienschein, J.L.; McMurphy, F.E.; Uribe, F.S. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 23p. (CONF-880505—26). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011314/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

Cesium-exchanged Type 4A zeolites can encapsulate high-pressure tritium by physical entrapment in interior pores. We present data on storage capacity related to physical pore volume in the zeolite, and show that storage stability is reasonably good for short periods. Our data also shows that the zeolite releases helium while retaining tritium. Results are analyzed in terms of a diffusion model in the literature. The zeolite showed no structural change after a radiation dose of 10^8Gy; it is unclear if radiation affects storage stability. 22 refs., 4 figs., 2 tabs.

35867 **(USGS/MAP/I—1826) Surficial geologic map of the Bare Mountain quadrangle, Nye County, Nevada.** Swadley, W.C.; Parrish, L.D. (Geological Survey, Denver, CO (USA)). 1988. Contract AI08-78ET44802. 13p. US Geological Survey, Box 25425, Denver Federal Center, Denver, CO 80225. Order Number TI88010248/JAW.

35868 **(WHC-SA—0183) Radionuclide release behavior of light water reactor spent fuel under hydrothermal conditions.** Neal, W.L.; Rawson, S.A.; Murphy, W.M. (Westinghouse Hanford Co., Richland, WA (USA)). Dec 1987. Contract AC06-87RL10930. 13p. (CONF-871124—102). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011949/JAW.

From Fall meeting of the Materials Research Society; Boston, MA, USA (30 Nov 1987).

The Basalt Waste Isolation Project has performed initial characterization of the release behavior of radionuclides from ATM-101 spent fuel reacted under hydrothermal conditions. Results to date indicate that (1) ^{14}C, ^{90}Sr, ^{129}I, and ^{137}Cs exhibit preferential release to solution relative to the actinides, (2) /sup 239+240/Pu, ^{241}Am, and ^{244}Cm ratios in solution are consistent with stoichiometric dissolution of the spent fuel matrix, whereas uranium concentrations are higher than those predicted for stoichiometric dissolution, (3) ^{137}Cs release varies as a function of the fluid to solid mass ratio, and (4) ^{14}C, ^{129}I, and ^{137}Cs release is affected by fuel particle size and/or fuel washing.

35869 **Treatment and disposal of tritium containing waste at Mound.** Rogers, M.L. (Monsanto Research Corp., Miamisburg, OH (USA). Mound Facility). *Fusion Engineering and Design;* **5**: No. 4, 415-419(Jan 1988). Contract AC04-76DP00053.

First generation fusion machines will burn the hydrogen isotopes deuterium and tritium as fuel. Tritium, which is radioactive, must be handled carefully and any byproducts must be disposed of as radioactive waste. Tritiated waste will fall into one of three categories: gaseous, liquid, or solid. Sources and expected quantities of tritiated waste that are likely to be generated by a fusion machine will be discussed. Strategies, options and processes for dealing with tritium containing wastes will also be presented. Final disposition of each category of tritium contaminated waste is governed by regulations and guidelines. These regulations and guidelines, and how they might apply to a fusion reactor facility, will be outlined.

35870 **The formation of surface layers and reaction products in the leaching of defense borosilicate nuclear waste glass.** Harker, A.B.; Flintoff, J.F. (Rockwell International Science Center, 1049 Camino Dos Rios, P.O. Box 1085, Thousand Oaks, CA (US)). *Nuclear Technology;* **76**: No. 2, 263-278(Feb 1987).

The development of surface alteration layers and solid products in the reaction of borosilicate nuclear waste glass with aqueous solutions has been studied as a function of time, surface morphology, water flow rates, and solution composition. A physical description of the growth of the surface layers has been developed, and several solid reaction products have been identified. The results of the study support a saturation based description of long-term radionuclide release from glass waste forms and demonstrate the complex dependence of short-term leaching experiments upon both surface and solution variables.

35871 **Statistical process control: An approach to quality assurance in the production of vitrified nuclear waste.** Pulsipher, B.A.; Kuhn, W.L. (Pacific Northwest Lab., Richland, WA 99352 (US)). pp 483-488 of Waste management '87: Waste isolation in the US, technical programs, and public education. Post, R.G. Tucson, AZ; University of Arizona Nuclear Engineering Dept. (1987). (CONF-870306—). Contract AC06-76RL01830.

From Waste management '87; Tucson, AZ, USA (1 Mar 1987).

Current planning for liquid high-level nuclear wastes existing in the United States includes processing in a liquid-fed ceramic melter to incorporate it into a high-quality glass, and placement in a deep geologic repository. The nuclear waste vitrification process requires assurance of a quality product with little or no final inspection. Statistical process control (SPC) is a quantitative approach to one quality assurance aspect of vitrified nuclear waste. This method for monitoring and controlling a process in the presence of uncertainties provides a statistical basis for decisions concerning product quality improvement. Statistical process control is shown to be a feasible and beneficial tool to help the waste glass producers demonstrate that the vitrification process can be controlled sufficiently to produce an acceptable product. This quantitative aspect of quality assurance could be an effective means of establishing confidence in the claims to a quality product.

35872 **Hydrogen absorption and crevice corrosion behavior of Ti Grade 12 during exposure to irradiated brine at 150°C.** Westerman, R.E.; Telander, M.R. (Pacific Northwest Lab., Richland, WA 99352 (US)). pp 463-470 of Waste management '87: Waste isolation in the US, technical programs, and public education. Post, R.G. Tucson, AZ; University of Arizona Nuclear Engineering Dept. (1987). (CONF-870306—). Contract AC06-76RL01830.

From Waste management '87; Tucson, AZ, USA (1 Mar 1987).

The Ti Grade 12 alloy is being considered for use as a corrosion-resistant overpack for high-level nuclear waste packages in a salt repository. Two experiments performed at Pacific Northwest Laboratory (PNL) were directed toward determining this material's resistance to hydrogen absorption and crevice corrosion during exposure to concentrated anoxic NaMgK chloride brines at 150°C under conditions of gamma irradiation. At an irradiation intensity of 2 x 10^4 radhr, the hydrogen absorption rate of Ti Grade 12 specimens was low, and appeared to stop entirely after six months. Grit-blasted specimens absorbed considerably more hydrogen than as-received sheet stock specimens. Crevice corrosion was observed between specimen spacers and between (purposefully) contacting specimens. The observed crevice corrosion susceptibility must be taken into account when considering the Ti Grade 12 alloy as a candidate waste package overpack material.

35873 **(IAEA-SM—303/134) Overview of mixed waste issues at the Department of Energy defense installations.** Mezga, L.J.; Eisenhower, B.M. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 18p. (CONF-880510—2). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010141/JAW.

From International symposium on the management of low and intermediate level radioactive wastes; Stockholm, Sweden (16 May 1988).

Due to the {open+-quotes}double hazard{close+-quotes} associated with these waste materials, the ability to manage these mixed wastes has been somewhat limited. The unavailability of acceptable and proven treatment and/or disposal systems has forced the Department of Energy (DOE) installations to place these materials in storage. The limited capacity of permitted storage areas and the desire to move forward in the overall waste management cycle have placed an increased emphasis on the need to develop treatment/disposal technologies for mixed wastes. Programs have been initiated by contractors who operate the DOE installations to provide the technical basis for selecting technologies to render these wastes nonhazardous through treatment by destroying the hazardous constituent, to separate the hazardous constituents from the radioactive constituents, to treat the wastes and place them in a form that will meet EPA requirements to be classified as nonhazardous, and to provide facilities for the disposal of wastes which cannot be changed into a nonhazardous form. These wastes include a variety of materials such as chlorinated solvents and waste oils contaminated with uranium or fission products, liquid scintillation wastes, and sludges from wastewater treatment plants contaminated with uranium or fission products. By volume, the largest mixed waste streams are the contaminated wastewater treatment sludges. Plans for the management of the major categories of mixed waste are presented below. More detailed information on plans for specific waste streams is presented in the paper.

35874 **(WINCO—1052) ICPP [Idaho Chemical Processing Plant] environmental monitoring report, CY-1986.** Krivanek, K.R. (Westinghouse Idaho Nuclear Co., Inc., Idaho Falls (USA)). Feb 1988. Contract AC07-84ID12435. 43p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009029/JAW.

Summarized in this report are the data collected through Environmental Monitoring programs conducted at the Idaho Chemical Processing Plant (ICPP) by the Environmental Engineering (EE) subsection of the Nuclear and Industrial Safety (N{ampersand}IS) Department. The EE Subsection completed a Quality Assurance Plan for Environmental Monitoring activities during the third quarter of 1986. Implementation of the Quality Assurance Plan has resulted in the implementation of the Environmental Protection Agency rules and guidelines pertaining to the collection, analyses, and reporting of environmentally related samples. Where no approved laboratory methods for analyses existed for radionuclides, currently used methods were submitted for the EPA approval. Tables summarize the volumes and radioactivity of effluents released from ICPP stacks and liquid release points. Figures provide graphic representation of cummulative airborne releases and depict cumulative liquid releases for the year. Graphs allow a comparison to be made of waste volume and activity released for the year. During 1986 6.93 E + 03 curies of activity were released from airborne and liquid emission points at the ICPP operations. Airborne releases to the atmosphere contributed 6.07 E + 01 curies and liquid effluent released to the Percolation Pond contributed 2.52 E + 02 curies. 23 figs., 14 tabs.

35875 **(DOE/ID/12584—22) Radiologic characterization of the Weldon Spring, Missouri, Remedial Action Site.** Marutzky, S.J.; Colby, R.; Cahn, L.S. (UNC Technical Services, Inc., Grand Junction, CO (USA)). Feb 1988. Contract AC07-86ID12584. 234p. (UNC/GJ-HMWP—4). NTIS, PC A11;1. Order Number TI88010901/JAW.

The US Department of Energy established the Weldon Spring Site Remedial Action Program in February 1985 to effect remedial action at the Weldon Spring Chemical Plant site and the Femme Osage Slough Vicinty Property. This radiologic characterization of the Weldon Spring Site was performed at the request of the DOE/Oak Ridge National Laboratory, Weldon Spring, because additional data were needed to complete the Environmental Impact Statement in compliance with the National Environmental Policy Act and because no broad data collection effort of radiologic contamination in the Chemical Plant area had been performed. The field work was conducted by UNC Geotech, operating contractor for the DOE/Grand Junction Projects Office, during the period April through July 1987. This report includes descriptions of the in-situ measurement methods, data reduction, sampling techniques, and sample analytical methods; and data summaries. The report is not meant to serve as an analysis of the information derived from the conduct of this characterization effort, but rather as a presentation of the scope of the field activity, the measurement methods, and a compendium of the sample results. 9 figs., 18 tabs.

35876 **(DOE/ID/12584—27) Environmental monitoring report on the US Department of Energy's inactive millsite facility, Monticello, Utah, for calendar year 1987.** (UNC Geotech, Grand Junction, CO (USA)). May 1988. Contract AC07-86ID12584. 36p. (UNC/GJ-HMWP—6). NTIS, PC A03;3. Order Number DE88011470/JAW.

The inactive Monticello Millsite is located in San Juan County, Utah, just south of the town of Monticello. Environmental monitoring at the site is funded by the Surplus Facilities Management Program (SFMP) and focuses on releases due to preexistent mill tailings. All contaminant discharges result from the leaching of uranium-mill-tailings-related elements by ground water and surface water, and from the release of radon gas and particulate matter into the atmosphere. Pathways facilitating the migration of contaminants from the Monticello site include ground water in the shallow alluvial aquifer underlying the inactive facility, surface water running across the site, and the surrounding atmosphere. Extensive measurement of radon contamination from the tailings piles was conducted during 1984, 1985, and to a lesser extent during 1986 and 1987. On-pile, site-boundary, and off-site atmospheric radon measurements, as well as on- and off-pile radon-flux measurements, were taken. Results of these measurements demonstrate that the EPA standard for radon emissions from inactive uranium processing sites is exceeded at all four tailings piles at the Monticello site. Air particulate monitoring was conducted during 1987 at two on-site locations and at one background location using high-volume Sierra-Anderson model 300 air particulate samplers. So that only the inhalable particles would be collected, 10-micron-size screens were added to the samplers. The maximum airborne concentrations of radium-226, thorium-230, and uranium were all several orders of magnitude below

the regulatory limits specified by DOE Order 5480.1. 22 refs., 5 figs., 9 tabs.

35877 (DOE/OR/00033—T405) A critical essay: Ten mile emergency planning zones, pro or con. MacDurmon, G.W. (Rutgers--the State Univ., New Brunswick, NJ (USA)). Dec 1987. Contract AC05-76OR00033. 44p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009042/JAW.

The NRC's current emergency planning regulations are based on source term data which has come into question. Indeed, many current models indicate that source terms can be calculated which are one or more orders of magnitude lower than those from WASH-1400. However, there remains a number of unresolved technical issues between the NRC and the Industry Downgraded Core Research Program (IDCOR) calculated source terms which presents a very large uncertainty for the determined values. In addition, there remains questions concerning the integrity of containment, and the emphasis which should be placed on operator intervention. These results have caused both the NRC and the APS to state that source terms cannot be lowered for all radionuclides and all nuclear power plants at this time. Data from NUREG-1150, along with the statements of other experts, do seem to demonstrate that evacuation, as a means of dose minimization, has been overemphasized under the current regulations. While an appropriate evacuation planning distance, specific to each plant, would vary according to a number of factors such as population density, available transportation, typical housing structures for shelter, type of plant containment, etc., current methods of emergency planning must also address these issues. In light of this and the dose estimates across the Emergency Planning Zone (EPZ), it would seem that detailed emergency plans out to ten miles which place an emphasis on evacuation are unnecessary from a health physics perspective, and bear heavy socioeconomic costs. 14 refs., 13 figs., 5 tabs.

35878 (DPST—86-204) Onsite radiation doses from postulated reactor accidents. Price, J. B. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 1986. Contract AC09-76SR00001. 15p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011675/JAW.

This report documents a study of the onsite dose from postulated reactor accidents. Radiation doses are calculated to the level of detail previously used for offsite dose estimates. The study includes the major accident scenarios that are analyzed in the Safety Analysis Report for SRP production reactors for wind speed and direction, topography, and release height appropiate to the SRP site. All exposures outside the reactor building assume personnel are outdoors and unshielded. 3 refs., 1 fig., 6 tabs.

35879 (INFO—0138) Derived surface contamination limits for the uranium mining and milling industry. Ching, S.H. (Atomic Energy Control Board, Ottawa, Ontario (Canada)). Oct 1984. 33p. (CONF-841016—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701919/JAW.

From International conference on occupational radiation safety in mining; Toronto, Ontario, Canada (15 Oct 1984).

Derived Surface Contamination Limits (DSCL) are proposed for the control of surface contamination at the work place for the uranium mining and milling industry. They have been derived by a method incorporating recent ICRP recommendations and consideration of the radiation exposure pathways of ingestion, inhalation and external irradiation of the basal layer of skin. A generalized DSCL of 10^5 Bqm^3 of beta activity is recommended for all contaminants likely to be found in uranium mine and mill workplaces except for fresh uranium concentrates. In the latter case, the DSCL is expressed in terms of alpha activity because the ratio of beta to alpha activities for fresh uranium concentrates is variable; the beta activity increases with the ingrowth of U-238 daughter products (Th-234 and Pa-234m) until secular equilibrium is re-established in about six months. A surface contamination limit of 10^4 Bqm^3 of beta activity is proposed for the release of non-porous materials and equipment with no detectable loose contamination to the public domain.

35880 (PNL-SA—15020) Analysis of radiation doses for a transportation system and its interface operations for commercial spent fuel. Schneider, K.J.; Ross, W.A.; Smith, R.I.; Wilmot, E.L. (Pacific Northwest Lab., Richland, WA (USA); USDOE, Washington, DC). Jul 1987. Contract AC06-76RL01830. 7p. (CONF-871102—4). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009484/JAW.

From International waste management conference; Kowloon, China (29 Nov 1987).

This paper gives the results of estimates of aggregated radiation doses to the affected public and workers in the US that would be associated with loading spent fuel at the reactors, transporting the spent fuel by truck and rail, and receiving and unloading the spent fuel at a deep geological repository. The estimates are for a postulated transportation-related system using current state-of-the-art technology, if employed in the high-level waste management system in the future, and the approximate dose reduction from some potential system improvements. The results of the study provide a starting point for the US Department of Energy (DOE) to develop an improved transportation system that is cost effective, safe, and results in low radiation doses. 4 refs., 1 figs., 5 tabs.

35881 (UCRL—98435) The atmospheric release advisory capability (ARAC): A federal emergency response capability. Dickerson, M.H.; Sullivan, T.J. (Lawrence Livermore National Lab., CA (USA)). Mar 1988. Contract W-7405-ENG-48. 16p. (CONF-880679—5). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011348/JAW.

From 81. annual meeting of Air Pollution Control Association; Dallas, TX, USA (1 Jun 1988).

The Atmospheric Release Capability (ARAC) is a Department of Energy (DOE)-sponsored emergency-response service set up to provide real-time prediction of the dose levels and the extent of surface contamination resulting from a broad range of possible occurrences (accidents, spills, extortion threats involving nuclear material, reentry of nuclear-powered satellites, and atmospheric nuclear tests) that could involve the release of airborne radioactive material. During the past decade, ARAC has responded to more than 150 real-time situations, including exercises. The most notable responses include the Three Mile Island accident in Pennsylvania, the Titan II missile accident in Arkansas, the reentry of the USSR's COSMOS-954 into the atmosphere over Canada, the accidental release of uranium hexafluoride from the Sequoyah Facility accident in Oklahoma, and, most recently, the Chernobyl reactor accident in the Soviet Union. ARAC currently supports the emergency-preparedness plans at 50 Department of Defense (DOD) and DOE sites within the US and also responds to accidents that happen elsewhere. Our ARAC center serves as the focal point for data acquisition, data analysis and assessments during a response, using a computer-based communication network to acquire real-time weather data from the accident site and the surrounding region, as well as pertinent accident information. Its three-dimensional computer models for atmospheric dispersion, MATHEW and ADPIC, digest all this information and produce the predictions used in accident assessment. 9 refs., 6 figs., 1 tab.

REFER ALSO TO CITATION(S) 35898, 36504, 36505, 38959

35982 (AAEC/E—657) Video imaging system and related control hardware for nuclear safeguards surveillance applications. Whichello, J.V. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). Mar 1987. 32p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702835/JAW.

A novel video surveillance system has been developed for safeguards applications in nuclear installations. The hardware was tested at a small experimental enrichment facility located at the Lucas Heights Research Laboratories. The system uses digital video techniques to store, encode and transmit still television pictures over the public telephone network to a receiver located in the Australian Safeguards Office at Kings Cross, Sydney. A decoded, reconstructed picture is then obtained using a second video frame store. A computer-controlled video cassette recorder is used auto-

matically to archive the surveillance pictures. The design of the surveillance system is described with examples of its operation.

35883 **(BNL—41120) An overview of holdup measurement technology.** Zucker, M.S. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 17p. (CONF-880352—4). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008812/JAW.

From INMM workshop on process holdup; Rockville, MD, USA (2 Mar 1988).

The origin of holdup, where it occurs in plants, and the methods of assay thus far found useful under conditions often found in nuclear fuel manufacturing installations are discussed.

35884 **(DP-MS—87-148) Statistical estimation of process holdup.** Harris, S.P. (Savannah River Lab., Aiken, SC (USA)). 1988. Contract AC09-76SR00001. 49p. (CONF-880352—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88006664/JAW.

From INMM workshop on process holdup; Rockville, MD, USA (2 Mar 1988).

Estimates of potential process holdup and their random and systematic error variances are derived to improve the inventory difference (ID) estimate and its associated measure of uncertainty for a new process at the Savannah River Plant. Since the process is in a start-up phase, data have not yet accumulated for statistical modelling. The material produced in the facility will be a very pure, highly enriched 235U with very small isotopic variability. Therefore, data published in LANL's unclassified report on Estimation Methods for Process Holdup of a Special Nuclear Materials was used as a starting point for the modelling process. LANL's data were gathered through a series of designed measurements of special nuclear material (SNM) holdup at two of their materials-processing facilities. Also, they had taken steps to improve the quality of data through controlled, larger scale, experiments outside of LANL at highly enriched uranium processing facilities. The data they have accumulated are on an equipment component basis. Our modelling has been restricted to the wet chemistry area. We have developed predictive models for each of our process components based on the LANL data. 43 figs.

35885 **(LA—11120-PR) Safeguards and security: Progress report, January-December 1986.** Smith, D.B. (comp.). (Los Alamos National Lab., NM (USA)). Mar 1988. Contract W-7405-ENG-36. 120p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88010473/JAW.

From January to December 1986, the Los Alamos Safeguards and Security Program was involved in the activities described in the first four parts of this report: Nuclear Facility Support, Security Development and Support, Technology Development, and International Support. Part 1 covers efforts of direct assistance to the Department of Energy (DOE) and includes consultation on materials accounting problems, development and demonstration of specialized techniques and instruments, and comprehensive participation in the design and evaluation of advanced safeguards systems. Part 2 treats activities aimed at the security of computer systems. Our focus was on continuing the activities of the Center for Computer Security, which provides the basis for encouraging and disseminating this emerging technology, and on the development and demonstration of secure computer systems. Part 3 describes the broad development efforts essential to continuing improvements in the practice of safeguards. Part 4 covers international safeguards activities, including both support to the International Atomic Energy Agency (IAEA) and bilateral exchanges. Activities that have other sponsors are reported in Part 5. The final part lists titles and abstracts of Los Alamos safeguards R and D reports, technical journal articles, and conference papers that were published in 1986. 97 refs., 70 figs., 16 tabs.

35886 **(LA—11229-MS) A new method of calibration and normalization for neutron detector families.** Menlove, H.O.; Stewart, J.E. (Los Alamos National Lab., NM (USA)). Apr 1988. Contract W-7405-ENG-36. 52p. (ISPO—287). NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010477/JAW.

A calibration and cross-reference is presented for passive and active neutron assay instruments. The method reduces and number of physical standards required to calibrate families of neutron detectors and also ties together much of the calibration information currently available. The basic approach is to carefully calibrate one member of the family (reference detector) over the complete mass range of interest. Other members of the family can be cross-referenced to the calibrated detector using a single sample or radioactive source. Calibration and cross-reference information is presented for the Inventory Sample Counter, High-Level Neutron Coincidence Counter. Active Well Coincidence Counter, and the Neutron Collar. 1 ref., 15 figs., 20 tabs.

35887 **(LA—11340-MS) Neutron multiplicity measurements during LINAC interrogation of safeguards accountable material.** Brunson, G.S.; Coop, K.L. (Los Alamos National Lab., NM (USA)). Jul 1988. Contract W-7405-ENG-36. 18p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012175/JAW.

The authors used a LINAC to interrogate some arbitrary sample arrays to learn if enriched uranium can be detected when it is embedded in depleted uranium and ^{6}LiD. Whether the interrogation is by bremsstrahlung or photoneutrons, the interrogating pulse causes fission in any uranium present, leaving delayed neutron precursors embedded wherever fissions have occurred. In the interval between LINAC pulses, we detected neutron multiplicities arising from ^{238}U fissions caused by delayed neutrons. Because almost all delayed neutrons have energies below the fission threshold of ^{238}U, a negligible number of fissions occur if ^{235}U is not present in quantity. We are able to detect a 1-kg cylinder of enriched uranium metal behind ~ 2.3 cm of depleted uranium metal and ~ 2.9 cm of ^{6}LiD. For this configuration, the threshold for detecting ^{235}U is ~ 1/3 kg. The results are sensitive to the shape of the uranium sample.

35888 **(LA-UR—88-1077) Methods and techniques of NDA (nondestructive assay).** Reilly, T.D. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 41p. (CONF-8804109—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009145/JAW.

From Regional training course on state systems of accounting for and control of nuclear materials; Rio de Janeiro, Brazil (11 Apr 1988).

Nondestructive assay (NDA) refers to techniques and instruments developed to measure nuclear materials in the many forms in which they occur throughout the fuel cycle. These techniques were first developed to support nuclear safeguards inspections and nuclear material accountability; they are also used extensively for process and quality control. Most accountability measurements are based on analytical chemistry and require that a sample be drawn and analyzed destructively. Destructive analysis can not be applied to many of the product materials found in the fuel cycle, such as fuel rods and assemblies, because of their high monetary value. Also, many waste and scrap materials can not be adequately sampled for destructive analysis because of their heterogenous nature. This situation led to the development of nondestructive analysis techniques. This paper presents an overview of the major NDA techniques and instrumentation in use today. The instrumentation described below is now used frequently by safeguards inspectors and facility operators alike. 19 refs., 18 figs., 4 tabs.

35889 **(NBL—318) [New Brunswick Laboratory]: Progress report for the period October 1986 through September 1987.** (USDOE New Brunswick Lab., Argonne, IL). Mar 1988. 82p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88009104/JAW.

This report summarizes the mission activities of the New Brunswick Laboratory (NBL) of the US Department of Energy (DOE). NBL's mission is to provide and maintain a nuclear material measurements and standards laboratory as a technical response to DOE's statutory responsibility to assure the safeguarding of nuclear materials.

35890 **(ORNL/TM—10814) An independent technique for fissile inventory verification of holding tanks in the nuclear fuel cycle status report.** Carter, J.A.; Smith, D.H.; Walker, R.L.; May, M.P. (Oak Ridge National Lab., TN (USA)). May 1988. Contract AC05-84OR21400. 15p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010765/JAW.

A technique for determination of the liquid volumes of solutions in holding tanks and for their fissile material content has been developed and tested. It is independent of the size of the tank, the fraction of full capacity occupied, and void volumes caused, for example, by build up of solid deposits or gas bubbles. Because the amount of spike added to the tank is accurately known, the inventory is also independent of solution volume and density. It involves use of isotope dilution mass spectrometry through application of a double spiking technique using lutetium. A known amount of natural lutetium is added to the subject tank. After thorough mixing, an aliquot of solution is withdrawn from the tank. A known amount of lutetium enriched in the 176 isotope is added to the aliquot. Mass spectrometric analysis and the technique of isotope dilution allow determination of the volume of liquid in the tank. The same aliquot used for volume determination can be used for assay of uraniuim and plutonium for both isotopic composition and concentration. This allows determination of total fissile weight contained in a given tank. 6 refs., 2 figs., 4 tabs.

35891 **(RFP—4200) Nuclear materials management overview.** DiGiallonardo, D.A. (Rockwell International Corp., Golden, CO (USA). Energy Systems Group). 1988. Contract AC04-76DP03533. 7p. (CONF-880631—6). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88010899/JAW.

From 29. annual meeting of the Institute of Nuclear Materials Management; Las Vegas, NV, USA (26 Jun 1988).

The true goal of Nuclear Materials Management (NMM) is the strategical and economical management of all nuclear materials. Nuclear Materials Management's role involves near-term and long-term planning, reporting, forecasting, and reviewing of inventories. This function is administrative in nature. It is a growing area in need of future definition, direction, and development. Improvements are required in program structure, the way residues and wastes are determined, how {open«-quotes}What is and what if{close«-quotes} questions are handled, and in overall decision-making methods. 2 refs.

35892 **(SAND—87-1642/i) An adaptable modular Safeguards Control and Communications System (SCCS) overview of the control and display subsystem.** Ortiz, S. (Sandia National Labs., Albuquerque, NM (USA)). Feb 1988. Contract AC04-76DP00789. 58p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88011275/JAW.

The Control and Display Subsystem is the functional heart of the Safeguards Control and Communications System (SCCS). This document provides an overview of the hardware, software, design features, and operating principles of the subsystem; the functional relationships between the subsystem and other SCCS subsystems are also discussed. Complete references are provided to vendors' literature and separate dedicated documents on various components of the subsystem. 4 figs., 6 tabs.

35893 **(SAND—87-1642/iii) An adaptable modular Safeguards Control and Communications System (SCCS) operator's manual.** Ortiz, S. (Sandia National Labs., Albuquerque, NM (USA)). Feb 1988. Contract AC04-76DP00789. 104p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88010970/JAW.

This document provides detailed operating instructions for the Safeguards Control and Communications System (SCCS). The SCCS is an automated electronics surveillance system that uses electrical sensors and a closed-circuit television (CCTV) system to enable a central security operator to monitor site security. In order to provide a basis for the operating instructions that follow, the manual begins with a description of the system hardware, concentrating on the hardware at the SCCS operator's console. The manual then provides detailed operating instructions for both normal and emergency operating conditions. 8 figs., 2 tabs.

35894 **(SAND—88-0290C) High bandwidth real time frequency modulated (FM) video link for security and tactical applications.** Lupinetti, F. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 9p. (CONF-880631—8). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011484/JAW.

From 29. annual meeting of the Institute of Nuclear Materials Management; Las Vegas, NV, USA (26 Jun 1988).

With the increasing demand for in situ unmanned reconnaissance, security control, and intrusion detection, the capability of transmitting and receiving video information from remote locations has become of paramount importance. This capability can be achieved by appropriately deploying radio frequency (RF) video links which can readily be interfaced with sensors, humans, or other RF links. The video link described in this paper was designed and implemented for security and tactical applications which require a medium power, low complexity, rugged link capable of direct transmission and reception of FM modulated, high quality, full-color video signals in the low portion (470–806 MHz) of the UHF frequency band (300–3000 MHz). The transmitter portion of the link is tunable. It is of the direct modulation (FM and FR simultaneously) type. The receiver is of the direct detection type with no need for any downconversion. Both transmitter and receiver are currently being tested for mobile and fixed applications at the Sandia Robotic Vehicle Range. Ranges in excess of 10 Km and simultaneous transmission and reception of three adjacent channels have been achieved using omnidirectional antennas. 6 refs., 13 figs.

35895 **(SAND—88-1675C) Neutralization and system effectiveness.** Paulus, W.K. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 21p. (CONF-880631—10). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011916/JAW.

From 29. annual meeting of the Institute of Nuclear Materials Management; Las Vegas, NV, USA (26 Jun 1988).

Security forces that can neutralize an attack force are essential to effectively safeguard special nuclear material (SNM) against theft or sabotage. Probability of neutralization, P(N), estimates the likelihood that security forces will win given that security forces interrupt the attackers and begin an armed engagement. Brief Adversary Threat Loss Estimator (BATLE) calculates P(N). BATLE was developed for the Nuclear Regulatory Commission in 1980. This paper describes a total repackaging of BATLE which will be called the Threat Neutralization Model. New features and capabilities are (1) guidance to the user in setting up the input parameters, (2) faster software, (3) graphical output and sensitivity curves to assist the user in interpreting the results, (4) compatibility with the SAVI vulnerability analysis program, and (5) operation under Microsoft Windows on personal computers.

35896 **(UCRL—97740) Evaluating late detection capability against diverse insider adversaries.** Sicherman, A. (Lawrence Livermore National Lab., CA (USA)). 3 Dec 1987. Contract W-7405-ENG-48. 7p. (CONF-8711108—3). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008678/JAW.

From American Nuclear Society topical conference; San Diego, CA, USA (29 Nov 1987).

This paper describes a model for evaluating the late (after-the-fact) detection capability of material control and accountability (MC&A) systems against insider theft or diversion of special nuclear material. Potential insider cover-up strategies to defeat activities providing detection (e.g., inventories) are addressed by the model in a tractable manner. For each potential adversary and detection activity, two probabilities are assessed and used to fit the model. The model then computes the probability of detection for activities occurring periodically over time. The model provides insight into MC&A effectiveness and helps identify areas for safeguards improvement. 4 refs., 4 tabs.

35897 **(UCRL—97741) Safeguards effectiveness evaluations in safeguards planning.** Al-Ayat, R.A. (Lawrence Livermore National Lab., CA (USA)). 3 Dec 1987. Contract W-7405-ENG-48. 5p. (CONF-8711108—4). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008677/JAW.

From American Nuclear Society topical conference; San Diego, CA, USA (29 Nov 1987).

This paper describes analytic tools we developed to quantify the effectiveness of safeguards against theft of special nuclear material by insiders. These tools help identify vulnerabilities in existing safeguards, suggest potential improvements, and help assess the benefits of these upgrades prior to implementation. Alone, these tools are not sufficient for safeguards planning, since the cost of implementing all suggested upgrades almost always exceeds the available resources. This paper describes another tool we developed to allow comparsion of benefits of various upgrades to identify those upgrade packages that achieve the greatest improvement in protection for a given cost and to provide a priority ranking among cost-effective packages, thereby helping decision-makers select the upgrades to implement and highlight the mount of residual risk. 5 refs., 3 figs.

35898 (INIS-mf—11153, pp 35-40) **4. Accounting of nuclear materials.** Lukavsky, J. 1987. (In Czech). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88780081/JAW.

In Nuclear power. CAEC lecturers' manual.

The questions are discussed of international policy significance of nuclear materials control and the ensuing position of IAEA. Attention is primarily paid to the Non-proliferation Treaty and to the international safeguards system based on agreements of safeguards among the individual countries and IAEA. In compliance with these agreements, around 600 nuclear installations are currently under control of IAEA. In the CSSR, a state system of nuclear materials record and management was established which fully meets the IAEA requirements while observing the internal regulations of the CSSR. CSKAE (Czechoslovak Atomic Energy Commission) was entrusted with the control of the state system and thus with the performance of state surveillance over the nuclear materials record and management. IAEA has been carrying out inspections of nuclear materials at Czechoslovak work places since 1972. No anomalies have been detected which would indicate possible misuse of nuclear materials. (Z.M.).

35899 (PNL—3594-Rev.8) **International nuclear fuel cycle fact book.** Leigh, I.W. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1988. Contract AC06-76RL01830. 247p. NTIS, PC A11;3. Order Number DE88010329/JAW.

As the US Department of Energy (DOE) and DOE contractors have become increasingly involved with other nations in nuclear fuel cycle and waste management cooperative activities, a need has developed for a ready source or information concerning foreign fuel cycle programs, facilities, and personnel. This Fact Book was compiled to meet that need. The information contained has been obtained from nuclear trade journals and newsletters; reports of foreign visits and visitors; CEC, IAEA, and OECD/NEA activities reports; proceedings of conferences and workshops; and so forth. Sources do not agree completely with each other, and the data listed herein does not reflect any one single source but frequently is consolidation/combination of information. Lack of space as well as the intent and purpose of the Fact Book limit the given information to that pertaining to the Nuclear Fuel Cycle and to data considered of primary interest or most helpful to the majority of users.

35900 (DPST—88-499) **In-bed measurement of tritium loading in process metal hydride beds.** Nobile, A. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1988. Contract AC09-76SR00001. 17p. (CONF-8804146—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011667/JAW.

From Storage science meeting; Los Alamos, NM, USA (4 Apr 1988).

The Replacement Tritium Facility at Savannah River Plant will make extensive use of metal hydride technology for the storage, pumping, isotopic separation, and compression of hydrogen isotopes. Two options were considered for routine accountability of tritium stored in metal hydride beds. One option was to use standard P-V-T-mass spectrometry techniques after desorption of storage beds to tanks of known volume. The second option was to develop a technique for direct measurement of bed loading. It was thought that such a technique would be more rapid and would account for heel, although some accuracy would be lost.The static nitrogen and flowing nitrogen methods were considered for this option. The flowing nitrogen method was eventually selected because it was insensitive to bed physical properties and isotopic gas composition, as well as being more accurate and easier to automate.

35901 (LA-tr—88-4) **Survey report: Stable isotope separation.** Bakhtadze, A.B. (Los Alamos National Lab., NM (USA)). 1988. Translated from Stable isotopes in the Life Sciences, International Atomic Energy Agency, Vienna, Austria, 1977, pp. 3-20. 19p. NTIS, PC A03/MF AMF A01.

Proceedings of a Technical Committee Meeting on Modern Trends in the Biological Applications of Stable Isotopes, Leipzig, Germany, 14-18 February, 1977.

The present state of development of methods of separating stable isotopes of light elements (C, N, O, S) is analyzed in the review, together with a discussion of the production of carbon, nitrogen and oxygen highly enriched in ^{13}C, ^{15}N and ^{18}O respectively and of nitrogen depleted of ^{15}N. Features and technical-economic characteristics of such technological processes of isotope production as chemical exchange and cryogenic distillation, which presently are in the widest practical use on an industrial scale, are discussed. Some problems of increasing the capacity of these processes in order to further increase the production of stable isotopes and make them much cheaper, as well as various aspects of stable isotope separation by selective excitation of atoms and molecules by laser beams and in electric discharges, are discussed. 86 refs., 1 tab.

(CONF-8606235—). Reprint from: Barton, J.P.; Farny, G.; Person, J.L.; Roettger, H. (eds.): Neutron radiography. Proceedings of the 2. world conference. Dordrecht: Reidel (1986) p. 367-374.

From 2. world conference on neutron radiography; Paris, France (16 Jun 1986).

A neutron radiography facility is described, which has been installed in the storage pond of the Isar 1 near Munich (KKI). The facility is designed for the inspection of BWR control elements.

Some of the control elements contain the neutron absorbing material boron carbide, filled in tubes. Neutron radiography can be applied to detect absorber losses by nondestructive testing. The design of the facility corresponds to the principle of the diving bell. A tube, with the upper side closed, is submerged at the edge of the pond and the water is pressed out by air. The set up contains an antimony-beryllium neutron source. For imaging the track track etch method is used. In an inspection program the blades of nine control elements were examined. The evaluations of the images yield the amount of boron losses in relation to neutron fluence exposure of the control elements.

35905 **Reaction of hydrogen sulfide with dinuclear palladium(I) complexes containing bis(diphenylphosphino)methane (dpm) and conversion of bridged-sulfide derivatives to bridged-sulfoxide species. X-ray structure of the dimetallic sulfoxide $Pd_2Cl_2(\mu\text{-}SO)(\mu\text{-}dpm)_2$, containing pyramidal sulfur.** Besenyei, G.; Lee, C.L.; Gulinski, J.; Rettig, S.J.; James, B.R.; Nelson, D.A.; Lilga, M.A. (Univ. of British Columbia, Vancouver (Canada)). *Inorganic Chemistry;* **26**: No. 21, 3622-3628(21 Oct 1987).

Hydrogen sulfide reacts with the complexes $Pd_2X_2(\mu\text{-}dpm)_2$ (1) and the mixed-ligand complex $Pd_2Cl_2(\mu\text{-}dpmMe)$ under ambient conditions to yield quantitatively H_2 and the corresponding A-frame, bridged-sulfide complexes such as $Pd_2X_2(\mu\text{-}S)(\mu\text{-}dpm)_2$ [X = Cl, Br, I; dpm = bis(diphenylphosphino)methane, dpmMe = 1,1-bis(diphenylphosphino)ethane]. The sulfide complexes can be oxidized by using m-chloroperbenzoic acid of H_2O_2 to the corresponding $\mu\text{-}SO_2$ derivatives via intermediate bridged-sulfoxide (μ-SO) species. The complex $Pd_2Cl_2(\mu\text{-}SO)(\mu\text{-}dpm)_2$, in which SO acts as a 2-electron donor, with the bonding at S being pyramidal, crystallized in the tetragonal space group $P4_2$ with a = b = 21.214 (1) A, c = 14.457 (1) A, and Z = 4; the data were refined to R = 0.069 on the basis of 2452 reflections with $I \geq 2.5\sigma(I)$. Two detected isomers of $Pd_2Cl_2(\mu\text{-}SO)(\mu\text{-}dpm)(\mu\text{-}dpmMe)$ appear to result from differing orientations of the oxygen at the pyramidal sulfur atom. The spontaneous loss of SO_2 from the $\mu\text{-}SO_2$ species regenerates 1 and allows for the two-stage, catalytic process: $H_2S + 2O \rightarrow H_2 + SO_2$. Mechanistic aspects of the reaction of H_2S with $Pd_2Cl_2(\mu\text{-}dpm)_2$ are briefly discussed. The complex $PdCl_2(dpm)$ reacts with H_2S under basic conditions to give $Pd_2(SH)_2(\mu\text{-}S)(\mu\text{-}dpm)_2$. 54 references, 3 figures, 5 tables.

35907 **(ADI—ENFOR051983) Feasibility assessment of biogas generation by anaerobic fermentation of pulp and paper wastes.** (Adi Ltd., Fredericton, New Brunswick (Canada)). May 1983. 79p. (CE—01432). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

Five bench-scale models were operated for nine months to evaluate the feasibility of anaerobic fermentation of two pulp and paper waste streams. Two downflow filters (DFF) and an ADI-bulk volume fermenter (BVF) were fed diluted high yield spent sulphite liquor (HYSSL) at 3 different average biochemical oxygen demand (BOD) loads, and BOD removals and specific methane productions were evaluated. Dynamic testing revealed the cloth media DFF biogas production response to shock load and feed cessation. Newsprint mill primary clarifier sludge (PCS) was fed to two wood media DFFs. The fibrous nature of the PCS posed difficulties for model operation, gas collection and sample analysis. Improvements in PCS settling and dewatering were noted as a result of anaerobic digestion. Economic projections for full-scale anaerobic treatment of HYSSL and PCS were made on the basis of model results. The results of these projections indicate that anaerobic fermentation may be an economical means of extracting valuable energy from these waste streams and reducing treatment and disposal costs. A sulphur balance conducted on the HYSSL cloth DFF model indicated that 66% of the total sulphur in the waste was removed by a crude sulphide scrubber-stripping system. The scrubber-stripper concept along with anaerobic treatment offers very interesting possibilities for chemical and energy recovery and waste treatment. 30 refs., 26 figs., 14 tabs.

35908 **(ANL/CNSV-TM—195) Development of improved microbial strains for methane production from municipal solid waste and wastewater.** Ho, N.W.Y. (Purdue Univ., Lafayette, IN (USA)). Jan 1988. Contract W-31109-ENG-38. 50p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010342/JAW.

The overall objective of this sub-program is to apply genetic engineering technology for the development of methanogen-based processes for improved methane production from municipal solid waste (MSW) and waste water. Specifically, the research is directed towards achieving the following goals: (I) the development of a transformation system for Methanobacterium thermoautotrophicum and Methanosarcina mazei; and (II) genetic manipulation of the genes effecting methane generation in M. thermoautotrophicum and Ms. mazei. In the past three years, we have carried out a great deal of work towards achieving the above listed goals. Our major accomplishments during these past three years are: (a) the establishment of a selection method for the development of a transformation system for M. thermoautotrophicum and Ms. mazei; (b) construction of potential cloning vectors for the transformation of M. thermoautotrophicum and Ms. mazei; (c) establishment of ideal conditions for the isolation, purification, and fragmentation of the individual subunits of methylreductase from M. thermoautotrophicum and Ms. mazei. (These will make it possible to analyze part of the amino acid sequence of each subunits to derive the ideal oligonucleotide probes for the isolation of genes encoding these subunits); (d) successful isolation of a number of partial gene fragments via the construction of lacZ fusions. (These gene fragments will be used first to study the necessary genetic elements for gene expression in M. thermoautotrophicum. Eventually, they will be used to construct hybrid genes which can be expressed in both E. coli and M. thermoautotrophicum. Our results also demonstrate that quite a few of the genes from M. thermoautotrophicum can be expressed in E. coli); (e) development of methods for the isolation of promoters from the methanogen genes; and (f) cloning, restriction mapping, and sequence analysis of the cryptic plasmid pME2001 from M. thermoautotrophicum.

35909 **(CONF-880231—2) Potential for gas recovery from small and medium sized landfills in the southeastern United States.** Bogner, J.E. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 12p. NTIS, PC A03/MF A01;3. Order Number DE88010029/JAW.

From Energy from municipal waste: resource recovery for small communities; Panama City, FL, USA (10 Feb 1988).

The majority of landfills in the southeastern United States are small-to-medium sized, receiving less that 600,000 cubic yards of refuse per year and covering an area of less than 100 acres. To date, most landfill gas recovery in the US has concentrated on the largest landfill sites with little consideration being given to landfills with less than about a million tons of refuse in place. Successful operation of gas recovery facilities at small-to-medium sized landfills in the UK and Europe suggests that there is potential for developing economically viable gas recovery projects at smaller sites in the US. 4 refs., 1 fig., 3 tabs.

35910 **(CONF-880702—8) Pyrolysis experiments with municipal solid waste components.** Helt, J.E.; Mallya, N. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 24p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009920/JAW.

From 23. intersociety energy conversion engineering conference; Denver, CO, USA (31 Jul 1988).

A majority of the combustible portion of municipal solid waste (MSW) is cellulosic in nature, comprising paper, newsprint, packaging materials, wood wastes, and yard clippings. If this material is pyrolyzed, the end products are: a highly carbonaceous solid char, a highly oxygenated liquid tar, and a mixture of gases with low to medium Btu content. All of the pyrolysis products offer the potential of being useful fuels or the intermediates for producing useful fuels. Current research at Argonne National Laboratory (ANL) is focused on obtaining a better understanding of the basic mechanisms, kinetics, and chemistry involved in the pyrolytic conversion of MSW and its components. Newsprint, kraft paper, polyethylene, and densified refuse-derived fuel (RDF) have been used individually and in mixtures as feedstock in a batch laboratory reactor. The pyrolysis has been at atmospheric pressure and temperatures of 350{degree}--800{degree}C. The products from the pyrolysis reaction have also been analyzed for both fuel properties (e.g., viscosity, calorific value, acid group concentrations) and chemical composition. The liquid products have been studied extensively using Fourier transform infrared spectrometry. Discussion is provided on the overall chemical mechanisms associated with the pyrolytic decomposition.

35911 **(CONF-8803101—1) Understanding landfill gas generation and migration.** Bogner, J.; Rose, C.; Vogt, M.; Gartman, D. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010020/JAW.

From 11. GRCDA annual international landfill gas symposium; Houston, TX, USA (21 Mar 1988).

Landfill gas research in the US Department of Energy (DOE) from Municipal Waste (EMW) Program is focusing on two major areas of investigation: (1) Landfill gas migration processes; and (2) Landfill gas generation. With regard to gas migration, a field investigation is examining bidirectional gas movement through landfill cover materials by processes of pressure and diffusional flow. The overall purpose of the study is to quantify gas loss from the landfill reservoir by natural venting and air influx due to pumping on recovery wells. Two field sites--a humid site with clay cover and a semiarid site with sand cover--have been instrumented to examine vertical gas movement through cover materials. Results from the humid site indicate that: (1) concentrations of methane, carbon dioxide, oxygen and nitrogen in soil gas vary seasonally with soil moisture; (2) based on average methane gradients in soil gas and a simple diffusion model, up to 10E5 g methane m/sup {minus /2} yr/sup {minus/1} are vented through the cover materials at the humid site (area of 17 ht); and (3) during prolonged wet weather, pressure gradients of more than 2 kPa may develop between the cover materials and top of refuse, indicating that pressure flow is periodically an important mechanism for gas transport. The second project is addressing landfill gas generation. The major goal is to develop simple assay techniques to examine the gas production potential of landfilled refuse. Refuse samples extracted from various depths in a landfill are being leached by three different methods to separate microbial mass and substrate. The leachates are being subjected to Biochemical Methane Production (BMP) assays with periodic qualitative examination of microbial populations using fluorescence microscopy of live cultures and scanning electron microscopy (SEM).

35912 **(DOE/ER/10684—T3) Methanogenesis from acetate, a key intermediate in nature: Final report.** Mah, R.A.; Boone, D.R. (California Univ., Los Angeles (USA). School of Public Health). 1988. Contract AS03-80ER10684. 9p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88008136/JAW.

It is now well appreciated that methanogenic bacteria obtain energy for growth during formation of methane from a limited range of substrates: H_2CO_2; formate; methanol; acetate; and the methylamines. Methane may also be produced from CO and methionine but these latter are not normally ecologically important substrates in nature. H_2CO_2 is used by almost all axenic cultures of methanogens except a few methanosarcinae strains. Acetate, however, appears to be restricted in nature to a smaller group of methanogens, most of which also metabolize methanol and the methylamines in addition to H_2CO_2. None of these methylotrophic methanogens have, thus far, been found to use formate. 15 refs.

35913 **(DOE/ER/13248—3) Theory on extreme thermophilic anaerobes growing over temperature spans of 40{degree}C or more: Final report for time period July 1985 through March 1987.** Wiegel, Juergen. (Georgia Univ., Athens (USA). Research Foundation). Mar 1987. Contract FG09-84ER13248. 11p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011583/JAW.

The goal is to study properties of extreme theromophilic anaerobes. Particularly the ability of several extreme thermophiles to grow over an extended temperature tolerant thermophiles to grow over an extended temperature span of 40{degree}C or more and to examine a theory on temperature tolerant thermophiles. The working hypothesis explains the extended temperature span growth and the concomitantly observed extended intermediary plateau in the Arrhenius graph of various extreme thermophilic bacteria by postulating that they possess two sets of some enzymes. Enzymes from one set function at the lower temperature range and the enzymes from the other set at the higher temperature range. The synthesis of the respective enzymes is temperature dependent. We examined enzymes sets and the temperature dependent synthesis using growth experiments. The direct goals were to establish the observed

growth pattern and temperature sensitive mutants of Methanobacterium thermoautotrophicum which can not grow wither at the upper or lower temperature range. 22 refs.

35914 **(DOE/ER/13376—2) One-carbon metabolism in anaerobes: Organic acid and methane production: Final technical report for period June 1, 1985-May 31,1987.** Zeikus, J.G. (Michigan State Univ., East Lansing (USA). Dept. of Biochemistry). Oct 1987. Contract FG02-85ER13376. 11p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008137/JAW.

Objectives of this project dealt with understanding one- and multicarbon metabolism in acetogenic and methanogenic bacteria. The biochemistry of acetate catabolism in Methanosarcina barkeri in relation to their major enzyme activities, co-factors and intermediates were studied. The physiological function of CO-dehydrogenase was investigated and found to be involved in hydrogen production when CO was used as substrate. Hydrogen metabolism from acetate by Methanosarcina barkeri was investigated through isotope tracer studies. Results showed that hydrogen production appears to be linked to several intracellular redox processes which follow the cleavage of acetate. The metabolic pathway in Butyribacterium methylotrophicum for multicarbon metabolism was elucidated. The key enzyme, ferredoxin-NAD reductase, was found to be regulated by NADH. The one carbon and multicarbon metabolic pathways in Butyribacterium methylotrophicum were constituted. Hydrogen was produced through multicarbon metabolism and was consumed by one carbon metabolism through the reduction of CO_2. Results revealed why high efficiency of carbon and energy conservation was observed in acetogens. The catabolism of formate to acetate by this microorganism was analyzed by fermentation time course and ^{13}C nuclear magnetic resonance studies. Results indicate a bifurcated single-carbon catabolic pathway in which CO_2 is the sole single-carbon compound that directly supplies the carbonyl and methyl group synthesis pathways leading to the formation of acetyl coenzyme A, the primary reduced product. 1 fig.

35915 **(PB—88-203187/XAB) Electrochemical activation of carbon dioxide. Annual report, October 1986-October 1987.** Lewis, N.S. (Stanford Univ., CA (USA). Dept. of Chemistry). Nov 1987. 31p. NTIS, PC A03/MF A01.

See also PB—87-169850.

This report reviews recent work on the development of catalysts for the reduction of carbon dioxide and protons. Macrocyclic cobalt complexes and mono and dinuclear ruthenium porphyrins were synthesized as potential catalysts. Quantitative generation of dihydrogen was observed from the reaction of reduced ruthenium octaethylporphyrin with protons. Less-powerful reductants, such as square planar cobalt macrocyclic complexes, gave up to 80% yields of dihydrogen under similar conditions. The reaction of reduced cobalt macrocycles with carbon dioxide was observed in aprotic media.

35916 **(PNL—6520) The development of a 20-inch indirect fired fluidized bed gasifier.** Flanigan, V.J.; Sitton, O.C.; Huang, W.E. (Pacific Northwest Lab., Richland, WA (USA)). Mar 1988. Contract AC06-76RL01830. 136p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88008462/JAW.

This report discusses the design, fabrication and operation of a 20" I.D. fluidized bed gasifier producing medium Btu gas. The reactor is indirectly heated using 30 x 1-inch U-tubes inserted in the inert bed. The U-tubes are heated using flue gases produced from a propane burner system located at the bottom of the reactor. The feed material was dry wood chips fed into the bed with a 6in. auger. The reactor was fed both into the bed and at the top of the bed. The fluidizing medium was superheated steam which was superheated to 1000{degree}F. The gas produced from the reactor was passed through a cyclone for char removal and routed to the flare for combustion and disposal. The parameters measured during the experimental runs were wood feed rate, steam flow rate, steam temperatures, bed temperatures, free board temperatures, product gas temperatures, bed differential pressures, char production, gas production, gas analyses, and tar production. The parameters measured in the laboratory were moisture contents (wood and char), ash contents (wood and char), and tar content. 9 refs., 19 figs., 11 tabs.

35917 **(PNL-SA—15339) Catalytic destruction of tars in biomass-derived gases.** Mudge, L.K.; Baker, E.G.; Brown, M.D.; Wilcox, W.A. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1988. Contract AC06-76RL01830. 16p. (CONF-880518—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009479/JAW.

From International conference on research in thermochemical biomass conversion; Phoenix, AZ, USA (2 May 1988).

The Biomass and Municipal Waste Technology Division of the US Department of Energy is sponsoring studies at the Pacific Northwest Laboratory on catalytic destruction of condensible hydrocarbons (tars) in biomass-derived gases. Currently gasifiers generate a significant amount of tars in the product gases. These tars create problems with plugging in downstream equipment and with wastewater treatment. Partial oxidation of the gas stream in a secondary fluid bed of catalyst destroys the tars in biomass-derived gases while increasing the energy content of the product gas by over 20%. Catalysts that remain active for tar destruction are used in the secondary reactor which is specially designed to promote destruction of tars and minimize oxidation of combustible gases such as CO and H_2. Results of studies with different catalysts which have been tested for this application are described.

35918 **(PNL-SA—15703) Thermochemical gasification of wet biomass and wastes.** Butner, R.S.; Elliott, D.C.; Sealock, L.J. Jr.; Neuenschwander, G.G. (Pacific Northwest Lab., Richland, WA (USA)). Mar 1988. Contract AC06-76RL01830. 18p. (CONF-880348—4). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008179/JAW.

From American Institute of Chemical Engineers spring national meeting; New Orleans, LA, USA (6 Mar 1988).

Experiments conducted with a 1-liter batch reactor have demonstrated that biomass and other lignocellulosic materials can be efficiently and quickly converted to a high quality gas product by heating them as aqueous slurries to temperatures of 380{degree}C to 450{degree}C under a pressure of 30.9 to 39.9 MPa in the presence of alumina supported nickel catalyst. PNL is currently in the process of building a small scale (4 l/h or approximately 1 gal/h) continuous reactor system to perform a series of experiments designed to better characterize reaction kinetics and catalyst stability. 5 refs., 2 figs., 3 tabs.

35919 **(SERI/PR—234-3169) Low pressure upgrading of primary oils from biomass: Annual report, 1 January 1986–31 December 1986.** Diebold, J.P.; Evans, R.J.; Levie, B.E.; Milne, T.A.; Scahill, J.W. (Solar Energy Research Inst., Golden, CO (USA)). Aug 1987. Contract AC02-83CH10093. 102p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88001125/JAW.

This report covers progress made during the period of 1 January 1986 to 31 December 1986 on the upgrading of oxygenated, primary pyrolysis oil vapors made from wood, to a high octane gasoline consisting primarily of toluene, xylenes, and trimethyl benzenes. Rapid screening tests, involving a fixed-bed of a few grams of catalyst, were performed in real time with the molecular-beam mass-spectrometer (MB/MS). The MB/MS work showed that HZSM-5 in extrudate form was significantly better in producing aromatic gasoline from the pyrolysis vapors than silicalite, HY zeolite, or silica-alumina. The effect of temperature in the 300{degree} to 500{degree}C range on the reactions was shown to dealkylate the gasolines and to increase the naphthalene yield, although overall yields appeared to be higher with increased temperatures. A slipstream of the pyrolysis vapors made in SERI's vortex reactor was passed through fixed beds of catalyst containing between 100 and 300 grams of HZSM-5 extrudate. The collected condensate was analyzed by GC-FID and confirmed the gasoline product quality predicted by the MB/MS rapid screening tests. Coke formation on the catalyst suggests this process is analogous to catalytic cracking of heavy petroleum fractions in a modern refinery rather than to the relatively coke-free methanol-to-gasoline process. Very preliminary economics are presented which indicate the potential to produce gasoline for $1.25 to $1.50 per gallon with successful development of this wood-to-gasoline process. 66 refs., 34 figs., 9 tabs.

35920 **(STEV-FGT—87-4) Studies of processes involved in biomass gasification. Final report.** Bitowft, B.; Andersson, L.; Bjerle, I. (Statens Energiverk, Stockholm (Sweden)). Jul 1987. 64p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752854/JAW.

A fundamental investigation of sintering properties of biomass during steam gasification in a fluidized bed reactor (FBR) was performed in a laboratory scale FBR (10 cm ID) at atmospheric pressure. The FBR was designed to promote clinker formation. The biomass used was wood char, 1-4 mm particle size, Geldart Group D particles. The quantity of clinker formed was considered as a function of the following variables: average bed temperature (640-910 degrees of Celsius), fluidizing velocity (12.2-38.1 cm/s), percent oxygen in steam (9.0-34.3 percent), and total oxygen flow (1.54-12.38 m/sup3//sxm/sup2/). Clinker was formed at average bed temperatures as low as 640 degrees of Celsius, but consistent behavior based on the average bed temperature was hard to determine. However there were some trends noticed between the opposing actions of the stirring action caused by fluidizing velocity and heat from combustion reactions caused by the presence of oxygen. It was shown that the total oxygen flow decribes this phenomenon better than the partial pressure of oxygen, due to oxygen's greater reactivity to carbon than steam's. Regression analysis was performed to yield an empirical equation with a reasonable correlation. Investigations of high temperature pyrolysis of biomass were carried out in a vertical tube reactor. Most of the effort during this period was directed toward finding the proper components to the vertical tube reactor unit, and perfecting the experimental method. At this time, the unit is in running order, and the experimental method has been perfected. Some of the raw data is presented here. (authors).

35921 **(STU—81-3049) Anaerobic digestion of manures in an expanded bed.** Linne, M. (Swedish National Board for Technical Development, Stockholm). 5 May 1986. 13p. (In Swedish). (STU—81-3049C; STU—81-3049D). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752972/JAW.

Conventional mesophilic fermentation of manures demands a long residence time and, consequently, large digester volumes. By introducing a carrier material on which the methane producing bacteria grows, the flow rate of organic material can be increased. In this project, the possibility to use a fluidized bed for digestion of swine manures has been examined. A pilot plant with a 0.5 m/sp3/ digester has been constructed. A carrier material is brought to fluidization using a circulation pump. At most 16 per cent of the volume could be filled with carrier pellets. This doubled the gas production compared to conventional runs. (L.E.).

35922 **(STU—83-5465) Composting of liquid manures in pilot scale.** Thyselius, L. (Swedish National Board for Technical Development, Stockholm). 24 Jun 1986. 41p. (In Swedish). (STU—81-4645). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752977/JAW.

The heat produced in composting manures has been measured. For cattle manures 50 and 160 kWh/m/sp3/ was produced for a resident time of 3 and 10 days respectively. Swine manures gave the figures 80 and 180 kWh/m/sp3/. 20 days composting of cattle manures produduced 285 kWh/m/sp3/. The experiments have shown that shorter residence times and higher organic loads can be achieved than in anaerobic treatment (biogas production). (L.E.).

35923 **(STU—84-3825) Survey of municipal biogas plants in Sweden.** Jerkbrant, B. (Swedish National Board for Technical Development, Stockholm). 19 Jun 1986. 35p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752978/JAW.

The report is the result of answers to a questionnaire and of visits to plants in the municipalities. The answers, received from 89 plants, are analyzed and discussed. Several of the plants sell the gas to district heating centrals, hospitals a.s.o., while others use the gas for producing electric power, mostly in TOTEM-units. Problems have been experienced particularly with the gas distribution system and with the discharge- and circulation system of the digester. (L.E.).

0902 Alcohol Fuels

REFER ALSO TO CITATION(S) 35924, 36709

35924 **(DOE/PC/79923—T1) The effect of chemical additives on the synthesis of ethanol: Technical progress report No. 1, September 15, 1987-December 15, 1987.** Chuang, S.S.C. (Akron Univ., OH (USA). Dept. of Chemical Engineering). 5 Jan 1988. Contract FG22-87PC79923. 8p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88007947/JAW.

The objective of this research is to elucidate the role of various chemical additives on ethanol synthesis over Rh- and Ni-based catalysts. Chemical additives used for this study will include S, P, Ag, Cu, Mn, and Na which have different electronegativities. This comprehensive research program includes investigation of the effect of additives on the surface state of the catalysts, heat of adsorption of reactant molecules, reaction intermediates, reaction pathways, reaction kinetics, and product distributions. During the first quarter of the project, a micro-reactor system has been built. $RhSiO_2$ and $Cu\text{-}RhSiO_2$ catalysts have been prepared for ethanol synthesis and reactive probing studies. CO hydrogenation was carried out with the above catalysts. Afterwards, 3-4 mole % of ethylene was added to the reactant stream. Ethylene hydrogenation was also carried out with $RhSiO_2$ and $Cu\text{-}RhSiO_2$ catalysts. 4 refs., 3 figs.

35925 **(FCC—ENFOR051982) Conversion of cellulose to ethanol using a two-stage process. Final report.** Saddler, J.N. (Forintek Canada Corp., Ottawa, Ontario). May 1982. 45p. (CE—01500). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

Over 100 strains of wood-rotting fungi were initially screened for their cellulase and β-glucosidase activities. Some of these strains were assayed for extracellular cellulase activity using a variety of different solid media containing carboxymethyl cellulose or acid swollen cellulose. The diameter of clearing of these plates gave an approximate indication of the order of cellulase activities obtained from culture filtrates of these strains. Trichoderma strains grown on Vogel's medium gave the higher cellulase yields. Culture filtrates from Trichoderma sp. E58 demonstrated the highest β-glucosidase activity giving a value of 1.1 IU/mg. A variety of different cellulose and pretreated wood substrates were hydrolysed using Trichoderma culture filtrates. The importance of the pretreatment conditions and ensuing chemical extractions of the cellulosic substrates was demonstrated by the range of ethanol values obtained in simultaneous saccharification and fermentation experiments using Zymomonas mobilis or Saccharomyces cerevisiae. The rate of hydrolysis of the cellosic substrates by Trichoderma culture filtrates, concentrated culture filtrates and whole cell cultures was compared. An ethanol value of 2.2% (w/v) was obtained for 5% solka floc using concentrated culture filtrates of Trichoderma and Z. mobilis or S. cerevisiae. 37 refs., 1 fig., 18 tabs.

35926 **(GAO/RCED—87-91) Alternative fuels: Information on DOD's methanol vehicle program.** (General Accounting Office, Washington, DC (USA)). 1987. 12p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The Army initiated the methanol vehicle demonstration program to establish the feasibility of using methanol as an alternative fuel for government vehicles. Army had difficulty obtaining new methanol vehicles because manufacturers were unwilling to provide the number needed for the program. Because of budget limitations the program was unable to test enough vehicles for a sufficient number of miles to decisively establish reliability and durability. The Army is examining methanol vehicle operation under cold, moderate, and hot climate conditions, but results will not be available until October 1987. In addressing support functions, the Army developed methanol fuel and lubricant specifications; methods for transporting, storing, and dispensing the fuel; and technical specifications for vehicle conversion. The program by itself contributed little to increasing the use of methanol fuel because the limited number of vehicles used did not encourage their methanol production or fuel distribution.

35927 (GAO/RCED—87-106BR) Alternative fuels: Feasibility of expanding the fuel ethanol industry using surplus grain. (General Accounting Office, Washington, DC (USA)). 1987. 73p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

This report examines two financing concepts in using surplus federally owned grain to further the development of the ethanol industry. They are (1) producers/developers would use surplus grain as collateral to obtain financing from lending institutions to construct new ethanol plants or expanding existing facilities and (2) producers/developers would use surplus grain as a free feedstock to produce ethanol, which could induce lending institutions to finance the construction or expansion of ethanol plants or facilities. Surplus grain inventories are large enough to support these concepts. However, producers/developers and lenders are skeptical about the concepts' usefulness for expanding the industry, given the current slump in the ethanol market. Most of producers/developers said the concepts were feasible; most lenders had little interest in the grain-as-collateral concept but were more interested in the feedstock-as-inducement concept. Department of Agriculture officials said that it is unlikely they would initiate the financing concepts unless directed by the Congress.

35928 (SERI/PR—234-3295) Mechanisms of pyrolysis of municipal solid waste: Annual report, 1 August 1985-30 July 1986. Evans, R.J.; Milne, T.A. (Solar Energy Research Inst., Golden, CO (USA)). Dec 1987. Contract AC02-83CH10093. 63p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88001158/JAW.

Studies of the effect of heating rate on the pyrolysis mass spectra of an RDF sample and a pyrolysis oil are presented. The time evolution of many ions from RDF pyrolysis species are shown. The foundations of factor analysis of mass spectra are given and application to pyrolysis oils shown and discussed in the context of compound classes in the very complex pyrolysis vapors. 32 refs., 15 figs., 7 tabs.

35929 Promoter effect of iron on olefin hydroformylation catalyzed by SiO_2-supported rhodium-iron bimetallic carbonyl clusters: Rh-Fe^{3+} bimetallic activation of catalytic CO insertion. Fukuoka, A.; Ichikawa, M.; Hriljac, J. A.; Shriver, D.R. (Hokkaido Univ., Sapporo (Japan)). *Inorganic Chemistry;* **26**: No. 22, 3643-3645(4 Nov 1987). Contract FG02-86ER13640.

Rh-Fe bimetallic carbonyl clusters have been employed as precursor for the preparation of Rh-Fe bimetallic catalysts. The structural properties of the Rh-Fe bimetallic cluster supported on SiO_2 were studied by means of Moessbauer and ir spectroscopy of chemisorbed CO. The results reported for the hydroformylation of ethylene and propylene indicate that the Rh-Fe^{3+} species derived from SiO_2-supported Rh-Fe carbonyl clusters are highly active for migratory CO insertion. These catalysts also enhanced the simple hydrogenation reactions. The activity and selectivity of the catalysts is thought to be due to the bi-site interaction with C- and O-bonded CO that is reflected in Fe promotion for C_1-C_2 alcohol production from CO and H_2 catalyzed on the Rh-Fe catalysts. 20 references, 1 table.

35930 Sewage treatment cuts waste, creates oil. *Environment;* **29**: No. 8, 24(Oct 1987).

Sewage treatment plants in metropolitan areas yield excessive amounts of sludge that are generally buried in landfills, dumped in oceans, or incinerated. Scientists are designing a new treatment process that may reduce by 80% the volume of sludge normally generated from treatment plants and that can convert the remaining sludge to diesel fuel oil. This potentially energy-saving and profitable technique is the goal of a two-year research project of American Fuel and Power Corporation and Battelle's Pacific Northwest Laboratories. In the process, primary sewage sludge is concentrated and the 20%-solids residue mixed with alkali. This mixture is heated under pressure to convert the organic component to a crude oil that is upgraded to a diesel fuel. A pilot plant for converting sewage sludge to fuel oil is planned for completion next summer, and American Fuel and Power hopes eventually to construct the conversion plants to serve cities with populations of 75,000 or greater.

0904 Solid Waste And Wood Fuels

REFER ALSO TO CITATION(S) 35578, 35593, 35594, 35627, 35639, 35993, 35994, 36163, 36540, 36677

35931 (ANL/CNSV-TM—199) Processing high solids concentration of municipal solid waste by anaerobic digester for methane production. Tsao, G.T. (Purdue Univ., Lafayette, IN (USA)). Jan 1988. Contract W-31109-ENG-38. 39p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008984/JAW.

Cellulosic solids are pretreated by calcium hydroxide to produce salts of volatile orangic acids and other water-soluble substances. Pure cellulose, sawdust, and waste paper are used as model substances for the study of alkaline degradation. It is found that sawdust is more difficult to degrade than the other two substances. The cooking conditions for high conversion of model substances and high yeild of orangic acids are found to be 275{degree}C to 300{degree}C with the corresponding reaction time from 30 minutes to 15 minutes. The cooking liquor can be readily fermented in an anaerobic fluidized-bed digester for methane production. The cooking liquor from different reaction conditions can all be digested by the methanogens. Higher than 90% of COD can be removed under the conditions of low organic loading rate (<2.0 g COD/l/day) and low hydraulic retention time (1.5 to 2.0 days). 14 refs., 10 figs., 2 tabs.

35932 (NEI-DK—61) Investigation of straw-fueled heating systems and fire prevention in practice. Pt. 2. Fire investigations. (Dansk Brandvaerns-Komite, Birkeroed). Sep 1983. 65p. (In Danish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752805/JAW.

This report describes an investigation of fires in connection with 27 manual fired and 33 mechanically fired straw-fueled power plants. For these fires it has been investigated what types of errors, which in particular have been causing the fires and the expences, also whether it were construction errors, installation errors, lack of maintenance or human errors. Through a comparison of data collected from straw-fueled plants, which have been involved in fires and data from a suitable selection of plants in Denmark, the investigated material has been analyzed and discussed. Based on the results of this investigation, possible measures to prevent fires and improve the security in straw-fueled plants are described, i.e. approval, strict demands for installation and installation control, demands for better maintenance, user instruction and revision of fire instruction no. 22. 13 refs. (SM).

35933 (NP—8770215) Economy of different methods to produce pellets/briquettes from straw, bark, waste wood, saw mill residues, waste paper and mixed raw materials for use in small furnaces. Final report - Text volume. Kolloch, P.; Schmittinger, B.; Ortmaier, E. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Feb 1987. 196p. (In German). NTIS (US Sales Only), PC A09. Order Number DE88770215/JAW.

In principle biomass of various origins can, under high pressure, be compressed into pellets and briquettes to be used as fuel in furnaces. The study aims at evaluating the economic efficiency of diverse procedures to obtain and compress the material and to use it as fuel. At current fuel market prices pelleting/briquetting is economically acceptable only under specific conditions. Production costs of pelleting/briquetting vary from DM 75 to DM 140 per ton depending on raw material and press output on the assumption that the press can be run for 1,500 hours per annum. In the Federal Republic of Germany, however, few presses are run for more than 500 h/a. With costs for straw from DM 40 to DM 150 per ton, fuel costs vary between DM 0.039 to DM 0.066 per kilowatt hour. On the present fuel market straw pellets are competitive with coal as fuel for small furnaces, particularly with regard to the high price of firewood. The break-even point for straw briquettes as substitute for oil is approached at DM 0.65 per liter fuel oil. For larger furnaces (> 100 kW/h) chopped wood or straw bales are to be preferred. The market price of energy is the main factor to influence the economic use of pelleting plants. A lasting market for pellets

from waste is unlikely. Even in future their use will be confined to special groups of consumers. With 40 refs., 107 tabs., 28 figs..

35934 **(SLU-IVL—178) Wood fuels effect on breakdowns and energy losses - two heating plants.** Gaerdenaes, S. (Sveriges Lantbruksuniversitet, Uppsala. Institutionen foer Virkeslaera). 1986. 62p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752848/JAW.

The importance of forest fuel for good operation economy has for long succession of years been greatly underestimated. The two analysed hotwater boilers in the present study gave varying results. One plant was very well fitted for different assortments while in the other the requirement for fuel seem to be of great importance for operation and energy loss. For the best plant the direct efficiency varied between 82-88 per cent, while the indirect efficiency varied between 88-90.5 per cent. In the other hotwater boiler the indirect efficiency during normal conditions gave 78 per cent, while the indirect efficiency during parade conditions was calculated as 88 per cent. Analysis showed that the moisture content had to be determined very carefully in order to reduce the uncertainly in the direct method. If the indirect method was used the boiler efficiency was not influenced in the same way by incorrectness in parameter values. The accomplished fuel specification for a pilot study in heating plants, consist of: determination of fuel assortment fraction distribution, composition, energy content and density determination. A sample burned with residues is a difficult fuel.

35935 **(SNV—3025) Operational studies of four Municipal Solid Waste Incineration Plants.** Bergstroem, J.; Lundqvist, J. (National Swedish Environmental Protection Board, Solna; Svenska Renhallningsverks-Foereningen, Stockholm). Jul 1985. 103p. (In Swedish). (DRAV—25). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752938/JAW.

The report presents the results obtained from the studies of four different plants. The operational studies were carried out at the plants in Malmoe, Avesta, Uppsala and Linkoeping for approximately ten weeks at each plant. Results from each of the four plants has been reported separately. The wastes incinerated at the plants during the study were apart from the standard mixture, of untreated municipal solid waste and industrial waste, also sorted refuse (RDF) and at some plants forestry waste. Studies of the operation were carried by monitoring about 40 operational parameters on data logg. The automatic data collection was supplemented with manual sampling and analyses. The manual samples have principally been intended for calculation of dust concentration, size distribution of particles and concentration of heavy metals in particles and gas phase. The unburnt content in slag and fly ash has been determined and also hydrochloric acid in the flue gas. In addition occurrence of organic compounds like polyaromatic hydrocarbons (PAH) and chlorinated aromatics have been determined in the flue gas from two plants. In the report views are presented on dimensioning requirements for the plants comprehending equipment and design from the refuse bunker to grate system, flue gas cleaning and control system. (authors).

35936 **(SNV—3028) Fuel and compost production at three waste treatment plants.** Ajnefors, F.; Hoejlund, A. (Statens Natuurvaardsverk, Solna (Sweden); Svenska Renhallningsverks-Foereningen, Stockholm). Jul 1985. 121p. (In Swedish). (DRAV—28). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752849/JAW.

Field tests have been carried out at 3 waste treatment plants: Sundsvall, Karlshamn and Falkenberg. In Sundsvall and Karlshamn, different operation cases for the shredder have been investigated. In Karlshamn and Falkenberg, the effects on the decomposting from different composting techniques have been studied. For the Tollemache shedder in Sundsvall it appeared that by varying the flail installation on the different floors, it is possible to control the particle size and thus the quantity of RDF. For the Hazemag-Universal shreddar in Karlshamn it was possible to adjust the production of RDF by varying the distance between the tearing and the rotor wheel. In the composting tests, the same decomposing time was obtained either the raw compost was mixed with sludge or with water. By windrowing, a mature compost was obtained after 10 weeks. It also appeared that by windrow composting, an intensified turning of the compost could compensate for the lack of aeration.

35937 **(SNV—3030) Instructions for optimum operation of waste heating plants.** Bergstroem, J. (National Swedish Environmental Protection Board, Solna; Svenska Renhallningsverks-Foereningen, Stockholm). Jul 1985. 38p. (In Swedish). (DRAV—30). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752939/JAW.

The report presents views on how to optimize energy from waste plants. The basis for the evaluation is mainly data from the operational studies in four Swedish waste incineration plants. There are separate reports published from each study. The objective of this report is to bring information to the operators of the plants. They can by systematic work find and optimize the parameters which increase the combustion efficiency in their plant.

35938 **(SNV—3031) Dioxin emission from waste incineration. A literature study.** Lindfors, G.; Solyom, P.; Waltersson, E; Eriksson, G. (Statens Natuurvaardsverk, Solna (Sweden); Svenska Renhallningsverks-Foereningen, Stockholm). Jul 1985. 33p. (In Swedish). (DRAV—31). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752851/JAW.

A critical assessment of reported studies on emissions of PCDD's and PCDF's from municipal waste incineration plants indicated that very few reported results are documented in such a way that they are comparable. (authors). With 32 refs.

35939 **(SNV—3033) Technology, Economics and Environmental Effects of Solid Waste Treatment. Final report from the DRAV-project.** Bergvall, G.; , Hult, J. (Statens Natuurvaardsverk, Solna (Sweden); Svenska Renhallningsverks-Foereningen, Stockholm). Jul 1985. 103p. (DRAV—33). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752850/JAW.

The aim has been to study technology,economy and environmental effects at existing waste treatment plants. The purpose was to obtain basic information and knowledge which would promote the development of improved handling techniques, reduced operation problems and reduced environmental effects. The project has been carried out in the form of inquiries, in the form of field investigations in which 23 treatment plants (4 incineration plants and 19 separation/composting plants) have been thoroughly investigated over periods of from 1-2 days up to 20 weeks, and as well defined subprojects where important problems were studied. Further on manuals have been put together for sampling, analysis and optimal operation of plants. The results have been published in 31 separate reports. The final report summarizes the most important results. (authors).

35940 **(STEV-TB—88-4) Blending of refuse derived fuels (RDF) and coal.** Widell, B. (Statens Energiverk, Stockholm (Sweden)). 21 Dec 1987. 93p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753341/JAW.

Technical, economical and environmental requirements for blending refuse derived fuels (RDF) and coal at coal fuelled plants are studied. Production costs are discussed and combustion techniques are described. (G.B.).

35941 **(Y/DZ—386) Recycle of waste paper.** Hackett, G.D.; Harris, G.E. (Oak Ridge Y-12 Plant, TN (USA)). Jan 1988. Contract AC05-84OS21400. 28p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010837/JAW.

One of the Oak Ridge Y-12 Plant's long range goals is to reduce the amount of waste from the plant. The large amount of waste paper generated by the plant is currently buried in the state permitted landfill. Methods of recycling cardboard and paper which comply with all security requirements, health, safety, and environmental regulations of the Y-12 Plant are sought to conserve the landfill. A process to compact paper into a form which may be used as fuel and fed into the existing steam plant has been developed. A water-resistant briquette has been made from waste paper,

a binder, and coal. Laboratory and pilot scale briquetting and pulverizing tests have been completed. These briquettes have physical properties similar to those of coal. 12 tabs.

35943 (CONF-8609418—, pp 159-175) **Laterit as construction material for dams in Nigeria.** Moser, M.A. (Bilfinger und Berger A.G., Wiesbaden (Germany, F.R.)). 1986. (In German). NTIS (US Sales Only), PC A25/MF A01. Order Number DE88770212/JAW.

From Meeting and technical exhibition on construction foundations; Nuernberg, F.R. Germany (22 Sep 1986).

Laterit is an easy to handle and very economic construction material. This is illustrated on three earth dams in the northern part of Nigeria. The generation and the different types of laterit are discussed. It is shown that for the behaviour of the structures an effective quality control is decisive and the organisation as well as the duties of the laboratory section is explained.

35944 (CONF-8609418—, pp 177-204) **Dam stabilization by paste grouting at a dammed river. Planning and construction.** Heil, W.; Wittke, W. (Wasser- und Schiffahrtsamt Saarbruecken (Germany, F.R.); Technische Hochschule Aachen (Germany, F.R.)). 1986. (In German). NTIS (US Sales Only), PC A25/MF A01. Order Number DE88770212/JAW.

From Meeting and technical exhibition on construction foundations; Nuernberg, F.R. Germany (22 Sep 1986).

In the scheme to make the River Saar navigable, the Federal Railways embankment in the Serrig pond has been partially submerged due to the raising of the mean river level by some 11.80 m. The section of embankment had to be stabilized by paste grouting in order to prevent sudden irregular subsidence of the embankment by 8-10% and to maintain the Federal Railways operations in their full extent. Two preliminary tests established the composition and mixing procedure of the paste as well as the drilling procedures. Completion of the work in the short time allowed depended on high-performance mixing plants, grouting stations and drilling equipment. The evaluation of all available data and the conclusions drawn during and after grouting demonstrate the effectiveness and success of the chosen method.

35945 (CONF-8609418—, pp 261-273) **Earth static safety evaluation of dams at water reservoirs.** Baumann, J.; Ochmann, H. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Grundbau und Bodenmechanik). 1986. (In German). NTIS (US Sales Only), PC A25/MF A01. Order Number DE88770212/JAW.

From Meeting and technical exhibition on construction foundations; Nuernberg, F.R. Germany (22 Sep 1986).

Some safety aspects of dams are not considered by standard-calculations. There are some new steps and methods presented. They concern the estimation of the behaviour of shales, seepage along concrete crossings inside dams, stability analysis, and the valuation of calculated results.

1303 Plant Design And Operation

35946 **(DOE/ID/12121—2) Low-Head Hydroelectric Power Demonstration Project, City of Gonzales, Texas: Final operation and maintenance report.** (Gonzales Electric Dept., TX (USA)). Mar 1988. Contract FC07-80ID12121. 61p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010723/JAW.

The purpose of this report is to summarize the first two years of operation of this project beginning January 1984 and ending December 1985. The report includes descriptions of equipment procurement, on-site construction contracts, and installation of turbines and generators.

35947 **(DOE/ID/12124—2) Small-Scale Hydroelectric Power Demonstration Project: Boott Hydropower, Inc., Eldred L. Field Hydroelectric Project: Final operation and maintenance report.** (Boott Hydropower, Inc., Lowell, MA (USA)). Mar 1988. Contract FC07-80ID12124. 42p. NTIS, PC A03;3. Order Number DE88010168/JAW.

This report summarizes the Project's first two years of operation with respect to output, operation/maintenance costs, and outages. 13 figs., 4 tabs.

1305 Economics And Management

35948 **(GAO/RCED—88-19) Federal electric power: Western Area Power Administration's Tracy/Livermore Transmission Project.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 1987. 21p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The Western Area Power Administration is a Department of Energy agency that markets electric power generated by federal hydroelectric dams in 15 central and western states. Western is planning to construct the Tracy/Livermore transmission line and GAO found no legal basis to question Western's authority on its plan. With a direct tie line, the Livermore Laboratory will have greater flexibility in obtaining its power from other utilities. In addition, the ultimate savings to be realized from the project will depend upon the extent to which a number of events anticipated by Western's analysis in support of building the line actually occur.

1306 Environmental Aspects

35949 **(DOE/EA—0278) Proposed fish passage improvements at Three Mile Falls Diversion Dam, Umatilla River, Oregon: Finding of no significant impact.** (Bureau of Reclamation, Boise, ID (USA). Pacific Northwest Region). May 1986. 123p. NTIS, PC A06;3. Order Number DE88011444/JAW.

The Bureau of Reclamation proposes to administer the construction of fish passage and protective facilities at Three Mile Falls Diversion Dam on the Umatilla River in Oregon to increase the numbers of anadromous fish. The Bonneville Power Administration (BPA) proposes to provide funding for the project. These agencies' actions would implement section 904(d) of the Northwest Power Planning Council's Columbia River Basin Fish and Wildlife Program which addresses the provision of offsite enhancement to compensate for fish and wildlife losses caused by hydroelectric project development and operations throughout the Columbia River Basin. This Finding of No Significant Impact (FONSI) is the National Environmental Policy Act (NEPA) decision document for both agencies. The proposed action would improve both upstream and downstream passage by providing a new right bank ladder on Three Mile Falls Diversion Dam, modifying the existing left bank ladder, and installing rotary drum fish screens and related structures on the adjacent West Extension Irrigation District (WEID) Canal. Four other alternatives are considered in the environmental assessment (EA): a concrete apron plus a left bank ladder; a cap on the crest of the dam plus a left bank ladder; dam removal; and no action. 5 figs., 6 tabs.

14 SOLAR ENERGY

35950 (DOE/SLB—88/1) Solar Buildings Technology: Solar heating, cooling, and daylighting for buildings: Current abstracts. Smith, L.; Steele, B.C. (eds.). (USDOE Office of Scientific and Technical Information, Oak Ridge, TN). Jan-Feb 1988. 14p. (PB—88-932901). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008291/JAW.

Solar Buildings Technology: Solar Heating, Cooling, and Daylighting for Building (SLB) announces on a bimonthly basis the current worldwide information available on solar technologies for heating, cooling, and daylighting buildings. SLB highlights research on advanced materials and solar system concepts, and information on the performance of these advanced technologies.

1401 Resources And Availability

35951 (SAND—87-2379) A comparison of typical meteorological year solar radiation information with the SOLMET data base. Menicucci, D.F.; Fernandez, J.P. (Sandia National Labs., Albuquerque, NM (USA)). Feb 1988. Contract AC04-76DP00789. 406p. NTIS, PC A16;3. Order Number DE88009242/JAW.

Over the years the misapplication of TMY and SOLMET data has become increasingly prevalent and, in some cases, has led to improperly sized solar energy systems or incorrect conclusions from research efforts. Much of the misapplication stems from misunderstanding and confusion about the origin, design and originally intended uses of these data. This report outlines the historical development of the SOLMET and TMY data bases and discusses the various appropriate applications for them. A majority of the report is devoted to the presentation of summary solar radiation information about the SOLMET data base and associated TMY data. Solar resource summary statistics are computed for direct normal, total normal, and fixed tilt collectors at thirty-eight sites. For each site, statistical information is presented in graphical and tabular form and can be used to compare the representative TMY year to each SOLMET year. This report is specifically intended for individuals who use TMY and/or SOLMET solar radiation data in some aspect of solar system design, analysis, or operation and want information about the potential yearly variation of the solar resource in various locations throughout the US.

35952 (SERI/SP—320-3305) SERI Standard Broadband Format: A Solar and Meteorological Data Archival Format. (Solar Energy Research Inst., Golden, CO (USA)). Apr 1988. Contract AC02-83CH10093. 53p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88001145/JAW.

This manual describes a tape archival format appropriate for use with research-level solar radiation data. It serves both as a reference for users reading data recorded in he SERI Broadband Format (SBF) and as a guide to archiving solar, meterorological, and weather data in SBF. The manual's intended audience includes solar researchers, engineers, and climatologists as well as data processing professionals. A comprehensive list of solar, meterorological, and weather parameters is included in the format. In addition, the format's flexibility allows the user to add parameters and otherwise tailor the format to meet individual needs. SBF is particularly well suited to handling broadband solar radiation data. Also, instrument orientations (viewing angles), of special interest in solar applications, are given complete, unambiguous coverage in the header for each parameter. Standardized block lengths and detailed header information make it easy to read the data. A researcher recording in this format should be able to include all the basic information a user would require to interpret the data. Blanks and nulls are interspersed in the header and between data elements to make tape dumps readable.

35953 (SERI/TR—215-3294) Uncertainty analysis for thermopile pyranometer and pyrheliometer calibrations performed by SERI. Myers, D.R. (Solar Energy Research Inst., Golden, CO (USA)). Apr 1988. Contract AC02-83CH10093. 30p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88001156/JAW.

The absolute uncertainity in the calibration of radiometers that SERI uses to measure and monitor solar radiation data is derived in this report. We briefly describe the parameters the instruments are designed to measure, the instruments we calibrate, the reference standards used, and our data acquisition equipment. We also describe calibration techniques and methodology. Each element of the calibration process is evaluated for its contribution to the total uncertainty in the calibration factor. The derivation of the calibration uncertainty discusses all sources and magnitudes of errors contributing to the final uncertainty. We use a standardized methodology, combining the estimates into a total uncertainty, or error bar, associated with the derived calibration factors for the instruments under test. The absolute values of the calibration factors have 95% probability of lying within the error limits we arrive at. 40 refs., 9 figs., 5 tabs.

35955 (NRC/E—07011981) Solar energy review and R & D plan for 1981/1982 - 1985/1986. (National Research Council of Canada, Ottawa, Ontario. Div. of Energy). 7 Jan 1981. 56p. (CE—01418). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This report outlines the background, policy framework, and aims and objectives of Canada's Solar Energy Program (SEP), provides a brief review and status report on solar energy technology, considers in some detail techniques for establishing research and development priorities and developing plans directed at a specific objective, discusses other factors and their impact on the plan, and outlines a proposed SEP plan and alternatives. Considering the opportunities for energy contribution and the implication of the other factors affecting the SEP, a 5-year plan has been developed aimed at the industrial solar capability in the general areas of: small building applications; commercial, industrial, and agricultural applications, and photovoltaics. This program would place the greatest emphasis on domestic water heating and passive/hybrid space heating, considerable emphasis on small scale active space heating and active swimming pool heating and, on an urgent basis, evaluate the opportunities and feasibility of using solar energy for commerical water and industrial process heating, air preheating and drying, central solar heating, greenhouses, and lighting and of applying similar technologies for passive cooling. 10 refs., 4 tabs.

35956 Effects of land clearing on bordering winter annual populations in the Mohave Desert. Hunter, R.; Turner, F.B.; Lindberg, R.G.; Hunter, K.B. (Lab. of Biomedical and Environmental Sciences, Mercury, NV (USA)). *Great Basin Naturalist;* 47: No. 2, 234-238(30 Apr 1987). Contract AC03-76SF00012.

Construction of a 10-MWe solar thermal power plant in Daggett, California, involved clearing and leveling 53 ha of desert land. Transient offsite effects of this construction were apparent as a reduced density of annual plants within 100 m downwind of the edge of the cleared area. Schismus arabicus populations recovered within four years, but Erodium cicutarium populations did not. The effects appeared to be related more to an interaction of seed-dispersal mechanisms with the large, open space than to the obvious sand movement and deposition associated with the clearing operations. 4 references, 1 figure, 5 tables.

35957 (AD-A—190268/3/XAB) High-efficiency thin-film silicon-on-gap solar cell for improved radiation resistance. Final report, July 1986-February 1987. Culik, J.S. (Astrosystems International, Inc., Newark, DE (USA). Astropower Div.). Sep 1987. 28p. NTIS, PC A03/MF A01.

The ultimate high-efficiency silicon solar cell is a light-trapping thin-film silicon structure epitaxially grown on an oxide overcoated substrate such as silicon or gallium phosphide (GaP). In addition to high performance, this thin-base silicon device is more tolerant of radiation effects than a thick-base solar cell because this structure is less sensitive to reductions in minority-carrier diffusion length. The oxide overcoating layer, an integral part of this design, will serve as a dielectric back surface reflector leading to light trapping, and it will also eliminate dangling bonds in the overgrown silicon layer, effectively passivating the silicon-oxide interface and reducing back-surface recombination.

35958 (ANL/EES-TM—346) Nepal forestry initiative: 1986-1987 annual report. Kilpatrick, K.; Shen, S.Y.; Vyas, A.D.; Johnson, D.O. (Argonne National Lab., IL (USA)). May 1988. Contract W-31109-ENG-38. 67p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88011801/JAW.

The Nepal Forestry Initiative is a project developed through discussions between the US Agency for International Development (AID) and His Majesty's Government of Nepal and managed for AID by Argonne National Laboratory. The project seeks to facilitate widespread acceptance of multipurpose tree species cultivated under various production systems. Production systems selected for research and demonstration include alley cropping, contour hedgerow, and short rotation. A site in the Dhading District of the Mid-Hills Region of Nepal is serving as the first project site. Site delineation, shed construction, and the first stage of terrace building have been completed. Planting stock for several native species and some exotic species has been collected, and attempts to propagate these species in the nursery have begun. A socioeconomic survey of the people who will be directly affected by the project was conducted. It was followed by a survey to identify the multipurpose tree species being used by the local population. Two advisory committees -- a technical advisory committee and a social/cultural advisory committee -- have reviewed the initial project document and the progress through September 1987. Their written evaluations are appended to this report.

35959 (BCR—ENFORBCX284) Predicting logging residues in British Columbia. Tunner, A.; Standish, J.T. (B.C. Research, Vancouver (Canada); Talisman Land Resource Consultants, Vancouver, British Columbia (Canada)). 1986. 47p. (CE—01453). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

A computer simulation model is presented which allows the calculation of residual biomass following conventional harvesting. The model is applicable to British Columbia, and requires the user to specify the level of tree utilization and to provide forest stand data (Compartment Area Statement) available from the British Columbia Ministry of Forests. However, it can be used to give estimates for any forest stand that a user may specify. Outputs are in total tonnes by tree component (stem wood, stem bark, three size classes of branches and foliage). The model applies biomass equations and uses modified form of merchantablility, decay, waste and breakage factors to estimate the amount of biomass removed by logging according to specified utilization limits. Biomass removed by logging is subtracted from the standing biomass (before logging) to arrive at the residual biomass. The purpose of the model is to estimate forest biomass that is potentially available for energy conversion. Such estimates are needed for decision making in energy policy as well as more specific decisions on the need for and location of biomass conversion plants. 25 refs., 1 fig., 34 tabs.

35960 (CFS/MA—ENFORMX139) The economics of harvesting fuelwood under four different stand conditions on Prince Edward Island. Peters, D.C. (Canadian Forestry Service, Fredericton, New Brunswick. Maritimes Div.). 1982. 8p. (CE—01498). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

The forests of Prince Edward Island have been subjected to highgrading and neglect for 300 years. An opportunity exists to rehabilitate many of the Island woodlots by cutting fuelwood and thinning. Woodlot productivity would thus be improved in many areas and fuelwood could be provided to an expanding market. This study had two major objectives: to demonstrate and evaluate the economics of harvesting fuelwood under different, but typical, stand conditions, and to improve the productivity and value of Island woodlots. Selective harvesting using modified smallscale equipment was carried out in four stand types: immature (pole-size) tolerant hardwood, mature softwood/intolerant hardwood, mature softwood/tolerant hardwood, and immature softwood. The primary end product is fuelwood. Records of labor cost, volume extracted, equipment modification and maintenance cost, and market value of extracted wood are documented for each stand type. In the four stand types studied, the mature softwood/tolerant hardwood thinning proved to be the only profitable operation under the conditions encountered. With improved thinning rates and better operating conditions, three of the four operations might, at least break even or be profitable. This, in addition to the future benefit of an improved stand, would be an attractive incentive for stand improvement. The tractor/modified trailer and the snowmobile/sled exhibited the best extraction rates, and under favorable conditions, the tractor/manual trailer showed an acceptable extraction rate. 6 refs., 8 figs., 6 tabs.

35961 (CFS/PNFI—ENFOR31984) The role of chemical fertilizers in intensive forestry. Burgess, D. (Institut Forestier National de Petawawa, Chalk River, Ontario (Canada)). 1984. 50p. (CE—01461). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This paper is aimed at giving insight into the efficient use of chemical fertilizers in forestry. The approach followed involves maintaining a broad perspective while examining those factors which play a major role in determining how fertilizers are used. Such factors have been discussed elsewhere, but the information tends to be scattered or presented within a limited framework. Forest management is becoming more intensive and this trend is expected to continue as the demand for wood for energy and more conventional wood products continues to increase. There is an urgent need to develop ways of increasing fibre yields without harming the productivity of forest soils. Information is presented here on the mineral requirements of higher plants. The influence of forestry on nutrient availability, fertilizer types and their application, and limitations on fertilizer use are also discussed. These discussions provide a background to the section on principles of efficient use of fertilizers, which can serve as a guide to forest managers interested in using chemical fertilizers. Future research needs re-

lated to forest fertilization are also described. 96 refs., 3 figs., 18 tabs.

35962 **(CFS/SF—LAUX50) Implications of whole tree harvesting for biomass recovery.** Routhier, J.-G. (Canadian Forestry Service, Sainte Foy, Quebec). Dec 1981. 134p. (In French). (CE—01439). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

If trees are delimbed and topped at a plant site rather than at the cutting area, their limbs and tops can more readily be used for energy production. In the green state, recovered limbs and tops constitute a biomass of 200 to 300 kgm^3 of merchantable wood for softwood species in eastern Canada. Full trees can be harvested and transported on private roads without major difficulty. A plant concept for delimbing, topping, slashing and debarking trees is presented in this report. The elimination of delimbing in the forest promotes mechanization of felling and skidding operations. If the additional biomass that is recovered can be sold at $35 per oven-dry tonne, a much lower price than the energy-equivalent amount of oil ($54), then the additional investments required in the forest and at the mill to recover the biomass yield an after-tax rate of return at real prices (no inflation) of 27%. Chipping full trees in the forest and purifying the chips at the mill is a process now being developed that offers the pulp and paper industry another means of recovering a maximum amount of biomass. Current knowledge of this technique indicates that its economic potential is comparable to that of processing full trees at a plant. 7 refs., 22 figs., 27 tabs.

35963 **(CONF-880181—1) Modeling the primary events of photosynthesis using chlorophyll containing fixed distance donor-acceptor molecules.** Wasielewski, M.R.; Johnson, D.G.; Svec, W.A. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 4p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010033/JAW.

From U.S.-Japan information exchange seminar; Kyoto, Japan (8 Jan 1988).

Two specific questions that we addressed are: how does the dimeric primary electron donor in photosynthetic proteins initiate charge separation, and how do electron transfer reactions from chlorophylls to quinones depend on free energy of reaction and the surrounding medium. 1 fig.

35964 **(CONF-880215—5) Sustainable multipurpose tree production systems for Nepal.** Shen, S.Y.; Kilpatrick, K.J. (Argonne National Lab., IL (USA)). Mar 1988. Contract W-31-109-ENG-38. 30p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011969/JAW.

From Energy from biomass and wastes; New Orleans, LA, USA (15 Feb 1988).

Argonne National Laboratory is developing methods for producing reforestation plating stock, fuel, and fodder in a sustainable manner in Nepal. This project, in cooperation with the Ministry of Forest and Soil Conservation of Nepal, is sponsored by the US Agency for International Development (AID). Several production systems are being evaluated for the Mid-Hills Region of Nepal. To provide sustainable biomass production and ecological management of the fragile Mid-Hills Region, the production systems must simultaneously satisfy the physiological requirements of the plants, the symbiotic requirements of the plant and the microorganisms in its rhizosphere, the physicochemical requirements of nutrient and water cycling, and the climatic and topographic constraints.

35965 **(CONF-8709271—Absts.) Bio Technica Hannover '87. Conference abstracts.** (Deutsche Messe- und Ausstellungs-A.G., Hannover (Germany, F.R.)). 1987. 67p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88770212/JAW.

From 3. international exhibition and congress for biotechnology (BIOTECHNICA-3); Hannover, F.R. Germany (22 Sep 1987).

The conference papers deal with biotechnological processes in the field of medicine, genetic engineering, production of proteins, peptides and hormones.

35966 **(DOE/ER/10590—2) Factors governing light driven electron and proton translocation in proteins across membranes.** Dutton, P.L. (Pennsylvania Univ., Philadelphia (USA). Dept. of Biochemistry and Biophysics). [1988]. Contract AC02-80ER10590. 25p. NTIS, PC A03;3. Order Number DE88011120/JAW.

A series of preliminary studies showed that both the direct electrical and the Q/sub A/ replacement avenues of approach were feasible. That the reaction centers could be incorporated in planar bilayer membranes to a density of {approximately}10^9 cm/sup {minus/2} was determined and with metal electrodes on either side of the supporting membranes flash activated voltages and transient currents could be monitored. The reaction centers were deposited in a 50:50 mix of vectorially opposing populations. By this approach, simple optical studies cannot easily be performed on the film either alone or simultaneous with electrical assay. The successful construction of reaction center mono (and multi) layers formed in a Langmuir Blodgett trough and deposited on planar solid supports was demonstrated. A simple spectrophotometric analysis was done on the dry film. Direct transmission assay of the optical properties of single monolayers supported the finding of {approximately}5 {times} 10^{12} raction centes cm/sup {minus/2}; linear dichroism showed that the orientation of the reaction center chromophores were as found in vivo. The reaction centers responded to flash activation.

35967 **(DOE/ER/13198—3) Structure and function of Frankia vesicles in denitrogen fixation by actinorhizal plants: Annual technical progress report for period January 1, 1987-November 15, 1987.** Torrey, J.G. (Harvard Univ., Petersham, MA (USA). Harvard Forest). 20 Nov 1987. Contract FG02-84ER13198. 6p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88007937/JAW.

Frankia is a filamentous soil bacterium of the Actinomycetales that is capable of fixation of atmospheric dinitrogen both in the free-living state and within root modules of a number of woody dicotyledonous plants in a symbiotic process. The bacterium is of special interest because of its genetic capacity to differentiate terminal swellings of the hyphal filaments called vesicles. Vesicles form in the free-living organism when deprived of combined nitrogen substrates under aerobic conditions. A multilaminate envelope surrounds the vesicle providing a barrier to direct exposure of the oxygen-labile nitrogenase enzyme that forms within the vesicle. In root nodules, vesicles may or may not form, depending upon the structural configuration of the host plant cells, the ambient oxygen concentration surrounding the root nodule and the expression of host-microbial interactions under the control of the two genomes. Under varying stresses of nutrient availability and the changing gaseous environment, remarkable adaptations may occur in either or both partners of the symbiosis to optimize dinitrogen fixation. 9 refs.

35968 **(DOE/ER/13255—1) [Hydroxyproline-rich glycoprotein of the plant cell wall]: Report on work from June 1987 to June 1988.** (Washington Univ., St. Louis, MO (USA)). 1988. Contract FG02-84ER13255. 4p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88010534/JAW.

In soybean seed costs the accumulation of the hydroxproline-rich glycoprotein extensin is regulated in a developmental and tissue-specific manner. The time course of appearance of extensin during seed development was studied by Western blot analysis and by immunogold-silver localization. Using these techniques extensin was first detected at 16 to 18 d after anthesis, increasing during development to high levels at 24 d after anthesis. Immunogold-silver localization of extensin in the seed coat showed marked depostion of the glycoprotein in the walls of palisade epidermal cells and hourglass cells. The immunolocalization of extensin in developing soybean seeds was also made by a new technique - tissue printing on nitrocellulose paper. This technique shows that extensin is primarily localized in the seed coal, hilum, and vascular elements of the seed.

35969 **(DOE/ER/13261—2) Electrochemical and optical studies of model photosynthetic systems: Progress report, July 1, 1987-June 30, 1988.** Cotton, T.M. (Nebraska Univ., Lincoln (USA). Dept. of Chemistry). 15 Feb 1988. Contract FG02-84ER13261. 6p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88009291/JAW.

During the first eight months of this funding period, we have continued our studies of photosynthetic model systems using Langmuir-Blodgett monolayers, self-assembled monolayers, and vesicles. These model systems were characterized by electrochemical and optical methods (resonance Raman, UV-Vis, and surface-enhanced resonance Raman scattering (SERRS) spectroscopy). A number of different redox-active molecules were examined in addition to the natural photosynthetic pigments. A brief summary of the results is discussed.

35970 **(DOE/ER/13465—3) Magnetic resonance and optical spectroscopic studies of radiation produced radicals: Progress report, December 1, 1985-November 30, 1988.** Kispert, L.D. (Alabama Univ., University (USA). Dept. of Chemistry). May 1988. Contract FG05-86ER13465. 8p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011527/JAW.

The role of a host lattice of carotenoids were studied in the formation of radicals and excited singlet and triplet states that are relevant to photosynthesis. Particular emphasis is being placed on determining what is special about carotenoids that natural photosynthetic systems require them as antennae as well as for protection. The host matrix was manipulated so as to understand the carotenoid function of protection, quenching, energy transfer and antenna and also the structure of carotenoid cations. To characterize their properties, we have carried out EPR, optical, molecular orbital and electrochemical studies of carotenoid cations produced chemically, electrochemically, radiolytically (x-ray irradiated freon matrices) and photolytically (solution photolysis by excimer radiation) as a function of the host matrix. 42 refs.

35971 **(DOE/ER/13602—2) Environmental stress mediated changes in transpirational and translational regulation of protein synthesis in crop plants: Progress report, 1987--1988.** Key, Joe L. (Georgia Univ., Athens (USA). Dept. of Botany). Apr 1988. Contract FG09-86ER13602. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011580/JAW.

These studies have emphasized the characterization of HS cDNA and genomic clones, development and partial characterization of a HS-cassette for expression of various genes under the control of a very strong HS promoter, analyses on the regulation of the HS response and some aspects of thermotolerance using amino acid analogues, including studies of arsenite and cadmium on HS and thermotolerance. 11 refs.

35972 **(DOE/ER/13694—1) Partial support of a workshop entitled Rubisco '87, ribulose 1,5-bisphosphate carboxylase-oxygenase genes, proteins and the regulation of activity. Final performance report.** Jensen, R.G. (Arizona Univ., Tucson (USA). Dept. of Biochemistry). 25 Apr 1988. Contract FG02-87ER13694. 6p. (CONF-8704103—Summ.). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88010814/JAW.

From International workshop on ribulose-1,5-bisphosphate carboxylase/oxygenase; Tucson, AZ, USA (20 Apr 1987).

An international workshop on the properties of the ribulose 1,5-bisphosphate carboxylase/oxygenase (Rubisco) and its involvement in photosynthesis was held in Tucson, AZ on April 20-25, 1987. Attending were 100 participants with 42 invited speakers coming from the US, Europe (England, France, West Germany, Sweden, Denmark), Japan and Australia. All aspects of this key enzyme in photosynthesis was discussed with much new information presented. New aspects on the regulation of CO_2 fixation activity was presented including the role of the Rubisco activase and 2-C-carboxyarabinitol 1-phosphate in intact leaves. The biochemistry of the protein subunits was discussed with emphasis on the function of the small subunit. Advances on the three dimensional structure with overlap of each active site on a neighboring subunit was described. The expression of the genes, similarities in the protein structure and their genetics was compared. Various aspects of the transport of the small subunit precursor into the chloroplast and its assembly into the holoenzyme were also discussed.

35973 **(DOE/ER/13743—1) Unraveling photosystem II: Progress report, July 1, 1987-February 1, 1988.** (Harvard Univ., Cambridge, MA (USA). Dept. of Biology). 1988. Contract FG02-87ER13743. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011522/JAW.

This project addresses the identification and characterization of thylakoid proteins and to understand their organization and function in photosynthesis. One segment of the work is to develop a reliable system for transforming, with foreign DNA, the cyanobacterium Synechocystis 6803 (S. 6803), which carries out oxygenic photosynthesis in the same manner as higher plants do and is a facultative photoheterotroph. The second part of the program deals with identifying photosynthetic genes coded by chloroplast DNA in higher plants. In the course of sequencing maize chloroplast DNA, unidentified open reading frames for proteins have been encountered. The protein products of these genes are found in photosynthetic membranes of chloroplasts and cyanobacteria; in some cases traced to a functional thylakoid complex. To date, two S. 6803 genes corresponding to chloroplast genes for hitherto unrecognized thylakoid proteins have been identified and cloned. Another objective of the development of the transformation-gene deletion-gene replacement system is to be able to study functions of parts of a protein.

35974 **(DOE/SR/00870—41) Vesicular-arbuscular mycorrhizae and the enzymatic utilization of inorganic phosphate by plant roots: Progress report 1985.** Marx, D. H. (Forest Service, Athens, GA (USA). Southeastern Forest Experiment Station). 1985. Contract AI09-76SR00870. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011508/JAW.

It is well known that phosphorus absorption, especially from soil with low phosphorus levels, by plant roots can be enhanced by mycorrhizal infection. Root cortical cells colonized by vesicular-arbuscular mycorrhizal fungi (VAM) have higher concentrations of phosphorus than noninfected cells. Polyphosphate is the major phosphorus reserve in many fungi and is reported to be present abundantly in young and proliferating arbuscules. We propose that mycorrhizal polyphosphate can be utilized by the VAM-plant symbiont system as a phosphorus donor and an energy source in the glycolytic pathway, possibly after being hydrolyzed to pytrophosphate (PPi). The VAM systems of infected and noninfected roots of sweetgum (Liquidambar styraciflua L.) and onion (Allium cepa L. var. Texas Grand) were used to compare the activity of PPI-dependent phosphofructokinase (PFK), an enzyme utilizing PPi to convert frutose-6-phosphate into fructosel,6-bisphosphate. The ATP-PKF activity was measured also. 1 fig., 3 tabs.

35975 **(DOE/SR/00870—43) Vesicular-arbuscular mycorrhizae and the enzymatic utilization of inorganic phosphate by plant roots: Progress report 1987.** Marx, D. H. (Forest Service, Athens, GA (USA). Southeastern Forest Experiment Station). 1987. Contract FG02-85ER45211. 6p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011506/JAW.

Whether the first-order lateral roots (FOLR) of tree seedlings is important in determining the competitiveness of individual sweet gums would be advantageous in a forest environment was investigated . We have hypothesized that large seedlings would have larger numbers of FOLR and thus would be more competitive. It was found however with half-sib sweetgum progeny that increasing seedling size through mycorrhizal fungi manipulation or through increasing fertility levels had no significant affect upon the number of FOLR. This suggested that FOLR might be under considerable genetic control and could, therefore, be of importance in predicting the future performance of an individual seedling.

35976 (IFU-B—08/86) Supervision and process technological optimization of the biogas plants Harrer and Trummer. Final report. Brunner, N.; Padinger, R. (Forschungszentrum Graz (Austria). Inst. fuer Umweltforschung). Apr 1986. 79p. (In German). Forschungszentrum Graz (Austria). Inst. fuer Umweltforschung.

The project 'Supervision Harrer/Trummer' is part of a comprehensive research programme in 6 biogas plants to evolve guidelines for rapid and reliable choice of the optimum rating and operational size of agricultural biogas plants. The project comprised the process technological supervision and optimization of the biogas plants 'Harrer' at Stenzengreith/Styria and 'Trummer' at Gnas/Styria during the years 1983, 1984 and 1985. The report describes all the activities conducted at the two biogas plants to the end of 1985 and summarizes the practical experience gained. (orig.) With 10 figs., 1 tab..

35977 (IFU-B—12/86) Setting up of a measuring system and implementation of a test and measurement programme at the biogas plant Spitzer. Final report. Padinger, R.; Brunner, N. (Forschungszentrum Graz (Austria). Inst. fuer Umweltforschung). Apr 1986. 28p. (In German). Forschungszentrum Graz (Austria). Inst. fuer Umweltforschung.

The project 'Measuring programme Spitzer' is part of an investigation programme in 6 biogas plants to evolve optimum rating and operation parameters for agricultural biogas plants. It comprises the setting up of a test programme for the biogas plant 'Spitzer' and the recording of all essential process parameters during the period of investigation September 1985 to December 1985. The biogas plant 'Spitzer' is equipped with a fermenting vessel made of steel in the form of a lying cylinder which is 7 meters long and 2.3 meters in diameter. The fermenting vessel thus has a capacity of about 30 cubic meters. In the longitudinal axis of the fermenting vessel there is the shaft of a stirring device with six paddels welded to it in helicoidal sequence. The biogas fuels a motor-and-generator unit (6 kilowatts/sub el/) for power generation. The waste heat from the motor-and-generator unit is used to heat the substrate in the fermenting vessel. The measuring values obtained during the short investigation period permit no exact forecast of the long-term operational behaviour of the biogas plant 'Spitzer'. Nonetheless, some essential properties of the biogas plants could be investigated. These make it possible to judge the plant in comparison with the remaining five biogas plants of the research project 'Comparative measurements in biogas plants'. (orig.RB) With 4 figs., 5 tabs..

35978 (IFU-B—21-85) Start-up processes in biogas plants. Pt. 2. Final report on stage 2 of the research project. Panholzer, M.; Scheucher, P. (Forschungszentrum Graz (Austria). Inst. fuer Umweltforschung). Aug 1985. 30p. (In German). Forschungszentrum Graz (Austria). Inst. fuer Umweltforschung.

Investigations were carried through on possibilities for shortening the normally very long start-up phases and for responding to functional disturbances in biogas plants by means of additives or start-up cultures. Commercial additives have proved inefficient. Nor is there any reason to expect that such additives will be developed in future. The use of start-up cultures from methane bacteria, too, which could accelerate fermentation, has proved to be not feasible, since the production and conservation of cultures in the quantities needed for practical purposes is too demanding on the one hand and since, on the other hand, no clearly positive effect can be observed. (orig.) With 10 figs., 3 tabs..

35979 (IFU-B—46/85) Implementation of a test and measuring programme at the Harrer biogas pilot plant. Final report. Padinger, R.; Brunner, N. (Forschungszentrum Graz (Austria). Inst. fuer Umweltforschung). Apr 1986. 38p. (In German). Forschungszentrum Graz (Austria). Inst. fuer Umweltforschung.

The 'Harrer measuring programme' is part of a research project in 6 biogas plants to evolve optimum rating and operational-size values for agricultural biogas plants. The project comprises the setting up of a test programme for the 'Harrer' biogas plant, and the recording of all essential process parameters during the period of investigation January '83 to December '85. The programme comprises measurements of the gross gas yield, the plant's own gas requirement, control of substrate quantities, temperatures, and pressures in different places of plant and pipes, as well as measurements of the electric power requirement and the hours of operation of different units. In addition, analyses of fresh substrate, of substrate in the fermenting vessel and substrate after fermentation, and gas analyses are carried through. The results and first evaluations are presented in this report. (orig./RB) With 18 figs., 7 tabs..

35980 (LBL—25042) Electron spin echo spectroscopy of photosynthesis. Britt, R.D. (Lawrence Berkeley Lab., CA (USA)). Mar 1988. Contract AC03-76SF00098. 214p. NTIS, PC A10/MF A01;1; GPO Dep. Order Number DE88009809/JAW.

The initial light-driven electron transfer event in plant photosynthesis creates an electron-deficient pigment molecule with sufficient oxidative potential to strip electrons from water. The water oxidation process is cyclic, with intermediate states designated S_0 through S_4. Each photooxidation of the primary pigment induces a transition in the cycle. Molecular oxygen is released after four photo-oxidation events, and the complex resets to the least oxidized state, S_0. The water oxidation chemistry is performed by a membrane-bound protein complex containing the transition metal manganese. The structure of the Mn complex has been partially characterized by x-ray spectroscopy and electron paramagnetic resonance (EPR). Details of the design and construction of a high-power pulsed EPR spectrometer to perform Electron Spin Echo (ESE) to do experiments on the Mn complex instrument are presented. We are interested in measuring the magnetic dipolar and electric quadrupolar parameters of paramagnetic nuclei magnetically coupled to the Mn complex. The ESEEM technique has provided details of the chemical environment of ^1H, ^2H, and ^{14}N nuclei in the vicinity of the photosynthetic Mn cluster. We discuss possible roles for coordinated imidizole in the functioning of the water oxidation complex. The increase in ^{14}N modulation may result from directly coordinated ammonia. ESEEM studies following incubation in ^2H_2O buffers indicate water coordination to Mn in the S_2 state. However, water does not bind to Mn during the $S_1 \rightarrow S_2$ transition. 210 refs., 76 figs., 2 tabs.

35981 (LBL—25145) Light regulation of the cell cycle and gene expression in Euglena gracilis bacillaris. Yee, Muhching. (Lawrence Berkeley Lab., CA (USA)). May 1988. Contract AC03-76SF00098. 146p. NTIS, PC A08/MF A01;1; GPO Dep. Order Number DE88010359/JAW.

Light regulation of the cell division cycle in the photosynthetic unicellular alga Euglena gracilis bacillaris was studied. By inoculating stationary phase, non-dividing cells into fresh media, and exposing the diluted cells to either light or darkness, it was determined that initiation of DNA synthesis is light dependent and requires continuous exposure to more than six hours of light. It is proposed that this is to allow the accumulation of an initiating factor that will enable DNA synthesis to begin. The initiating factor has a half-life of 5 hours in the dark. Flow cytometry analysis shows that once cells are committed to the cell cycle, they will complete the cycle in the dark. The levels of several photosynthetic messenger RNAs have been studied under alternating light-dark conditions and continuous light conditions. RNA levels for psbA, which encodes the Photosynthem II herbicide binding protein known as D1, display a strong circadian rhythm that persists for more than 3 days in continuous light. RNA levels for rbcL, which encodes the large subunit of ribulose 1,5-bisphosphate carboxylase, and for rbcS, which encodes the small subunit of that enzyme, have a shorter free-running circadian cycle. The chloroplast-encoded rbcL is more sensitive to cell cycle state because it does not accumulate in stationary phase cultures while the nuclear-encoded rbcS does accumulate.

35982 (NEI-DK—73) Proposal for activity plan for research programmes. (Dansk Brandvaerns-Komite, Birkeroed). Jan 1986. 49p. (In Danish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752916/JAW.

As a result of performed interviews and studying of literature the committee has concluded, that there is a special need for funding of basic research within parts of the following areas: - pro-

duction of biomass for energy purposes - energy conservation in connection with production and use of biomass - production of energy sources from biomass - conversion and storage of biomass energy - use of fuel produced from biomass. The committee recommend that as a part of evaluation of future projects, economic considerations will be carried out, based on current market conditions and expectations of the future development. (SM).

35983 **(PB—88-191689/XAB) Highly stocked coniferous stands on the Olympic Peninsula: chemical composition and implications for harvest strategy. Forest Service research paper.** Little, S.N.; Waddell, D.R. (Forest Service, Portland, OR (USA). Pacific Northwest Research Station). Oct 1987. 36p. (FSRP-PNW—384). NTIS, PC A03/MF A01.

This report presents an assessment of macronutrients and their distribution within highly stocked, stagnant stands of mixed conifers on the Quilcene Ranger District, Olympic National Forest, northwest Washington. These stands consisted of predominantly three species: western hemlock (Tsuga heterophylla), coast Douglas-fir (Pseudotsuga menzeisii), and western redcedar (Thuja plicata). Preliminary investigation suggests that the living crown contains a small portion of the nutrient capital on the site. Extracting this material from the site during harvest or site preparation should not pose a threat to future production of biomass. Bioassays suggested that no macronutrients were deficient for growth of Douglas-fir seedlings.

35984 **(SAND—87-2746C) Vacuum apparatus for a photovoltaic device fabrication laboratory.** Beavis, L.C. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 13p. (CONF-880415—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008116/JAW.

From European vacuum conference; Salford, UK (11 Apr 1988).

When fabricating photovoltaic cells, the final processing steps include depositing conducting metal layers and anti-reflective (AR) coatings on the cell. Conductors deposited include aluminum, titanium, palladium, silver, and metal nitrides and silicides. AR coatings include oxides of silicon, tantalum, aluminum, and titanium. In order to obtain maximum cell efficiency, the vacuum system must be designed to maintain the highest possible purity of deposited meterials and to prevent cells from being exposed to energetic radiation. Thermally evaporated source materials in vacua approaching UHV are preferred for this application. The design of a vacuum system optimized for producing photovoltaic cell applications and automated using a computer is described. 3 refs., 5 figs., 2 tabs.

35985 **(SAND—87-7025) Liquid metal thermal-electric converter electrode development.** Martinez, J.I. (ed.). (Sandia National Labs., Albuquerque, NM (USA)). Feb 1988. Contract AC04-76DP00789. 70p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88009252/JAW.

This report describes work done in support of distributed receiver technology development. Dish-electric systems are being pursued in an effort to circumvent the need for energy transport by providing for heat-to-electricity energy conversion by individual heat engines at the focal point of parabolic dish concentrators. The Liquid Metal Thermal-Electric Converter is an engine that can convert thermal energy to electricity without the need for moving parts. The report documents the results of contracted work in the development of a long-lifetime, high-performance electrode for LMTEC, including the materials prepared for it. 17 refs., 20 figs., 3 tabs.

35986 **(SAND—88-0865C) A comparison of the radiation tolerance characteristics of multijunction solar cells with series and voltage-matched configurations.** Gee, J.M; Curtis, H.B. (Sandia National Labs., Albuquerque, NM (USA); National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1988. Contract AC04-76DP00789. 7p. (CONF-8804122—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009468/JAW.

From 9. space photovoltaic research and technology conference; Cleveland, OH, USA (19 Apr 1988).

The effect of series and voltage-matched configurations on the performance of multijunction solar cells in a radiation environment was investigated. It was found that the configuration of the multijunction solar cell can have a significant impact on its radiation tolerence characteristics.

35987 **(SERI/PR—213-3291) Photovoltaic Measurements and Performance Branch: Annual report, FY 1987.** Matson, R.J. (ed.). (Solar Energy Research Inst., Golden, CO (USA)). Jan 1988. Contract AC02-83CH10093. 110p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number TI88001142/JAW.

The Photovoltaic (PV) Measurements and Performance Branch of the Solar Energy Research Institute (SERI) provides extensive PV materials, device, and component characterization, measurement, fabrication, and modeling research and support for the international PV research community in the context of the US Department of Energy's PV Research Program goals. This report summarizes the branch's progress from 1 October 1986 through 1 October 1987. The five technical sections present a succinct overview of the capabilities and accomplishments of the various research groups in the branch, namely, surface and interface analysis, materials characterization, devices and modeling, cell performance and electro-optical characterization, and advanced module testing and performance. The report highlights the main research projects completed in FY 1987, including more than 7000 measurements and tests of PV materials, cells, submodules, and modules, which resulted in more than 100 branch-originated journal and conference publications, in collaboration with or in support of about 130 university, industrial, government, and in-house research groups. 11 refs.

35988 **(SERI/STR—211-3214) Low-band-gap, amorphous-silicon-based alloys by photochemical vapor deposition: Final report, 1 October 1985--30 November 1986.** Baron, B.N.; Hegedus, S.S.; Jackson, S.C. (Delaware Univ., Newark (USA). Inst. of Energy Conversion). Feb 1988. Contract AC02-83CH10093. 28p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88001165/JAW.

Thin films of hydrogenated amorphous silicon-germanium alloys were deposited by mercury-sensitized photochemical vapor deposition using a novel photo-CVD reactor. Thin films of a-Si/sub 1-x/Ge/sub x/:H with 0 less than or equal to x less than or equal to 1 and 1.0 less than E/sub g/ less than 1.8 eV were deposited from mixtures of silane and disilane with germane and inert gas diluents at substrate temperatures from 160{degree} to 200{degree}C. Alloy films were characterized by measurements of photo- and dark conductivity, electron mobility-lifetime product, sub-band-gap absorption, and density of states. Dilution with hydrogen increased the photoconductivity to 10/sup {minus/5} Scm and mobility-lifetime product to 6 {times} 10/sup {minus/8} cm²V for alloys having a band gap of 1.4 eV.

35989 **(SERI/STR—211-3215) Device physics related to the granular nature of $CuInSe_2$ solar cells: Annual subcontract report, 1 April 1986-31 March 1987.** Sites, J.R. (Colorado State Univ., Fort Collins (USA). Dept. of Physics). Feb 1988. Contract AC02-83CH10093. 25p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88001159/JAW.

Several aspects of the impact of $CuInSe_2$ polycrystallinity on solar cell performance were investigated. Reflection measurements on a variety of $CuInSe_2$ layers and completed cells show large variations in both the magnitude and angular distribution of scattered light. Localized illumination reveals spatial variations in photovoltaic response which imply collection losses as high as 10%. Capacitance studies allow extraction of the density of extraneous electronic states at the diode junction. These decrease in reverse bias but increase under illumination and, hence, forward bias. A physical model of polycrystalline $CuInSe_2$ is presented, and finally the status of $CuInSe_2$ cells is analyzed in terms of the extent to which various factors are limiting performance.

35990 **(SERI/TP—211-3354) SERI's photovoltaic research project: A foundation for tomorrow's utility-scale electricity.** Mitchell, R.L.; Surek, T. (Solar Energy Research Inst., Golden, CO (USA)). May 1988. Contract AC02-83CH10093. 11p. (CONF-880702—12). NTIS, PC A03;3. Order Number DE88001161/JAW.

From 23. intersociety energy conversion engineering conference; Denver, CO, USA (31 Jul 1988).

This paper focuses on recent progress and future directions in PV research managed by SERI for the US Department of Energy (DOE). The primary emphases of the research are on thin-film single-junction and multijunction devices. However, work also continues on advanced crystalline silicon sheet materials. Improvements in materials and processing, solar cell design, and cell fabrication techniques have led to continuing improvements in cell efficiencies in nearly all material areas. Recent research has identified the criticality of source-material purity and device-processing conditions for different PV materials. Attention to total device design and processing has increased our understanding of metallic contacts, transparent conductors, and intermediate layers. Sophisticated models have been developed to quickly assess device concepts. Enhanced measurement and characterization techniques, along with increased interactions among PV scientists, are adding to the strong foundation of photovoltaics. Future directions in PV research are given in the recent Five Year Research Plan prepared by DOE. The plan is predicated on partnerships among the federal government, private companies, universities, and electric utilities. As part of a consensus review of the plan, this multifaceted PV community identified the specific technical goals and pertinent R & D needed for success. These technical goals and future research are described in detail.

35991 **(SERI/TP—231-3325) An outdoor test facility for the large-scale production of microalgae.** Johnson, D.A.; Weissman, J.; Goebel, R. (Solar Energy Research Inst., Golden, CO (USA); Microbial Products, Inc., Fairfield, CA (USA)). Mar 1988. Contract AC02-83CH10093. 12p. (CONF-880215—4). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88001146/JAW.

From Energy from biomass and wastes; New Orleans, LA, USA (15 Feb 1988).

The goal of the US Department of EnergySolar Energy Research Institute's Aquatic Species Program is to develop the technology base to produce liquid fuels from microalgae. This technology is being initially developed for the desert Southwest. As part of this program an outdoor test facility has been designed and constructed in Roswell, New Mexico. The site has a large existing infrastructure, a suitable climate, and abundant saline groundwater. This facility will be used to evaluate productivity of microalgae strains and conduct large-scale experiments to increase biomass productivity while decreasing production costs. Six 3-m² fiberglass raceways were constructed. Several microalgae strains were screened for growth, one of which had a short-term productivity rate of greater than 50 g dry wt m/sup {minus/2} d/sup {minus/1}. Two large-scale, 0.1-ha raceways have also been built. These are being used to evaluate the performance trade-offs between low-cost earthen liners and higher cost plastic liners. A series of hydraulic measurements is also being carried out to evaluate future improved pond designs. Future plans include a 0.5-ha pond, which will be built in approximately 2 years to test a scaled-up system. This unique facility will be available to other researchers and industry for studies on microalgae productivity. 6 refs., 9 figs., 1 tab.

35992 **(SLU-IVL—188) Large scale seasonal storage of tree fuel project. Summary of phase 1.** Thoernqvist, T. (Swedish Univ. of Agricultural Sciences, Uppsala. Dept. of Forest Products). 1986. 61p. (In Swedish). NTIS (US Sales Only), PC A04. Order Number DE88753336/JAW.

In the first phase chipped logging residues and chipped oak trunks were stored in 7 m high piles. The experiment covers eight treatments where the piles are stored for seven months both under cover and in the open as well as compacted and uncompacted. The results showed a moderate increase of the CO/sub2/-content in piles of oak chips. In uncompacted piles with logging residues the CO/sub2/-content rapidly rose to 20% and then slowly decreased. In compacted piles with logging residues the CO/sub2/-content remained between 15-20% throughout the storage period. The temperature in the piles with oak chips was about 10 degrees C above the temperature of the ambient air throughout the experimental period. In the piles with chipped logging residues the temperature was in the 60-100 degrees C range. However, during a three-week period temperatures above 300 degrees C were noted in the central lower parts of the compacted piles with chipped logging residues stored under cover. The moisture content in oak chips was about 36% at the start of the experiment and, as means, about 33% in piles stored outdoors and 24 and 28% respectively in piles stored under cover. The mean moisture content in the piles with chipped logging residues was between 40 and 46% at the start of the experiment. During the storage period the mean moisture content decreased to 23% in the pile stored uncompacted under cover and to 28% for the uncompacted piles in the open. The uncompacted oak chips showed a 3% increase in energy during storage whereas the other material showed energy losses of between 0 and 12%. The conclusion of the experiment was that chipped oak can be successfully stored in 7 m high piles for 7 months. It was also found that there is good economy in seasonal storage of chipped tree fuel.

35993 **(SLU-IVL-U—161) Preliminary results on chemical composition changes in stored forest fuels.** Jirjis, R.; Theander, O. (Statens Energiverk, Stockholm (Sweden)). 1986. 31p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752936/JAW.

The storage effect on the chemical composition of two types of fuel chips: forest residue and oak wood chips was investigated. The chips was stored in two piles, one indoors and the other outdoors. In each pile the chips was stored in two forms: compacted and uncompacted. Samples were taken from 10 defined points and analysed for cellulose, hemicellulose, Klason lignin and ash contents before and after seven months storage. Analyses of the main fractions of indoor stored forest residue showed that carbohydrates were more affected by storage than lignin. Wood and twigs fractions were the least affected by storage. The high temperature which developed in the compacted section was probably mainly responsible for degradation of the polysaccharides. Test points close to the surface of the section exhibited slight changes in the ratio of lignin/carbohydrates while central points, where the temperature reached up to 300 degrees C, showed clear increase in the lignin/carbohydrate ratio. The uncompacted section, stored indoors, showed similar results to those of the compacted section except for the wood fraction where at certain points the lignin/carbohydrate ratio declined after uncompacted storage. In the outdoor stored chips (compacted section) the ratio of lignin carbohydrate was increased in the needles and the bark. Uncompacted storage effect on needles and bark fractions was similar to that of compacted storage. Twig fractions in uncompacted storage changed insignificantly but the wood fraction showed consistently a lower lignin/carbohydrate ratio after storage at all the test points. The chemical composition of compacted and uncompacted oak wood chips was not significantly altered after seven months indoor or outdoor storage. Ash content in stored chips differed slightly from that of fresh chips. (authors).

35994 **(SLU-IVL-U—163) Spontaneous combustion in piles with comminuted wood fuel.** Thoernqvist, T. (Swedish Univ. of Agricultural Sciences, Uppsala). 1987. 26p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752937/JAW.

This report was prepared in order to summarize experiences of thirteen fires breaking out in piles of comminuted wood fuel. The method used was to interview by telephone representatives of the companies involved in order to obtain an opinion on the size of the spontaneously combusted piles and the composition of the material in the pile as well as the expenses involved as a result of the fire. In addition, the reason for the spontaneous self-ignition has also been analysed. The fuel volume in the thirteen piles which combusted during 1986/ 87 varied between 3000 and 93000 m/sp3/. The fires caused fuel losses ranging between 30 and 48000 m/sp3/ in the different piles. In six of the piles the losses ranged between 2500 and 6000 m/sp3/ wood fuel. The costs involved varied between 6000 SEK and 5.3 MSEK. In nine of the fires the costs were in the range from 100000 to 850000 SEK. The cause of the fires can probably be found in the different permeability in various parts of the piles. This assumption is supported by the fact that most of the

fires originated in the border area between different assortments of wood fuel or in the border area between compacted and uncompacted fuel. In two cases the centres of the outbreaks were localized to areas containing objects. In these cases the metal has been assumed to function as a catalyst. Recommendations for storage of comminuted wood fuel are given in the report.

35995 **(STEV-EO—87-4) Large scale experiments South - energy forest cultivation at southern Scania. Progress report.** Perman, G. (Statens Energiverk, Stockholm (Sweden)). Jan 1987. 29p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752946/JAW.

During this period the profitability of energy forestry has been evaluated. The production cost for energy forest chips is about 40 percent higher than that of forest residues. During the autumn we have observed severe damages of stemcancer in the plantations. We have also observed that the roots in the older forest plantations (three years) damage the drainage system in the soil. Through more effective harvest technique and planting material the energy forest can be profitable in the future.

35996 **(STEV-EO—87-5) Large-scale experiments South - energy forest cultivation at southern Scania. Progress report stage 4.** Perman, G. (Statens Energiverk, Stockholm (Sweden)). May 1987. 39p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752947/JAW.

The experience from the energy forest project shows that the economy today is not equivalent to traditional corn production. To achieve this better planting material and more effective harvest and chipping technique is necessary. This winter around 20 hectares have been harvested and chipped. The technique has functioned well but is not yet commercial. Burning tests at Simrishamn (4 MW) and at Hoegesta AB (500 kW) have given good results. The discussion about the surplus situation of the traditional corn production motivates increased efforts in energy forestry development.

35997 **(STEV-FGT—87-3) Gasification in circulating fluidized bed - gasification of crude bark, introductory tests with RDF and gas purification at bench-scale. Studsvik CFBG, Stage 2.** Ekstroem, C.; Blackadder, W. (Statens Energiverk, Stockholm (Sweden); Studsvik Energiteknik AB, Nykoeping (Sweden)). Mar 1987. 31p. (In Swedish). (STUDSVIK-EP—87-18). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752958/JAW.

The gasifier has been operated at pilot-scale and it exhibited a constant and very stable service. The quality of the gas was acceptable for the reburning kiln and the availability was high. Bench-scale tests of gas purification have been made with chips, dissociation of char and and NHsub(3) and absorption of Cl for a mixture of chips and PVC have been performed. Various RDF fractions have been used as fuel feed and the handling system has been tested.(GB).

35998 **(STEV-FGT—88-1) Peat - bio - gasification. Final report of stage 8.** Sjoestroem, K. (Statens Energiverk, Stockholm (Sweden)). 12 Nov 1987. 299p. (In Swedish). NTIS (US Sales Only), PC A13. Order Number DE88753340/JAW.

Work has continued with the demonstration units (LDU and LRU) including the new pressurized flash pyrolysis plant. Gasification of biomass fuel is being studied and the reactivity of char is investigated. The formation of tar during pyrolysis is characterized and its decomposition by means of dolomite has been performed. Sintering of catalysts has been observed. Simulation of gasification in fluidized beds has been performed. Mathematical models and their computer programs for combustion, catalysis, fluidized beds etc are presented. (G.B.).

35999 **(STU—82-3556) Example of energy conservation in greenhouses. Heat storage from day to night .** Gefvert, M.; Kjaerboe, P. (Swedish National Board for Technical Development, Stockholm). 28 Apr 1985. 12p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752974/JAW.

The report describes a system for daily storage/discharge of heat. The system is designed to catch as large a fraction as possible of the solar heat, while still offering an acceptable greenhouse climate. The system can be retrofitted to existing greenhouses.

36000 **(SU/FE—ENFOR51984) Nutrient cycling in willow.** Ericsson, T. (Environnement Canada, Ottawa, Ontario. Conservation et Protection). 1984. 32p. (CE—01460). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

The objectives of this paper were to summarize the state of knowledge regarding nutrient cycling in willow (Salix) plantations managed for energy purposes, identify the major gaps, and recommend further research. Nutrient requirements of intensively-managed willow plantations are high since production may range from 10 to 30 tonnes of stem biomass per hectare per year on fertile soils. The associated nitrogen required by plants to sustain such yields amounts to 200 to 600 kg per hectare when plantations are managed on one-year rotations. The production of stem biomass per unit of nitrogen taken up can be almost doubled by extending rotations longer than two years. Fertilizer requirements are highly dependent on the nutrient status of the soil and the microorganism activity. The need for fertilizers is also influenced by the choice of species, method of culture, frequency of harvest, and degree of plant utilization. The removal of nitrogen in the harvested stem biomass is from 3 to 8 kg per tonne; the lower value corresponds to harvest cycles longer than two years. Nutrient losses due to leaching will probably be small because of the perennial root system, provided that fertilizer is not applied in large doses. 61 refs., 13 figs., 12 tabs.

36001 **(TFB—1981) Biotechnology: a development plan for Canada.** (Task Force on Biotechnology, Ottawa, Ontario (Canada)). 1981. 51p. (CE—01441). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

The prospects for future industrial growth in Canada will depend primarily upon the pathways chosen for expanded economic development. One such pathway relates to the growth and development of high technology industries. One new area of high technology which offers significant opportunities for Canada is biotechnology. Biotechnology offers the opportunity to develop new industries as well as to revitalize established ones by the use of processes which, in the production of new or existing products, require significantly less energy than existing ones. For Canada the application of biotechnology to nitrogen fixation, novel aspects of cellulose utilization, the development of plant strains, the treatment and utilization of wastes and mineral leaching are major priorities for industrial development. Canada's current biotechnological efforts are characterized by a wide scattering of research activity in university and government laboratories and the absence of any major industrial activity. Therefore, a major effort is required to stimulate the growth of an industrial sector based upon biotechnology, and at the same time to promote a focussing of the country's research efforts in this area. In this regard, a long-term National Biotechnology Development Plan for Canada is proposed. This plan has eight elements which are the basis for recommendations made in this report. 1 fig.

36002 **(TYOT-JULK—292) Risk analysis of cutting work of the forest owners working in their own forests.** Maekijaervie, L.; Ihonen, M. (Tyotehoseuran Julkaisuja, Helsinki (Finland)). Dec 1986. 67p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752868/JAW.

This study, made at the Forestry Department of the Work Efficiency Association, is part of the joint Nordic project of the Nordic Research Council on Forest Operations (NSR) "The work environment of self employed owners" which was realized in the years 1984-86. The aim of the study was to adapt risk analysis based on video techniques for the cutting work, and evaluate the suitability of the method for investigation of cutting work. By means of the risk analysis, the number and causes of risk situations

of the forest owners and the members of the comparison group were found out in various operations and parts of the work. The comparison group consisted of seven forestry students who had had some training in cutting work. Thus the influence of training in cutting work on the risk situations was studied. The number of risk situations, found in the analysis, was compared with the accidents occurred and the reasons for differences were examined. On the basis of the results, proposals were made for the improvement of work safety.

36003 Specular $CuInSe_2$ films for solar cells. Birkmire, R.W.; McCandless, B.E. (Institute of Energy Conversion, University of Delaware, Newark, Delaware 19716). *Applied Physics Letters;* **53**: No. 2, 140-141(11 Jul 1988).

Specular $CuInSe_2$ films suitable for solar cell devices have been produced by etching the as-deposited films in an aqueous bromine solution. Structural analysis and device results indicate that the $CuInSe_2$ films are compositionally and electronically homogeneous even though the films are deposited in two distinct layers. The implications for improvements in $CuInSe_2$ cell and module performance are discussed.

36004 Positron annihilation spectroscopy of AlGaAs/GaAs interfaces in metalorganic chemical vapor deposition grown GaAs heterojunction solar cells. DeWald, A.B.; Frost, R.L.; Ringel, S.A.; Schaffer, J.P.; Rohatgi, A.; Nielsen, B.; Lynn, K.G. (Georgia Institute of Technology, Atlanta, Georgia 30332). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **6**: No. 4, 2248-2252(Jul 1988).

The defect density profile of high-efficiency epitaxial metalorganic chemical vapor deposition (MOCVD) grown GaAs heterojunction solar cell structures has been characterized using a variable-energy positron beam. Spatial defect changes, film thickness variations, and possibly interfacial space charge and disorder may be resolved from annihilation characteristics by control of the implantation depth of positrons. Correlations were made relating positron annihilation spectroscopy (PAS) measurements to surface photovoltage data, band bending, and known MOCVD growth parameter variations. Based upon these correlations, it is expected that PAS may provide a valuable means for probing defect profiles that may affect the electrical and optical response of MOCVD-grown semiconductor materials.

36005 Effects of heavy impurity doping on electron injection in p^+-n GaAs diodes. Klausmeier-Brown, M.E.; Lundstrom, M.S.; Melloch, M.R.; Tobin, S.P. (School of Electrical Engineering, Purdue University, West Lafayette, Indiana 47907). *Applied Physics Letters;* **52**: No. 26, 2255-2257(27 Jun 1988).

Measurements of electron injection currents in p^+-n diodes are presented for a range of p-type dopant concentrations. A successive etch technique was used to characterize the electron injection current in terms of the product (n/sub o/D/sub n/). Measurements are presented for Zn-doped GaAs solar cells with p-layer hole concentrations in the range 6.3×10^{17}-1.3×10^{19} cm^{-3}. The results demonstrate that so-called band-gap narrowing effects substantially increase the injected electron current in heavily doped p-type GaAs. These heavy doping effects must be accounted for in the modeling and design of GaAs solar cells and heterostructure bipolar transistors.

36006 Binding of hydroxylamine to the water-oxidizing complex and the ferroquinone electron acceptor of spinach photosystem II. Sivaraja, M.; Dismukes, G.C.;. (Princeton Univ., NJ (USA)). *Biochemistry;* **27**: No. 9, 3467-3475(3 May 1988). Contract FG02-84CH10199.

The reaction between spinach photosystem II (PSII) membranes and hydroxylamine has been investigated by equilibrium titrations and flash-induced reactions with electron paramagnetic resonance (EPR) spectroscopy to monitor the odd-electron species, O_2 evolution rate, and manganese binding. Two high-affinity sites for NH_2OH reaction have been characterized. Binding to the first site occurs within the water-oxidizing complex (WOC) and produces the well-known two flash shift in O_2 evolution. The usual two-electron shift in O_2 yield is accompanied by a parallel two-electron shift in the yield of the S_2 multiline EPR signal. The two flash delay in turnover seen at room temperature is lost at low temperatures (150-500 K) due to a block in multiple turnovers caused by NH_2OH. The site for the low-temperature blockage is undetermined but correlates with the structural change at the ferroquinone site. This suggests that the reoxidation of Q/sub A/$^-$ by Q/sub B/ following turnover is blocked, resulting instead in recombination upon warming. The reversible loss of both of the S_2-state EPR signals, the multiline and the g = 4.1 signals, caused by NH_2OH, titrated with identical curves, suggesting a common chemical reactivity and hence origin for these signals. The reaction between the S_2 state and NH_2OH occurs in less than 10 s and is considerably faster than binding to the (dark) SV3! state. The reversible binding of NH_2OH produces no stable paramagnetic products in the dark. The release of MN by NO_2OH is followed by reduction of the oxidized donor D^+ responsible for EPR signal II/sub slow/ and signal II/sub dark/, confirming earlier work establishing the accessibility of this donor to the aqueous phase through the Mn binding site.

36007 Experiments and analysis on the molten salt direct absorption receiver concept. Bohn, M.S.; Wang, K.Y. (Solar Energy Research Institute, Golden, CO 80401 (US)). *Journal of Solar Energy Engineering;* **110**: No. 1, 45-51(Feb 1988).

This paper presents results of experiments on the Direct Absorption Receiver (DAR) concept using molten salt as the working fluid. The DAR concept may result in a solar central receiver that costs 50 percent less than the current tube receiver and has significantly lower operational and maintenance costs. These experiments were aimed at determining whether the DAR concept is technically feasible. Results are based on several days of operating with solar flux ranging up to 50 Wcm^2 and also on a numerical model that is capable of predicting the thermal performance of the DAR salt film. Issues relating to thermal efficiency, absorber-to-salt heat transfer, and salt film stability are addressed.

36008 Photoinitiated charge separation in a carotenoid-porphyrin-diquinone tetra: enhanced quantum yields via multistep electron transfers. Gust, D.; Moore, T.A.; Moore, A.L.; Barrett, D.; Harding, L.O.; Makings, L.R.; Liddell, P.A.; De Schryver, F.C.; Van der Auweraer, M.; Bensasson, R.; Rougee, M. (Arizona State Univ., Tempe (USA)). *Journal of the American Chemical Society;* **110**: No. 1, 321-323(6 Jan 1988). Contract FG02-87ER13791.

Photosynthesis converts light to chemical potential energy in the form of long-lived charge separation across a bilayer membrane. Recombination of the charge-separated state is prevented by the large distance between the final electron donor and acceptor. Because the quantum yield of a single long-range electron transfer across the bilayer would be vanishingly small, reaction centers employ a series of electron-transfer steps, each of which occurs over a short distance with high yield. Synthetic carotenoid-porphyrin-quinone triad molecules and other molecular systems which begin to model this approach have recently been reported. In photosynthetic bacteria, the charge separation sequence includes electron donation from a bacteriopheophytin to a quinone which then transfers an electron to a second quinone. An elegant molecule that models such electron transfer has been prepared, although it did not reproduce the long-lived charge separation characteristic of the natural system. The authors now report the synthesis of a tetrachromophoric molecule 1 consisting of a porphyrin (P) covalently linked to both a carotenoid polyene (C) and a rigid diquinone moiety (Q/sub A/-Q/sub B/), excitation of which produces a long-lived (460 ns in dichloromethane, 4 μs in acetonitrile charge-separated state C/sup .+/-P-Q/sub A/-Q/sub B/$^{\bullet-}$ with a quantum yield of 0.23 at ambient temperatures and 0.50 at 240 K.

36009 **(DOE/AL/38869—T2) Photovoltaics for rural electrification in the Dominican Republic.** Hansen, R.D.; Martin, J.G. (Enersol Associates, Inc., Somerville, MA (USA); Lowell Univ., MA (USA)). 21 Aug 1987. Contract FG04-86AL38869. 150p. NTIS, PC A08/MF A01;1; GPO Dep. Order Number DE88007915/JAW.

Enersol Associates, Inc., has begun to structure a program for the introduction of photovoltaics in rural areas, and started to refer to this as the SOBASEC (SOlar-BASed Rural Electrification Concept) program. Throughout the report we have used the acronym SOBASEC to refer to the specific approach to electrification in rural areas with photovoltaics, as developed by Enersol Associates, Inc. This report documents the efforts to date and describes SOBASEC so that a variety of readers may benefit. This report provides an overall background on the Dominican Republic and a history of the project developed by Enersol in the Puerto Plata region. It describes the electric grid system that is owned and operated by the Dominican Government, and which serves urban dwellers and approximately 30% of the rural population. This paper is dedicated to describing the technical and institutional details of SOBASEC as developed by experience in implementing the program and installing the first 100 PV systems. Also discussed is the logical expansion that can take place with adequate financing and institutional support. This is done by describing a reasonable investment scenario. A key catalytic role of this financing is placed in the hands of the organizations that aim toward economic and social development in less developed countries. Recommendations and concluding comments on where this all may lead in the years to come is finally discussed. 61 refs., 59 figs.

36010 **(SERI/PR—211-3299) Photovoltaic Program Branch: Annual report, FY 1987.** (Solar Energy Research Inst., Golden, CO (USA)). Mar 1988. Contract AC02-83CH10093. 310p. NTIS, PC A14/MF A01;1; GPO Dep. Order Number DE88001155/JAW.

The PV Program Branch of the Solar Energy Research Institute (SERI) is responsible for managing the subcontracted portion of SERI's Photovoltaic Advanced Research and Development (PV AR&D) Project. In fiscal year (FY) 1987, this included more than 65 subcontracts, with a total annualized funding of approximately $15.7 million. Research was conducted in the following task areas: the Amorphous Silicon Research Project, Polycrystalline Thin Films, Crystalline Silicon Materials Research, High-Efficiency Concepts, the New Ideas Program, and the University Participation Program. The major portion of FY 1987's subcontracted research resulted from awards under six competitive solicitations initiated in FY 1986. 278 refs.

36011 **Utility application of photovoltaic power generation: A survey of recent literature.** Sugimura, R.S.; Wood, J.M. (Jet Propulsion Lab., Pasadena, CA 91109 (US)). *IEEE Transactions on Energy Conversion;* **EC-2**: No. 4, 563-569(Dec 1987).

A bibliography of recent documents on the subject of photovoltaic power generation for utility application is presented. The bibliography is divided into two subject areas: central station systems; and residential/intermediate systems.

36012 **(CONF-880282—1) Phase change problem related to thermal energy storage in the manned space station.** Wilson, D.G.; Drake, J.B.; Flanery, R.E. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 3p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011390/JAW.

From Institute for Mathematics and its Applications seminar; Minneapolis, MN, USA (23 Feb 1988).

The system discussed consists of a solar collector lined with small metal canisters filled with a high temperature phase change material (PCM), lithium fluoride salt. The canisters are small enough to fit comfortably in the palm of one's hand and there are a hundred or more of them. A heat transfer fluid, an inert gas such as helium or neon, circulates through the pipes that pass through the metal canisters and carries heat away to turbines, generators, etc. The continual melting and refreezing of the PCM smears out the delivery of the solar energy to the transfer fluid, and hence, to the heat engines beyond. The motivation for using a PCM based thermal energy storage system is that a properly sized such system can store and deliver energy over a narrow temperature range near the melting point of the PCM, thus avoiding extreme temperature variations.

36013 **(PNL—6129) Solar thermal bowl concepts and economic comparisons for electricity generation.** Williams, T.A.; Dirks, J.A.; Brown, D.R.; Antoniak, Z.I.; Allemann, R.T.; Coomes, E.P.; Craig, S.N.; Drost, M.K.; Humphreys, K.K.; Nomura, K.K. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. Contract AC06-76RL01830. 256p. NTIS, PC A12/MF A01;1; GPO Dep. Order Number DE88009236/JAW.

This study is aimed at providing a relative comparison of the thermodynamic and economic performance in electric applications for fixed mirror distributed focus (FMDF) solar thermal concepts which have been studied and developed in the DOE solar thermal program. Following the completion of earlier systems comparison studies in the late 1970's there have been a number of years of progress in solar thermal technology. This progress includes developing new solar components, improving component and system design details, constructing working systems, and collecting operating data on the systems. This study povides an update of the expected performance and cost of the major components, and an overall system energy cost for the FMDDF concepts evaluated. The projections in this study are for the late 1990's and are based on the potential capabilities that might be achieved with further technology development.

36014 **(SAND—87-2886C) Optical evaluation of prototype stretched - membrane mirror modules for solar central receivers.** Alpert, D.J.; Houser, R.M. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 11p. (CONF-880655—4). NTIS, PC A02/ MF A01; 1; GPO Dep. Order Number DE88011884/JAW.

From 4. international symposium on research, development and applications of solar thermal technology; Santa Fe, NM, USA (13 Jun 1988).

Under contract to Sandia National Laboratories, two independent studies were performed to develop a commercial-scale heliostat design and to assess the fabrication and costs of stretched-membrane heliostats. The studies, performed by Solar Kinetics, Inc., and Science Applications International Corp., concluded that stretched-membrane heliostats would cost between 15% and 20% less than comparable glass-mirror designs. As part of these studies, 50-square-meter prototype mirror modules were built and installed for testing at the Central Receiver Test Facility (CRTR) at Sandia. Major issues addressed in our testing program included the optical performance of the stretched-membrane mirror, the performance of the mirror's focus-control system in windy conditions, the performance of the defocus system, and the durability of the reflective film. The results of the evaluation indicate that the optical performance of SKI's first-of-a-kind mirror module is at least as good as that of current glass-mirror designs. In calm conditions, the mirror can be defocused to a convex focal length of -200 meters in 7 seconds. The optical performance on windy days is within Sandia's heliostat specifications. After 2 years of exposure, the reflective surface was generally in good condition, having a clean reflectivity of nearly 90%.

36015 (SAND—87-2910C) **Performance evaluation of large-area glass-mirror heliostats.** Alpert, D.J.; Houser, R.M. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 11p. (CONF-880655—3). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011883/JAW.

From 4. international symposium on research, development and applications of solar thermal technology; Santa Fe, NM, USA (13 Jun 1988).

Heliostats using glass-mirror reflectors have been built in sizes up to 200 square meters. These large-area heliostats are over three times bigger than second-generation heliostats and represent the culmination of DOE's second-generation heliostat development program. Using larger heliostats provides economies of scale resulting in lower costs per unit area. There is, however, a penalty in optical performance with using large-area heliostats. In addition, because of their size, large heliostats are more difficult to clean and could be more prone to damage by wind loading. To address these concerns, Sandia National Laboratories purchased two large-area heliostats, one from Advanced Thermal Systems (ATS) and the other from Solar Power Engineering Co. (SPECO), with reflective areas of 150 and 200 square meters, respectively. Both incorporate design improvements that were suggested but not employed during previous development programs. The heliostats were installed at the Central Receiver Test Facility (CRTF) for Sandia to test and evaluate. Tests were designed to provide a basis for comparing the performance of the heliostats against Sandia's specifications for optical performance and structural integrity. Specific issues addressed included: (1) quality of the reflective beam, (2) performance of the tracking and heliostat control system, (3) quality and pointing accuracy of the beam under wind loads, (4) efficacy of alternative methods for cleaning the mirrors, and (5) long-term durability of the mirror, drives, and support structure.

36016 **(SAND—87-2976C) Reflux heat-pipe solar receivers for dish-electric systems.** Andraka, C.E.; Diver, R.B. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 14p. (CONF-880702—1). NTIS, PC A03;3. Order Number DE88008671/JAW.

From 23. intersociety energy conversion engineering conference; Denver, CO, USA (31 Jul 1988).

The feasibility of competitive, modular bulk electric power from the sun may be greatly enhanced by the use of a reflux heat pipe receiver to combine a heat engine with a paraboloidal dish concentrator. This combination represents a potential improvement over previous successful demonstrations of dish-electric technology in terms of enhanced performance, lower cost, longer life, and greater flexibility in engine design. In the reflux (i.e. gravity assisted) heat pipe receiver, concentrated solar radiation causes liquid metal (sodium, potassium, or NaK) to evaporate. The vapor flows to the engine interface heat exchanger, where it condenses and releases the latent heat. The condensate is returned to the receiver absorber by gravity (refluxing), and distributed over the surface by gravity and/or capillary forces in a wick lining the receiver. It is essentially an adaptation of heat pipe technology to the peculiar requirements of concentrated solar flux, and provides many advantages over conventional heated tub receiver technology. This overview paper describes the current status and future plans for the US Solar Thermal Program reflux receiver development program at Sandia National Laboratories. Current work includes conventional mesh wick receivers, sintered metal wicks, and pool boiler receivers. The relative design merits and concerns of the different approaches and technology development test plans are discussed.

36017 **Closed loop thermochemical energy transport based on CO/sub 2/ reforming of methane: Balancing the reaction systems.** Fish, J.D.; Hawn, D.C. (Process Research Div., 6254, Sandia National Labs., Albuquerque, NM (US)). *Journal of Solar Energy Engineering;* **109**: No. 3, 215-220(Aug 1987).

The objective of the Closed Loop Efficiency Analysis (CLEA) Project at Sandia National Laboratories is to develop the data base, the calculational tools, and the operational experience necessary for the design of cost-effective energy transport systems based on reversible chemical reactions. The primary application of interest is the transport of solar energy either from the collectors of a distributed system to a central site or from a solar energy plant of any type located in an area of high solar insolation to a population or industrial center a few to several hundred kilometers away. A series of experiments and analysis have been carried out to explore the effect of catalyst selection, starting composition, reactor temperatures, system pressure, and water recycle on the operation and the efficiency of an energy transport-system based on the reversible carbon dioxide reforming of methane. Both the experiments in the CLEA laboratory facility and the analyses indicate that the carbon dioxide/methane thermochemical energy transport system can be operated in a stable, closed-loop mode and that the system can be started up and shut down, as it must be daily in a solar application, without triggering either catastrophic instabilities or carbon deposition. Based on the success of the CLEA project, two new hardware projects have been initiated to address scale-up and direct solar interfacing.

36018 **Receiver/reactor concepts for thermochemical transport of solar energy.** Diver, R.B. (Sandia National Labs., Albuquerque, NM (US)). *Journal of Solar Energy Engineering;* **109**: No. 3, 199-204(Aug 1987).

Thermochemical transport of solar energy based on reversible chemical reactions may be a way to take advantage of the high-temperature capabilities of parabolic dishes, while minimizing pipe network heat loss, since energy is transported at ambient temperatures in chemical form. Receiver/Reactor design is a key to making thermochemical transport a reality. In this paper the important parameters for solar receiver and chemical reactor design and how they relate to each other are presented. Three basic receiver/reactor types, applicable to thermochemical receiver design, are identified: (1) Tube Receiver/Reactors have tubular reactor elements which are directly heated by solar energy in the receiver. (2) Indirect Receiver/Reactors use an intermediate heat transfer fluid between the receiver and reactor. (3) Direct Absorption Receiver/Reaxtors absorb sunlight directly on the reactor catalyst. Advantages, limitations, and risks associated with each design are discussed and examples of those that have been built are given. Each type offers its own set of advantages and risks, and warrant further investigation.

36019 **Energy and availability transport losses in a point-focus solar concentrator field.** Stine, W.B.; Heckes, A.A. (Mechanical Engineering Dept., California State Polytechnic Univ., Pomona, CA (US)). *Journal of Solar Energy Engineering;* **109**: No. 3, 205-209(Aug 1987).

This paper presents the results of an experimental study of the losses in transporting thermal energy from a field of 114 point-focus solar collectors to a central thermal energy conversion system at the Solar Total Energy Project (STEP), Shenandoah, Georgia. Conduction and convection heat losses from the collector field piping and solar collector receivers and radiant energy losses from the solar collector receivers were measured. At normal operating conditions the steady state heat losses per unit of collector aperture area are 130 W/m/sup 2/ (41 Btu/hr-ft/sup 2/). The thermal mass of the collector field was found to be 3.92 KWh/°C (7,440Btu/°F), which implies that 17 percent of the energy collected on a typical day is used to warm the field piping to its operating temperature. The loss of availability from the collectors and the field piping shows that only 21 percent of the available solar energy falling on the collector field is delivered to the power cycle for conversion into electricity.

36020 **Performance/economics comparison of sensible and thermochemical energy transport systems for solar thermal dish applications.** Muir, J.F. (Sandia National Labs., Albuquerque, NM (US)). *Journal of Solar Energy Engineering;* **109**: No. 3, 227-234(Aug 1987).

A major challenge facing the development of distributed receiver solar systems is the efficient transport of high temperature thermal energy from the collectors to the point of use. As receiver temperatures increase, conventional sensible (SEN) energy transport methods become less attractive because of increased heat losses and insulation costs. A promising alternative that is particularly attractive for the high temperatures characteristic of paraboloidal dishes and the extensive piping associated with large collector fields is the concept of thermochemical (TC) energy transport. Estimates of the performance and economics of 4 SEN and 2TC transport systems for a dish collector field are compared at 4 delivery temperatures ranging from 400 to 815°C. On the basis of levelized energy cost (LEC), there is no clear choice between SEN and TC energy transport at 400°C. At higher output temperatures, TC transport is more cost-effective and is the only viable choice at tem-

peratures above —700°C. The TC system based on the carbon-dioxide reforming of methane has the best performance and lowest costs at temperatures >400°C and appears closest to meeting the DOE Solar Thermal Technology (STT) Program long-term IPH goal of 3 cents/kWH/sub th/ (9$/MBtu/sub th/) LEC.

36021 **Direct absorption receiver system for high temperature.** West, R.E. (Dept. of Chemical Engineering, Univ. of Colorado, Boulder, CO (US)). pp 361-373 of Solar energy utilization. Yuncu, H.; Paykoc, E.; Yener, Y. Hingham, MA; Martinus Nujhoff Publishing (1987). (CONF-8606348—).

From Solar energy utilization; Izmir, Turkey (23 Jun 1986).

A design study for a 900°C, direct absorption, solar central receiver concept has been performed. The eutectic mixture of sodium, potassium, and lithium carbonates was the heat absorbing fluid. This molten salt has several desired properties but is corrosive at 900°C, so that finding suitable materials of construction is one of the key problems in developing this technique. Such research, development, and design issues as flow and heat-transfer characteristics of the film, cavity layout, and downcomer piping design are discussed. The overall performance of the system has been predicted, based on current knowledge, and these results are presented.

36022 **Thermochemical energy transport for solar thermal dish applications: Component analysis.** Reilly, H.E. (Sandia National Labs., Albuquerque, NM 87185 (US)). pp 1728-1732 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—). Contract AC04-76DP00789.

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879335.

Thermochemical energy transport has been proposed as a means to reduce the energy losses associated with delivering solar energy from a field of solar receivers to a central use point. This paper presents an analysis of the recuperative heat exchangers that would be used in a field of solar parabolic dish collectors interconnected by a thermochemical transport system. The thermochemical system analyzed is the carbon dioxide reforming of methane. These system analyses are being performed in conjunction with the design and construction of the Closed Loop Operations Experiment (CLOE), a field-scale CO_2CH_4 thermochemical transport experiment to demonstrate the viability of the concept. The scope of this effort includes a determination of recuperator heat loss as a function of recuperator effectiveness at design conditions; modeling of the recuperator and solar receiver in order to estimate annual recuperator heat loss as a function of effectiveness; and relating recuperator effectiveness and cost.

36023 **Reflux heat-pipe solar receiver for a Stirling dish-electric system.** Ziph, B.; Godett, T.M.; Diver, R.B. (Stirling Thermal Motors, Ann Arbor, MI 48104 (US)). pp 1733-1738 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—).

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879402.

The feasibility of competitive, modular bulk electric power from the sun is enhanced by the use of a reflux heat-pipe receiver to combine a Stirling engine with a paraboloidal dish concentrator. This combination represents a potential improvement over previous successful demonstrations of Stirling dish-electric technology in terms of enhanced performance, lower cost, and longer life. In the reflux (i.e. gravity assisted) heat-pipe receiver, concentrated solar radiation causes liquid sodium to evaporate, the vapor flows to the Stirling engine heaters where it condenses on the heater tubes. The condensate is returned to and distributed over the receiver by gravity (refluxing) and by capillary forces in a wick lining the receiver. It is essentially an adaption of sodium heat pipe technology to the peculiar requirements of concentrated solar flux and provides many potential advantages over conventional tube receiver technology. This paper describes the preliminary design of a reflux heat-pipe solar receiver to match the STM4-120 variable swashplate Stirling engine to a Test Bed Concentrator at Sandia National Laboratories Distributed Receiver Test Facility. Performance analysis and other design considerations are presented and discussed.

1409 Solar Thermal Utilization

36024 **(BFR-R—61-1986) Solar heating for detached houses. Domestic hot water heating and space heating.** Ellehauge, K.; Kristensen, P.E.; Hultmark, G. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 59p. (In Danish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752884/JAW.

The objective of this work has been to test, at the Lyngby Institute of Technology in Denmark, a solar heating system intended to supply both space heating and domestic hot water for detached houses. A complete system has been built and the energy consumptions of a detached house have been simulated. The basic idea of the system that has been tested is that it should incorporate a technology tank which would be factory built. The tank would have a modest volume, which could then be increased at site as required without needing advanced equipment. The installations has been operated outdoors for a period of seven weeks. Weekly thermal energy balances for the test period are included in the report. Several component and system parameters have been monitored: solar collector efficiency, store losses, interaction between the technology tank and the heat store, efficiency of the heat exchanger and heat transfer between the water in the store and domestic hot water. The report is concluded with a consideration of possible lines of development. (authors).

36025 **(BFR-R—71-1986) Rock heat well with an air heat collector. Field trials of performance and combined power output.** Tollin, J. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 19p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752887/JAW.

Between August 1984 and August 1985 an older detached house which had been heated by a rock heat source since October 1980 was complemented with a simple air heat collector. The collector has been used to recharge thermal energy into the rock and to serve as a parallel heat source when the heat pump is in operation. The collector is in the form of a cylindrical hose bundle, with an external diameter of 165 cm and a height of 112 cm, made up of 186 m of 25 mm diameter black polyethane hose. Corrugation of the external surface of the hose has increased its area by about 50 percent. During the year in which performance has been monitored, the collector has supplied about 6050 kWh of heat, of which 50 - 75 percent has been supplied to the rock and the reminder has been utilized directly in the heat pump. The collector has not resulted in any significant increase in the temperature of the heat source, or in any improvement in operating economics, during the December-March period. During the reminder of the time, however, the collector has resulted in an increase in temperature of about 1-3 K during the spring and autumn, and of about 4-6 K during the summer. With a single-well system such as this, it is probably generally more cost-effective to invest the money in deepening the well instead of installing an air heat collector.

36026 **(BMFT-FB-T—86-215) Application-oriented studies of evacuated tubular collectors. Final report.** Schreitmueller, K.; Reitz, H.J.; Rockendorf, G.; Vanoli, K. (Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)). Dec 1986. 194p. (In German). NTIS (US Sales Only), PC A09. Order Number DE88752639/JAW.

The operational behaviour of evacuated tubular collector (ETC) systems is fairly well known up to temperatures of appr. 90degC. However, for know-how and technology transfer and in order to extrapolate to higher temperatures both experimental investigations of the involved components and systems and the development of user-friendly design methods are necessary. The thermal losses of several types of ETC have been measured with absorber temperatures of up to 300degC and possible degradations investigated. Of special interest for the envisaged test facility for solar indus-

trial process heat are the investigations of the dynamic processes within the collector fields and storage tanks. A design method, basing on analytically determined input-/output-diagrams, and which may be applied both to DHW, IPH, and district heating systems, is presented. Finally, the proposal for a short-time test method for solar DHW systems is presented. The results show clearly the high importance of ETC (with or without CPC) in the 60...200degC temperature range. 36027 (EMR—EMR12) Catalogue of solar heating products and services in Canada. Argue, R. (Department of Energy, Mines and Resources, Ottawa, Ontario (Canada). Renewable Energy Resources Branch). Feb 1977. 112p. (CE—01494). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This catalogue is an attempt to identify the private sector's activity in the solar heating field in Canada. Over one hunderd and fifteen individuals and businesses that offer services in solar space heating, solar water heating or solar pool heating are identified. Altogether there are more than fifty companies that manufacture, distribute or will fabricate on-site solar heating systems and components. Of these, one third offer off-the-shelf units which they manufacture in Canada. Another third distribute components imported into Canada, mainly from the U.S. More than twenty design companies supply or manufacture on-site solar heating equipment. Roughly seventy companies are listed which supply engineering or architectural design services or information for solar heating of buildings. The introduction outlines the principles of the various basic types of solar heating systems, their applicability to Canada, and calculations of their economic benefit. A bibliography of books and periodicals related to solar heating is included. 40 figs.

36028 (EUR—9913-FR) Conception, construction and in-situ testing of a cold store powered with solar energy using a zeolite-water binary fluid. Conception and construction of a solar powered ice-maker using the activated carbon-methanol pair. Final report. Grenier, P.; Guilleminot, J.J.; Meunier, F.; Pons, M. (Commission of the European Communities, Luxembourg. Directorate General Information Market and Innovation). 1985. 63p. (In French). Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Energie.

This final report presents results of a study which had two objectives: - test the feasibility of the zeolite-H_2O pair to medium size solar powered cold stores, - find a new pair so as to realize a solar powered ice-maker. The work presented in this report enables us to give some conclusions. The zeolite-water pair allows to build solar powered units ranging from small individual refrigerators (for camping or for vaccine storage) to medium size cold stores. In our study, we did not notice any important size effect between our small units and the 12 m^2 (with 20 m^2 solar collectors) unit. The activated carbon-methanol pair can be used as well as the zeolite-water pair for conservation at +5°C: we think that it is after a value analysis study that a good choice between the two pairs will be possible. But more over, the activated carbon pair can be used to fire a solar powered ice-maker. The scale which seems to be realistic for the application of this pair ranges from very small units to units producing somes hundreds of kilogrammes (or some thousands) of ice per day.

36029 (EUR—10205-EN) European Modelling Group: Solar space heating and domestic hot water systems. Final report. McGrath, E. (Commission of the European Communities, Luxembourg. Directorate General Information Market and Innovation). 1985. 202p. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Energy.

This report covers the work performed by the UK participants in the European Modelling Group (EMG) from July 1981 to June 1983. Eight countries were involved in this coordinated project. The aim was to develop and test a detailed simulation model capable of predicting the performance of a wide range of solar space heating and domestic hot water systems in a range of climates typical of Europe. This model would bring together each participant's experience with their own simulation models in the previous work of the EMG. Having developed the model it would be used in studies of various systems. At the same time, the available simplified methods would be examined and from these a number would be improved and developed in order to produce a European simplified method.

36030 (EUR—10512-EN) Solar pilot test facility - a powerful tool for model validation and solar system development. Final report. Backer, G. (Commission of the European Communities, Luxembourg. Directorate General Telecommunications, Information Industries and Innovation). 1986. 305p. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Energy.

Although the participants of the European Solar Pilot Test Facility Group (SPTF) have reported the results of their research work individually, it seemed opportune to produce a final report of the Group as a whole. In this final report, to which all the participants of the SPTF-Group have contributed, common aspects of the work of the Group as well as the results of individual experiences are reported. The report shows, as the title says, how powerful this type of facility is for model validation as well as for system development.

36031 (MEM/CRE—061983) Solar heated swimming pool. (Manitoba Dept. of Energy and Mines, Winnipeg (Canada). Conservation and Renewable Energy Branch). Jun 1983. 6p. (CE—01435). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

The Town of Winkler, Manitoba, received funding to assist in the installation of an active solar water heater for the public swimming pool. Solar heat gain is accomplished by pumping pool water through a 1,525 m (5,000 ft) coil of one-inch black polyethylene plastic pipe. The heated water is then returned to the pool through the filtering system. The design is very simple, low cost and requires minimal maintenance. The town has experienced an approximate 40% reduction in natural gas fuel requirement for heating the pool. This savings would give a simple payback on the $2,200 (1980) cost in about two years. This report describes the Winkler pool heating system and makes some recommendations for improvement of the operation. 3 figs.

36032 (PB—88-183215/XAB) Passive solar commercial buildings: four Norwegian case studies. Hestnes, A.G. (SINTEF, Trondheim (Norway)). 9 Nov 1987. 27p. (STF—62-A87011). NTIS, PC E04/MF E04.

The purpose of the project is to identify exemplary nonresidential buildings with innovative passive solar and daylighting techniques, and to evaluate the performance of these buildings in terms of energy, economy, and function using available data. The report describes the four Norwegian buildings used as case studies in the Passive Solar Commercial Buildings project within the International Energy Agency's Solar Heating and Cooling Program.

36033 (PB—88-183223/XAB) Solar houses at Heimdal: five years of experience. Hestnes, A.G.; Gunnarshaug, J. (SINTEF, Trondheim (Norway)). 13 Nov 1987. 10p. (STF—62-A87012). NTIS, PC E03/MF E03.

This paper describes three solar dwellings built as part of a major research project on energy conservation in Norwegian dwellings - the Heimdal project. The overall objective of the project, which consists of fourteen dwellings, was to demonstrate and evaluate the effect of various energy-conservation measures and the use of alternative energy sources in typical Norwegian single-family dwellings.

36034 (S—SOLWAT5) Development of institutional size pre-engineered solar DHW systems. Swartman, R.K.; Dobbin, W. (Solcan Ltd., London, Ontario (Canada)). May 1983. 41p. (CE—01426). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

The objective of this work was to develop designs for a series of pre-engineered solar hot water systems suitable for institutional, commercial, and industrial applications. Six common hot water loads between 2,500 and 14,750 liters per day are selected for various institutional applications, including restaurants, schools, and nursing homes. Both F-chart and WATSUN III computer simulations were performed for the systems using the appropriate load profile for each application. The parameter of major interest was the ratio of effective surface area of the solar collector to the heating load. Solar hot water systems were then designed for each load, with 3 collector area options offering 3 different solar contributions for each load. The pre-engineering of the systems included selection of components and the design of freeze protection and other plumbing features. 14 figs., 2 tabs.

36035 Builder guidelines. Balcomb, J.D. (Solar Energy Research Institute, 1617 Cole Blvd., Golden, CO (US)). pp 403-405 of Proceedings of the 12th passive solar conference. Andrejko, D.A.; Hayes, J. Boulder, CO; American Solar Energy Society (1987). (CONF-870711—).

From Solar '87: 12th national passive solar conference; Portland, OR, USA (12 Jul 1987).

The Builder Guidelines project seeks to provide booklets that will help builders in designing highly energy efficient passive solar houses. The concept follows from the Solar Showcase in New Mexico reported at the 8th Passive Solar Conference. The Guidelines are packaged in two booklets, each about 20 pages long. The first contains performance target levels and design guidance; the second contains computation worksheets and performance tables. Both relate to a specific locality within which the heating or cooling degree days vary by no more than 10%. The techniques for developing target levels for a locality and the worksheet analysis procedure are discussed. These are based on the Los Alamos Solar Load Ratio method, a new simplified cooling load method, and a method of balancing conservation and passive solar that accounts for the summer cooling consequences of the passive design. The background, current status, and future plans of the project are described.

36036 Energy signatures: New results. Lekov, A.; Balcomb, J.D. (Solar Energy Research Institute, 1617 Cole Blvd., Golden, CO (US)). pp 310-313 of Proceedings of the 12th passive solar conference. Andrejko, D.A.; Hayes, J. Boulder, CO; American Solar Energy Society (1987). (CONF-870711—).

From Solar '87: 12th national passive solar conference; Portland, OR, USA (12 Jul 1987).

Energy signatures is a new instructive design tool for selecting and sizing passive solar elements in a building. This paper extends previous work. The objective function is generalized to include terms for the initial cost of each passive solar element and for future energy cost in addition to the thermal comfort term considered in the previous paper. Optimization equations are given, and a simple example is presented to illustrate the nature of the results.

36037 Thermal performance of advanced glazings: Predictions based on the FSLR method. Christensen, C. (Solar Energy Research Institute, 1617 Cole Boulevard, Golden, CO 80401 (US)). pp 134-139 of Proceedings of the 12th passive solar conference. Andrejko, D.A.; Hayes, J. Boulder, CO; American Solar Energy Society (1987). (CONF-870711—).

From Solar '87: 12th national passive solar conference; Portland, OR, USA (12 Jul 1987).

A simple method is presented for predicting heating performance of nonstandard glazing types in direct gain buildings. The method extends solar load ratio (SLR) calculations by use of modified building and climate parameters to account for nonstandard glazing characteristics. Results are given for a range of glazing types, climates, and building types (conventional, superinsulated, and passive solar). Predicted net energy savings (relative to double glazing) are 30-60 kBtu/ft/sup 2/ yr for glazings with suspended plastic films and low-emittance or, in some cases, antireflectance coatings. Further savings of approximately 10-30 kBtu/ft/sup 2/ yr are possible, particularly for south glazings, with the use of low-iron glass and a low-conductance gas fill. For an evacuated glazing, predicted net energy savings are 60-80 kBtu/ft/sup 2/ yr, superior to all other glazing types analyzed and approximately two to ten times better than other glazing types do not require the use of suspended plastic films.

36038 (BFR-R—52-1986) Convection suppressing devices in solar collectors. A theoretical and experimental investigation. Loefving, S. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 30p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752882/JAW.

This report discusses the performance of solar collectors incorporating various types of convection suppressing devices. A model which enables the efficiency graph to be calculated, in terms of both optical and thermal efficiency, is presented. A series of performance measurements that were made by the Swedish Testing Institute of the efficiency of a number of solar collectors fitted with various types of convection suppressing devices, together with measurements made at the Aelvkarleby laboratory of the Swedish State Power Board of the thermal resistance of a simulated solar collector fitted with a greater number of variations of convection suppressing devices, are also presented. The results of the investigation and of the measurements can be briefly summarised as follows: - Using present-day manufacturing methods, classic anti-convection baffles of honeycomb type, and similar baffles, are too expensive to manufacture to be considered for use in solar collectors. - In terms of corrugated thermal resistance, the performance of solar collectors fitted with corrugated films as anti-convection baffles is comparable with that of collectors fitted with one or two flat films. - As reflection losses are lower for a properly corrugated film than for a flat film, collector performance is improved if a film is used compared to one or two flat films.

36039 (PB—88-186390/XAB) Feasibility study of seasonal thermal storage in solar-heating systems for southern climates. Kenisarin, M.M.; Karabaev, M.K.; Lund, P.D. (Helsinki Univ. of Technology, Espoo (Finland). Dept. of Technical Physics). 15 Dec 1987. 25p. (TKK-F-A—617). NTIS, PC E03/MF A01.

Numerical computer simulations of solar district-heating plants with seasonal thermal storage for Tashkent conditions are discussed. A water pit is considered as the storage medium. The effects of different collector absorber-surface types and of water-pit top thermal insulation are investigated. Optimum relationships between collector area and storage volume are presented. It is shown that, in southern climates, a solar fraction of 50-60% can be achieved at lowest solar component cost for a central solar heating plant with seasonal thermal storage. A short review of the various basic concepts for seasonal thermal storage is also presented.

36040 (SAND—87-2619C) Heat transfer modeling of the IEA/SSPS [International Energy Agency/Small Solar Power Systems] volumetric receiver. Skocypec, R.D.; Boehm, R.F.; Chavez, J.M. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 16p. (CONF-880724—15). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007589/JAW.

From 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference; Houston, TX, USA (24 Jul 1988).

A wire-pack volumetric receiver was tested in 1987 in Almeria, Spain, by the International Energy Agency/Small Solar Power Systems (IEA/SSPS). Although the experiment goal was strictly

proof-of-concept and was not receiver characterization, modeling efforts were initiated to help understand the experimental results. The steady-state performance and comparisons to experimental data are presented. The model allows an absorber design to be thermally characterized and optimized based on solar energy transfer characteristics and temperature distributions in the receiver. Model predictions of receiver power and efficiency are generally higher than the test results (operational modifications are believed to have produced nonideal conditions), but trends are consistent with experimental data. 12 refs., 5 figs.

36041 (SAND—87-2875C) Direct absorption receiver flow testing and evaluation. Chavez, J.M.; Tyner, C.E.; Couch, W.A. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 11p. (CONF-880655—5). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011914/JAW.

From 4. international symposium on research, development and applications of solar thermal technology; Santa Fe, NM, USA (13 Jun 1988).

Flow testing has been conducted, at lengths up to 10 m, to investigate fluid stability concerns, effects of panel tilt, manifold designs, and control issues in a direct absorption receiver (DAR). The heat-absorbing fluid (a blackened molten nitrate salt) in a DAR flows in a thin, wavy film down a flat panel (rather than through tubes) and absorbs the concentrated solar flux directly. The DAR offers numerous potential performance and economic advantages when compared to a fluid-in-tube receiver for production of electricity. Water flow testing has demonstrated that relatively large waves develop as fluid flows down the panel and that large droplets of water are ejected from wave crests on long vertical panels at high flow rates. Various panel surface treatments and panel tilt have shown potential in reducing wave size and thus the amount of fluid loss. However, even a small amount of fluid loss in unacceptable on a DAR. We have designed and are building a solar panel research experiment (PRE) to conduct salt flow testing and solar DAR characterization. Based on results of the water flow testing, the initial test of the PRE system will be a 10 m-long molten salt flow test to verify the flow characteristics of salt versus those of water. We expect to begin testing in late 1988.

36042 (SAND—88-0234C) Planarization of metal substrates for solar mirrors. Ashley, C.S.; Reed, S.T.; Mahoney, A.R. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 4p. (CONF-8804114—4). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011492/JAW.

From Better ceramics through chemistry III; Reno, NV, USA (5 Apr 1988).

The planarizing ability of sol-gel films was investigated on several as-rolled stainless steel substrates. The smoothing effect afforded by the films was evaluated, using optical techniques, following deposition of silver over the planarized substrates. The specular reflectance of various substrates, initially ranging from 0.36 to 0.90, could be improved to final reflectance values of {approximately}0.93 with sol-gel processing. This process is being used to prepare prototype foil mirrors for evaluation in the next generation of solar concentrators.

36043 (SERI/TP—253-3324) Performance sensitivities for point-focus dish systems with secondary concentrators. Lewandowski, A.; O'Gallagher, J. (Solar Energy Research Inst., Golden, CO (USA); Chicago Univ., IL (USA). Enrico Fermi Inst.). Apr 1988. Contract AC02-83CH10093. 7p. (CONF-880615—1). NTIS, PC A02;3. Order Number DE88001152/JAW.

From Solar '88: American Solar Energy Society annual meeting and 13th national passive solar conference; Cambridge, MA, USA (18 Jun 1988).

This paper describes an analytical study of several performance--related benefits of using a secondary concentrator in point-focus dish designs. Previous research efforts have shown that design-point performance of dishes can be improved with secondary concentrators, especially for dishes with higher optical errors or at higher receiver operating temperatures. This work addresses the sensitivity to changes in design-point parameter values corresponding to both tracking and optical errors. An anlytical model and a ray-trace model were used in analyzing these sensitivities. Results indicate that properly designed secondaries can significantly increase the tolerance to tracking errors and decrease the sensitivity to changes in optical errors from design-point values. Two approaches are recommended on which to base the design of the secondary. 4 refs., 7 figs.

36044 (SERI/TR—255-3242) Specular steel surfaces for solar mirror substrates. Tracy, C.E.; Gross, G.E. (Solar Energy Research Inst., Golden, CO (USA)). Apr 1988. Contract AC02-83CH10093. 45p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88001153/JAW.

The long-range objective of this task is to develop a process for making a silvered stainless steel mirror that has the optical performance and service life of a silvered glass mirror coupled with the mechanical durablilty, structural strength, and flexibility of sheet steel. Such reflectors are expected to minimize the cost handling, shipping, and fabrication into concentrators. Applications for helistats are assumed to require a lifetime average reflectance of 90% in a full-cone aperture angle of 8 mrad. Specifically, this work is designed to produce thin metal membranes with sufficiently fine surface finishes to serve as substrates for direct silver deposition or indirectly for silvered polymer films or silvered sol-gel coatings in heliostat, parabolic trough, and dish applications. Our focus is on the effect of the sheet metal finish on specularity and the ways to obtain the optimum surface finish by conventional manufacturing processes. This report addresses the relationship of optical quality to surface finish and the results of a cooperative research venture with a commercial sheet manufacturer to produce specular stainless steel surfaces by cold-rolling with highly polished rollers. 14 refs., 13 figs., 4 tabs.

1420 Heat Storage

REFER ALSO TO CITATION(S) 36007, 36039, 36459

36045 (BFR-R—84-1986) Sunclay project. Performance assessment of the Sunclay system: Second generation system design. Graeslund, J.; Hultmark, G.; Olsson, S.; Rudholm, B. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 146p. (In Swedish). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88752891/JAW.

The Sunclay project is the name given to the heat production system for the Lindaelv school in Kungsbacka, about 30 km south of Goeteborg. Heat is supplied to a secondary school having 800 pupils. The school is a single-storey building, wiwth a floor area of 15000 m/sub2/, incorporatiang facilities for teaching, administration, food preperation, physical recreation, theatre and sparee time activities. Indoor temperatures are maintained constant at + 20 degree C throughout the day. The Sunclay systems involves storage of solar energy from summer to winter in clay. Solar enerrgy is used as the heat source for diesel-driven heat pumps, which supply the school with space heating, ventilation and domestic hot water supplies. This results in a saving of about 60 percent of the oil that would otherwise have been consumed by a conventional oil-fired heating system. The additional cost of the sunclay system amounted to about 3 percent of the total cost of the school. The Sunclay system was started up in April 1981, and operated well after a number of initial breakdowns. The pay-off time is about nine years, which means that is a 20-year life of the equipment is assumed, together with a 4 percent real rate of interest, the cost of the energy produced is about 30 oere/kWh.

36046 (BFR-R—105-1986) Storage of solar heat for an apartment building at high temperatures in clay. An evaluation. Olsson, S. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 41p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752903/JAW.

The Eksta Housing Foundation has built a number of apartment buildings in Kullavik, having a heating system consisting of roof-integrated solar collectors, a clay heat store, a heat pump and an oil-fired boiler. The objective of the work of this report has been to measure the temperatures and flows in the piping system

and allow evaluation of the performance of both system as a whole and parts of it. Measurements have also been made with the aim of investigating the effects of high temperatures on the clay and on its characteristics. Operating experience after 2.5 years operation is good. No significant breakdowns have occurred, and the system has operated as intended. The energy measurements indicate that the results achieved are largely in accordance with expectations. Oil savings have amounted to 82 percent, as compared to 90 percent as calculated at the time of designing the system. The specific additional investment cost of the solar heating system is SEK 5:40 per kWh of solar energy produced, in terms of price levels as of December 1985. The total specific cost of solar energy, including capital and maintenance costs, is calculated at 46 oere/kWh. The measurements made of the clay indicate that its geotechnical properties have been changed. Future settlement in the body of the clay is feared, although the survival of nearby buildings is not threatened. Thermodynamic characteristics of the clay have been altered only slightly. The observation period has revealed a number of effects that may be worth considering in connection with future use of clay as heat store.

36047 **Alkali metal/halide thermal energy storage systems performance evaluation.** Phillips, W.M.; Stearns, J.W. (Jet Propulsion Lab., California Institute of Technology, Pasadena, CA (US)). *Journal of Solar Energy Engineering;* 109: No. 3, 235-237(Aug 1987).

Materials compatibility and durability of advanced salt/alkali metal slurry thermal energy storage systems has been demonstrated. Applications are being evaluated for both space and terrestrial solar thermal power conversion. High energy density of these thermal storage systems is achieved by colocation of heat input and extraction within the slurry mixture which is overwhelmingly phase-change salt. This paper addresses performance testing of these systems. Understanding of mechanisms of both micro and macro stratification of the slurry is necessary to fully predict system performance as a function of gravity and system geometry. If it can be shown the gravity stratification effects are secondary to a combination of: (1) liquid metal film adhesion (wetting) to the heat exchange surfaces and solidified salt particles, (2) solubility of alkali metal in the salt-rich phase, and (3) stirring produced by liquid to vapor conversion of the alkali metal, then system geometry limitations are greatly relaxed for space application. Performance testing was accomplished using a sodium heat pipe to transfer heat from the slurry canister to a gas gap calorimeter. Testing was accomplished with the heat pipe installed only in the vapor space above the alkali metal/salt slurry and with an increase heat pipe and minimum vapor space. This testing conclusively demonstrated the effectiveness of the pseudo-heat-pipe type heat transfer mechanism operating in the slurry system under terrestrial conditions.

36049 **(HNEI—8009311) Geothermal spas in Hawaii: A new tourist industry?: A preliminary report.** Woodruff, J.L. (Hawaii Univ. at Manoa, Honolulu (USA). Hawaii Natural Energy Inst.). Jul 1987. 65p. Hawaii Natural Energy Institute, University of Hawaii at Manoa, 2540 Dole Street, Honolulu, HI 96822. Order Number TI88009311/JAW.

There are at least three very good uses for active volcanism: Obtain energy from it. Study it. Enjoy it. We are already obtaining electrical energy and industrial heat from Kilauea's abundant resource by drilling geothermal wells and building power plants. Our Volcano Observatory is recognized as a world renowned center of learning about volcanism. Our Volcanoes National Park allows us to view and appreciate this awesome phenomenon. For several years people have speculated about the high potential in Hawaii for another way of enjoying this warmth of mother earth – spas or resorts that would make use of water that is naturally heated and mineralized by volcanic activity. However, before spas are developed in Hawaii, answers are needed to several important questions dealing with such topics as the suitability of our geothermal waters, sources of water that could be tapped, special equipment and materials needed, land availability, governmental and environmental hurdles, and the economics of this unique business. Though a considerable amount of research is still needed, it was felt worthwhile to summarize the information gathered to date from historical works, brochures, personal communications, and other sources. This report should stimulate interest in, and perhaps accelerate, the development of one of Hawaii's most important natural resources.

36050 **Status of the magma energy project.** Dunn, J.C. (Sandia National Labs., Geothermal Research Div., P.O. Box 5800, Albuquerque, NM (US)). pp 3-10 of Geothermal energy symposium. New York, NY; American Society of Mechanical Engineers (1988). (CONF-880104—).

From 11. annual energy-sources technology conference and exhibition; New Orleans, LA, USA (10 Jan 1988).

The current magma energy project is assessing the engineering feasibility of extracting thermal energy directly from crustal magma bodies. The estimated size of the U. S. resource (50,000 to 500,000 quads) suggests a considerable potential impact on future power generation. In a previous seven-year study, the authors concluded that there are no insurmountable barriers that would invalidate the magma energy concept. Several concepts for drilling, energy extraction, and materials survivability were successfully demonstrated in Kilauea Iki lava lake, Hawaii. The present program is addressing the engineering design problems associated with accessing magma bodies and extracting thermal energy for power generation. The normal stages for development of a geothermal resource are being investigated: exploration, drilling and completions, production, and surface power plant design. Current status of the engineering program and future plans are described.

36051 **Geothermal resource assessment in Honduras: How we got to Platanares.** Laughlin, A.W.; Frank, J.; Flores, W. (Los Alamos National Lab., P.O. Box 1663, Los Alamos, NM (US)). pp 65-70 of Geothermal energy symposium. New York, NY; American Society of Mechanical Engineers (1988). (CONF-880104—).

From 11. annual energy-sources technology conference and exhibition; New Orleans, LA, USA (10 Jan 1988).

The initial phase of a geothermal resource assessment of Honduras is essentially complete. Reconnaissance scale geological and geochemical investigations were performed at six previously identified sites to determine relative potentials for electricity generation or direct heat use. Two of the six sites were eliminated because of low potential for the production of electricity and detailed geological and geochemical work was concentrated at the remaining four sites. After an evaluation of new data, two sites (Platanares and San Ignacio) were selected for detailed geophysical surveys and one (Platanares) for gradient drilling. Very encouraging results were obtained from the drilling and it is apparent that a feasibility phase investigation is warranted at Platanares.

36052 **Electricity production in Central America - Geothermal versus other options.** Trocki, L.K.; Hanold, R.J. (Los Alamos National Lab., Los Alamos, NM (US)). pp 71-78 of Geothermal energy symposium. New York, NY; American Society of Mechanical Engineers (1988). (CONF-880104—).

From 11. annual energy-sources technology conference and exhibition; New Orleans, LA, USA (10 Jan 1988).

Electricity demand growth slowed during the economic recession experienced in the early 1980s in Central America but elec-

tricity continues to experience the highest rate of growth in demand among all energy forms. Rapid growth is expected to resume or continue as the region's economies recover from the recession and as the rate of household electrification increases. Large hydroelectric projects have recently been completed in most of the countries. Although overcapacity exists in some countries, most of the national utilities expect to require new capacity within the next five years or earlier. All countries of the region are developing or exploring their geothermal resources. The cost of electricity generated from geothermal energy compares favorably with the cost of the alternatives in Central America. Geothermal energy also has other advantages over the alternatives, which may increase the role played by geothermal energy development by the year 2000. By 2000, at least 10 percent of Central America's electric generating capacity is expected to be geothermal.

1502 Geology And Hydrology Of Geothermal Systems

36053 (LBL—24092) Unstable heat pipes. McGuinness, M.J.; Pruess, K. (Lawrence Berkeley Lab., CA (USA)). Oct 1987. Contract AC03-76SF00098. 6p. (CONF-871111—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010780/JAW.

From 9. New Zealand geothermal workshop; Auckland, New Zealand (4 Nov 1987).

Heat pipes are an important feature of models of vapor-dominated geothermal reservoirs. Numerical experiments reveal that a vapor-dominated heat pipe is unstable if pressure is controlled at shallow levels. This instability is discussed in physical terms, and some implications for geothermal reservoirs are considered. 9 refs., 10 figs.

36054 (LBL—24463) A semi-analytical method for heat sweep calculations in fractured reservoirs. Pruess, K.; Wu, Y.S. (Lawrence Berkeley Lab., CA (USA)). Jan 1988. Contract AC03-76SF00098. 6p. (CONF-880111—5). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008245/JAW.

From 13. workshop on geothermal reservoir engineering; Stanford, CA, USA (19 Jan 1988).

An analytical approximation is developed for purely conductive heat transfer from impermeable blocks of rock to fluids sweeping past the rocks in fractures. The method was incorporated into a multi-phase fluid and heat flow simulator. Comparison with exact analytical solutions and with simulations using a multiple interacting continua approach shows very good accuracy, with no increase in computing time compared to porous medium simulations. 14 refs., 3 figs., 5 tabs.

36055 (LBL—24973) Some effects of non-condensible gas in geothermal reservoirs with steam-water counterflow. McKibbin, R.; Pruess, K. (Lawrence Berkeley Lab., CA (USA)). Jan 1988. Contract AC03-76SF00098. 8p. (CONF-880111—6). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008246/JAW.

From 13. workshop on geothermal reservoir engineering; Stanford, CA, USA (19 Jan 1988).

A mathematical model is developed for fluid and heat flow in two-phase geothermal reservoirs containing non-condensible gas (CO_2). Vertical profiles of temperature, pressures and phase saturations in steady-state conditions are obtained by numerically integrating the coupled ordinary differential equations describing conservation of water, CO_2, and energy. Solutions including binary diffusion effects in the gas phase are generated for cases with net mass throughflow as well as for balanced liquid-vapor counterflow. Calculated examples illustrate some fundamental characteristics of two-phase heat transmission systems with non-condensible gas. 14 refs., 3 figs.

36056 In-situ stress orientation and magnitude at the Fenton geothermal site, New Mexico, determined from wellbore breakouts. Barton, C.A.; Zoback, M.D.; Burns, K.L. (Department of Geophysics, Stanford University, California). *Geophysical Research Letters;* **15**: No. 5, 467-470(May 1988).

The acoustic borehole televiewer provides excellent data for the detection and measurement of stress-induced wellbore breakouts. Analog televiewer data from the Fenton Geothermal well EE-3 in New Mexico were digitized and interactively processed for detection and analysis of azimuth and shape of stress-induced breakouts occurring in the well at depths of about 2.9—3.5 km. A statistical analysis of the measured breakout azimuths yields a well resolved orientation of least horizontal principal stress of 119°, consistent with least principal stress data from the Rio Grande Rift. As the magnitude of the least horizontal compressive stress, S/sub hmin/, in EE-3 is known from hydraulic fracturing, we present a new method in which S/sub hmin/ and data on breakout width are used to estimate the magnitude of the maximum horizontal principal stress. copyright American Geophysical Union 1988

36057 Exploration geothermal gradient drilling, Platanares, Honduras, Central America. Goff, S.; Laughlin, A.W.; Rufenacht, H.D.; Goff, F.; Heiken, G.; Ramos, N. (Los Alamos National Lab., P.O. Box 1663, Los Alamos, NM (US)). pp 55-64 of Geothermal energy symposium. New York, NY; American Society of Mechanical Engineers (1988). (CONF-880104—).

From 11. annual energy-sources technology conference and exhibition; New Orleans, LA, USA (10 Jan 1988).

This paper is a review and summary of the core drilling operations component of the Honduras Geothermal Resource Development Project at the Platanares geothermal prospect in Honduras, Central America. Three intermediate depth (428-679 m) coreholes are the first continuously cores geothermal exploration boreholes in Honduras. These coring operations are part of the Cental America Energy Resource Project (CAERP) effort funded by the Agency for International Development (AID) and implemented by the Los Alamos National Laboratory (Los Alamos) in cooperation with the Empresa Nacional de Energia Electrica (ENEE) and the United States Geological Survey (USGS). This report emphasizes coring operations with reference to the stratigraphy, thermal gradient, and flow test data of the boreholes. The primary objectives of this coring effort were (1) to obtain quantitative information on the temperature distribution as a function of depth, (2) to recover fluids associated with the geothermal reservoir, (3) to recover 75% or better core from the subsurface rock units, and (4) to drill into the subsurface rock as deeply as possible in order to get information on potential reservoir rocks, fracture density, permeabilities, and alteration histories of the rock units beneath the site. The three exploration coreholes drilled to depths of 650, 428 and 679 m, respectively, encountered several hot water entries. Coring operations and associated testing began in mid-October 1986 and were completed at the end of June 1987.

1503 Geothermal Exploration And Exploration Technology

REFER ALSO TO CITATION(S) 36051, 38169

36058 (CRIE-U—87006) Geothermal exploration by geochemical and geophysical methods. Study on the geothermal structure model restricting Shikano hot spring. Kiho, Kenzo; Kusunoki, Ken'ichiro; Suzuki, Koichi; Inoue, Daiei; Miyakawa, Kimio; Kitano, Koichi. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jun 1987. 51p. (In Japanese). NTIS (US Sales Only), PC A04. Order Number DE88770185/JAW.

Evaluation of geothermal resources is important for the geothermal development. Geochemical and geophysical exploration were carried out at Shikano hot spring area, Tottori, Japan, on purpose to verify the efficiency of these exploration methods and a flow model of the spring was proposed. Methods of survey are geological study, soil gas exploration, study on isomers of oxygen and hydrogen, study on 1m depth temperature, MT exploration method which were conducted during April and July of 1986. Hot spring distribution is approximately 1 km in the direction of NNE-SSW, and is of simple salty type with temperature 50 - 85 °C. Mercury can be an index of under-ground temperature as its vapor pressure goes up extraordinarily as the temperature goes up. Zones of low specific resistance reflect the existing condition of under-ground

water. 1 m depth temperature indicates the distribution of narrow range under-ground geo-water. Geo-waters pass through this zone and along the boundary of the Yoshioka and the Tottori granites and extend along the section of NNE-SSE. (33 figs, 6 tabs, 16 refs)

36059 **(ETSU-G—131-P1) Investigations of the UK heat flow field (1984-1987). Investigation of the geothermal potential of the UK.** Gebski, J.S.; Wheildon, J.; Thomas-Betts, J. (British Geological Survey, Keyworth. Geothermal Resources Programme; UKAEA Harwell Lab. Energy Technology Div.). 1987. 84p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ. Order Number TI88102095/JAW.

Between 1984 and 1987, twenty-two new heat flow measurements have been added to the previously reported coverage of around 200 observations. These include observations in two deep boreholes drilled as part of the BGS geothermal exploration programme. Eleven of the sites were specially drilled heat flow boreholes between 100 m and 300 m deep. The remaining observations were made at locations where additional refinement of the heat flow field was warranted. Much of the effort in the present programme has been towards a better definition of the heat flow field associated with the high heat producing granites of the Lake District and Weardale, particularly where the granite extends in the subsurface to the edge of the Tyneside urban conurbation. The apparent high heat flow in the Bowland Forest can no longer be sustained, and the previously reported high heat flows are judged to be enhanced through convective circulation. Some refinements of the heat flow field in the Midland Valley of Scotland and in South Wales have resulted from new observations in these areas.

36060 **(ETSU-G—133-P1) Diagenetic influences on the aquifer properties of the Sherwood Sandstone in the Wessex Basin. Investigation of the geothermal potential of the UK.** Milodowski, A.E.; Strong, G.E.; Wilson, K.S.; Allen, D.J.; Holloway, S.; Bath, A.H. (British Geological Survey, Keyworth. Geothermal Resources Programme; UKAEA Harwell Lab. Energy Technology Div.). 1986. 96p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ. Order Number TI88102094/JAW.

In the Wessex Basin, the Sherwood Sandstone Group is a potential reservoir for geothermal energy. The sandstone is characterized by thin coarse-grained layers with permeabilities of up to 5 or 6 darcys and porosities of about 25 per cent. The occurrence of these zones is a consequence of the initial grain-size of the sandstone and its diagenetic history. Early cementation of significant parts of the sandstone sequence, by carbonates and anhydrite, preserved the rock fabric when it was buried subsequently to greater depths by younger sediments. Of the two cements, the anhydrite was the most significant from the point of view of reservoir properties, for its subsequent dissolution regenerated the original primary porosity and permeability. This was enhanced by the solution of potassium feldspars. The most favourable areas for developing geothermal resources, are south of the Mere Fault and, in particular, in the Dorset Basin between the Cranborne Fault and the Purbeck-Isle of Wight faults.

36061 (NAGRA-NTB—87-15, pp 521-534) **Geothermal conditions in Northern Switzerland.** Rybach, L.; Eugster, W.; Griesser, J.C. (Eidgenoessische Technische Hochschule, Zurich (Switzerland); Basler und Hofmann AG, Zurich (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

The geothermal field in northern Switzerland, derived from a great number of borehole temperature measurements, is characterized by a strongly positive temperature gradient and heat flow anomaly (>150 mWm^2) in the lower Aare valley. The anomaly is centered above the recently discovered Permocarboniferous trough. Several possibilities to explain the anomaly (thermal disturbance in the mantle, cooling shallow intrusion, locally strong uplifterosion, local contrasts in petrophysical properties) can be ruled out on the basis of model calculations. Uprising deep groundwater is favoured as the mechanism creating the observed anomaly. Deep groundwater circulation was investigated in detail, especially to clarify the hydraulic role of the Permocarboniferous trough, by coupled thermo-hydraulic modelling, using the integrated finite difference technique. The model was carefully validated by field data. The results reveal the draining effect of the Permocarboniferous trough and indicate that vertical permeability is present in the vicinity of the trough even at depths of several kilometers. They further imply that large parts of the crystalline basement in northern Switzerland have average hydraulic conductivities $>10^{-9}$ msec and that Darcy velocities in the order of 10 mmyear must be expected. 1506 Environmental Aspects And Waste Disposal

36062 **(ETSU-G—133-P2) Geothermal development - an assessment of the risk of surface subsidence. Investigation of the geothermal potential of the UK.** Williams, A.T. (British Geological Survey, Keyworth. Geothermal Resources Programme; UKAEA Harwell Lab. Energy Technology Div.). 1986. 24p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ. Order Number TI88102093/JAW.

The reduction of pressure in a confined aquifier can cause compaction of the aquifer and the confining layers leading to surface subsidence. It is possible that the development of hot brines in deep aquifers in the UK could cause surface subsidence. The possible causes of subsidence are the compaction of the aquifer material and particularly of the confining layers because of both pressure and temperature changes. It is necessary at the present time to make assumptions about rock properties and operating conditions in a geothermal well before an estimate can be made of the probable magnitude of surface subsidence. Accepting the factors that are most likely to be encountered under operational conditions leads to an estimate of 0.1 m for compaction. It is concluded that more work is necessary to study the problem in detail before any long-term development of geothermal energy could be considered.

1508 Geothermal Power Plants

36063 **(BNL—41162) Decreasing geothermal energy conversion costs with advanced materials.** Kukacka, L.E. (Brookhaven National Lab., Upton, NY (USA)). Mar 1988. Contract AC02-76CH00016. 13p. (CONF-880477—6). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012135/JAW.

From DOE geothermal program review; San Francisco, CA, USA (19 Apr 1988).

If the Geothermal Technology Division (GTD) is to meet its programmatic objectives in hydrothermal fluid production and energy conversion, it is essential that new materials of construction be available. Level III Program Objectives include (1) reducing the costs associated with lost circulation episodes by 30% by 1992, (2) reducing the costs of deep wells and directionally dried wells by 10% by 1992, (3) reducing well-cementing problems for typical hydrothermal wells by 20% by 1991, and (4) the development of a corrosion-resistant and low-fouling heat exchanger tube material costing no more than three times the cost of carbon steel tubes by 1991. The Brookhaven National Laboratory (BNL) materials program is focused on meeting these objectives. Currently, work is in progress on (1) high temperature chemical systems for lost circulation control, (2) advanced high temperature (300°C), lightweight (~ 1.1 g/cc), CO_2-resistant well cementing materials, (3) thermally conductive composites for heat exchanger tubing, and (4) ultra high temperature (600°C) cements for magma wells. In addition, high temperature elastomer technology developed earlier in the program is being transferred for use in the Geothermal Drilling Organization programs on drill pipe protectors, rotating head seals, and blow-out preventors. Recent accomplishments and the current status of work in each subtask are summarized in the paper.

36064 **Performance improvements in binary geothermal power plants using advanced concepts.** Bliem, C.J.; Mines, G.L. (Idaho National Engineering Lab., Idaho Falls, ID (US)). pp 329-334 of Geothermal energy symposium. New York, NY; American Society of Mechanical Engineers (1988). (CONF-880104—).

From 11. annual energy-sources technology conference and exhibition; New Orleans, LA, USA (10 Jan 1988).

The proper choices of a working fluid, component designs, and operating conditions provide improvements in performance in binary geothermal power plants. This study considers pure and mixed hydrocarbon working fluids for binary plants utilizing moderate temperature (450-475 K) hydrothermal resources. The use of halocarbon mixtures is also discussed. For working fluid mixtures, the performance improvement obtained by using a condenser in which the working fluid is condensed in countercurrent flow and with the liquid and vapor phases remaining mixed (integral condensation) is considered. The effect of modification of turbine inlet state points to achieve supersaturated vapor turbine expansions is presented, and the use of a turbine-exhaust recuperator to preheat geofluid using thermal energy from the turbine exhaust is discussed. The Heber plant, a 45 MEWe binary plant built by San Diego Gas & Electric Company in cooperation with EPRI, the US DOE and other utilities, is taken as the baseline binary plant for these investigations. The improvements studied here have not been used in the Heber or other existing binary plants. With these advanced concepts, the performance of a binary geothermal power plant operating with a resource between 450 and 475 K may be improved 25 to 30% over the present state-of-the-art plant as represented by the Heber plant.

1509 Geothermal Engineering

REFER ALSO TO CITATION(S) 36050

36065 **(CRIE-U—86043) Development of rock fracture evaluation technique for hot-dry-rock system. Expansion of fracture estimated from AE measurements made during large-scale hydraulic fracturing test.** Umieda, Hideshi; Sasaki, Shunji. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jun 1987. 36p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752542/JAW.

For heat extraction from a hot dry rock, it is necessary to create an artificial fracture zone in a hot dry rock to provide a geothermal water reservoir. The most promising means for this may be hydraulic fracturing through boreholes provided in the hot dry rock. Recently, large-scale hydraulic fracturing tests at a depth of 3,500 m were carried out by Los Alamos National Laboratory. The rock temperature was about 250°C. In the present study, the acoustic emission (AE) generated from rock fracturing during the tests are analyzed to determine the mechanism of the expansion of fractures within the rock produced by hydraulic fracturing. Results show that most fractures result from shear failure in the rock and that the created fracture zone expands three dimensionally rather than in the form of a single plane. The direction of slip at each fault plan depends on the hydraulic fracturing point. It is suggested that this may be attributed to discontinuity of the rock due to geological variations or existing cracks, rather than to local variations in the direction of stresses within the rock. (18 figs, 5 tabs, 1 photo, 14 refs)

36066 **(LBL—25245) Reducing long-term reservoir performance uncertainty.** Lippmann, M.J. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 6p. (CONF-880477—4; CONF-880477—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010781/JAW.

From DOE geothermal program review; San Francisco, CA, USA (19 Apr 1988).

Reservoir performance is one of the key issues that have to be addressed before going ahead with the development of a geothermal field. In order to select the type and size of the power plant and design other surface installations, it is necessary to know the characteristics of the production wells and of the produced fluids, and to predict the changes over a 10–30 year period. This is not a straightforward task, as in most cases the calculations have to be made on the basis of data collected before significant fluid volumes have been extracted from the reservoir. The paper describes the methodology used in predicting the long-term performance of hydrothermal systems, as well as DOE/GTD-sponsored research aimed at reducing the uncertainties associated with these predictions. 27 refs., 1 fig.

36067 **Development and field performance of a high temperature geothermal turbodrill.** Neudecker, J.W.; Rowley, J.C. (Los Alamos National Lab., Los Alamos, NM (US)). pp 227-232 of Geothermal energy symposium. New York, NY; American Society of Mechanical Engineers (1988). (CONF-880104—).

From 11. annual energy-sources technology conference and exhibition; New Orleans, LA, USA (10 Jan 1988).

The successful completion of a pair of geothermal energy extraction wells in hot granite to depths of over 15,000 feet as part of the Hot Dry Rock Geothermal project at Fenton Hill, New Mexico required the development of special turbodrill downhole motors and high precision directional drilling techniques to drill the highly deviated holes. The turbodrills contained no elastomer seals or bearings and were designed to operate at bottom hole temperatures in excess of 600° with high torque capability in order to drill the granite with tungsten carbide insert (TCI) roller cone bits. The fluid flow and torque characteristics were investigated by laboratory drilling tests in hard granite blocks. Subsequent field directional drilling experience proved the capability of the turbodrills to drill in hot granite at rates of up to 50 ft. per hour. The turbodrills were used in conjunction with bent subs and steering tools to directionally drill both 12-1/4 and 8-3/4 in. diameter holes. The deepest well was drilled to a measured depth of 15,300 ft. with nearly 8500 ft. directionally drilled to a final inclination of 35° from the vertical and to a tightly controlled azimuthal orientation.

36068 **High temperature drilling fluid field experience and analysis.** Aguilar, R.G. (Los Alamos National Lab., Los Alamos, NM (US)). pp 173-178 of Geothermal energy symposium. New York, NY; American Society of Mechanical Engineers (1988). (CONF-880104—).

From 11. annual energy-sources technology conference and exhibition; New Orleans, LA, USA (10 Jan 1988).

The Hot Dry Rock Project has experienced numerous downhole problems while drilling with water and torque reducing agents through hot crystalline granitic rock. Among these problems are high corrosion rates and abrasion, hardware fatigue failures, loss of directional control, numerous fishing jobs, poor mineralogical evaluation and low drilling rates. During recent drilling operations, a modified high temperature drilling fluid was used. The lubricity and corrosion aspects of the fluid were extensively monitored during its use. The performance of the drilling fluid was exceptional. It allowed rapid drilling from 2800 m to 4025 m at an average drill rate of 3.6 m/hr with no downhole failures, good cuttings removal, and easily controlled drag and torque. The only significant drawback was that upon continuous cyclic exposure to elevated temperatures the main component, sepiolite, under-went a phase change to a smectite, causing increased hole drag and torque.

1510 Direct Energy Utilization

REFER ALSO TO CITATION(S) 36051

36069 **The direct application of geothermal energy to provide process heat in Guatemala.** Altseimer, J.H.; Edeskuty, F.J. (Los Alamos National Lab., Los Alamos, NM (US)). pp 49-54 of Geothermal energy symposium. New York, NY; American Society of Mechanical Engineers (1988). (CONF-880104—).

From 11. annual energy-sources technology conference and exhibition; New Orleans, LA, USA (10 Jan 1988).

One part of an energy and resource development program in Central America is a geothermal process heat project in Guatemala. The feasibility of the direct heat application depends upon the production characteristics and reliability of the geothermal source. Other factors are the distance from the heat source, quantity of use, and capacity factor of the use facilities. Favorable conditions would be distances of under 5 km, heat requirements approximately equal

to the well capacity, and high capacity factors (say 60% or higher) in the industrial plants. Depending upon the values of these factors, energy costs of less than $1.00/million Btus to greater than $5.00/million Btus have been estimated. This can be compared to about $5.00/million Btus for petroleum-based fuels in Guatemala in mid 1987. A survey was made of existing industries in the Amatitlan and Zunil geothermal areas. In both Amatitlan and Zunil the existing industries are spread out over an area too large to be called an optimum. The most promising situation for an industrial park development is at Amatitlan, except that proven production wells are not yet available. At Zunil, production wells exist, but a diverse nearby industrial base does not. However, both of these two areas are sufficiently promising to merit further development. Consequently, a demonstration project is underway aimed at the ultimate establishment of an agricultural processing center at Zunil. This center would have the capability to process agricultural products by dehydration, freezing, and cold storage.

16 TIDAL AND WAVE POWER

1607 Tidal Power Plants

36070 **(BFTPRB—111977) Reassessment of Fundy tidal power: reports of the Bay of Fundy Tidal Power Review Board.** (Bay of Fundy Tidal Power Review Board, Nova Scotia (Canada)). Nov 1977. 573p. (CE—01482). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This report presents a feasibility study on cost effective tidal power generation in the Bay of Fundy. The characteristics of various sites in the Bay are examined and possible plant configurations and operating schemes are detailed. Construction and design concepts are discussed and the component parts including generating equipment, are analyzed. Of the tidal power sites which would be capable of producing significant amounts of energy, those at the mouth of Cumberland Basin, Cobequid Bay and Shepody Bay would provide the best prospects for development. The construction of a tidal power plant at any of these sites would be technically feasibile. Under the economic conditions expected to prevail up to and beyond 2000 single basin schemes operated for maximum energy output would offer the lowest unit costs of energy, and would eliminate some fossil-fuelled generation from the Maritime utilities expansion programs. Economic assessment has conclusively demonstrated the fundamental economic feasibility of tidal power and the technical and economic feasibility of its integration into the project generation supply systems of the Maritime Provinces. Because of the large minimum investment, financial feasibility of a tidal power plant would be conditional upon substantial direct participation by governments. The Cumberland Basin site was found to be the preferred candidate project for initial development for many reasons including those deriving from the fact that the project is the smallest of the three projects considered potentially viable. 153 figs., 87 tabs.

36071 **(BFTPRB—111977) Reassessment of Fundy tidal power.** (Bay of Fundy Tidal Power Review Board, Nova Scotia (Canada)). Nov 1977. 57p. (CE—01481). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This report is a summary of a larger report on the feasibility of a tidal power plant in the Bay of Fundy using single-basin schemes with low-head turbines. Three sites out of the many possibilities were selected for intensive study, and their design, construction, and operating conditions are outlined. Since the major objective of the main report was to investigate cost effectiveness of such a project, various aspects of this objective are examined, including power demand expected in the Maritime Provinces, Quebec, and New England, capital costs, comparison with alternative generating schemes, effects of interest rates, inflation and other socioeconomic factors, and environmental concerns. Overall indications point to technical and economic feasibility, with Cumberland Basin being the preferred site. 30 figs., 12 tabs.

1608 Wave Energy Converters

36072 **(CEGB-RM/M/N—1144) Experimental investigation of point absorber arrays.** Count, B.M.; Knott, G. (Central Electricity Generating Board, Southampton (UK). Marchwood Engineering Labs.; UKAEA Harwell Lab. Energy Technology Div.). Nov 1980. 16p. (ETSU-WV—1557-Pt.1). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

Wave energy devices, in a three dimensional description, can have substantial interaction effects which can dramatically improve their absorption characteristics. To validate these predictions a series of experiments were undertaken with arrays of axially symmetric devices, more usually known as point absorbers. A series of vertically oscillating point absorbers were tested with the facilities, to vary device tuning and array geometry conveniently. A theory of 'point absorber' arrays is presented demonstrating that the performance in certain array configurations can be two to three times that achieved by an isolated device. These results refer to an optimised system and are sensitive to device spacing and incident wave direction. Non optimum performance is analysed using numerical hydrodynamic models developed at MEL and these results are compared with a set of experiments carried out for technical Advisory Group 1 of the Wave Energy Steering Committee, at the wide tank at Edinburgh University. The results confirm the theoretical predictions.

36073 **(ETSU-WV—1500-Pt.1) HRS rectifier. Model tests in random waves.** (UKAEA Harwell Lab. Energy Technology Div.; Hydraulics Research Station, Wallingford (UK)). Dec 1979. 36p. (HR-EX—903). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The performance of the model, although a most inefficient design, supported the theoretical predictions of behaviour in monofrequency and random waves. Theory predicts, for a suitably proportioned rectifier, a high performance over a very wide frequency range. From force measurements the most probable maximum forces acting in the lifetime of the structure have been derived. Although sited in a kelp forest the ingress of material would not appear to present a serious problem.

36074 **(ETSU-WV—1500-Pt.2) HRS rectifier. Model tests in mono-frequency waves.** (Hydraulics Research Station, Wallingford (UK); UKAEA Harwell Lab. Energy Technology Div.). Nov 1978. 44p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

Monofrequency wave tests were carried out on four model configurations to examine the response of the rectifier to the various wave parameters and hence find the dimensions for optimum performance. Efficiencies, higher than anticipated, were obtained, the maximum being about 70%, and the range of benefits to be gained by working in relatively shallow water were confirmed. Although the complete optimisation will depend upon the design and construction method employed as well as upon a more precise knowledge of the inshore wave climate, the rectifier is now seen as a structure 30 m wide, 20-25 m high, sitting on the sea-bed in 15 m of water.

36075 **(ETSU-WV—1500-Pt.3) HRS rectifier. Theory and analysis.** (UKAEA Harwell Lab. Energy Technology Div.; Hydraulics Research Station, Wallingford (UK)). Mar 1980. 19p. (HR-EX—921). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The theory presented, shows the Rectifier to have high potential; the maximum efficiency in sine waves is predicted to be 96%. A broad band response resulting from multiple internal reflections of the fundamental and its harmonics gives an efficiency of 80% or greater over a period range of 6s to 14s when sited in 15m of water. Applying the theory to random waves gives a peak efficiency of 81% and an efficiency of 70% or greater over the same period range. The important design factor to emerge was the significance of the harmonics, generated by the intermittent action of

the gates. In order to optimise the performance, the internal geometry of the Rectifier should be kept as simple as possible to allow full development of the various resonances. The effect of inertia in the turbo-generator system is assessed.

36076 **(ETSU-WV—1508-Pt.2) Computer program to calculate the response motion of Cockerell raft wave energy devices.** (UKAEA Harwell Lab. Energy Technology Div.; National Maritime Inst., Feltham (UK)). Aug 1980. 114p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A computer program has been written which calculates the response motions, hinge reaction forces and mean rate of energy extraction of the Cockerell Rafts Wave Energy Device. This report contains a description of the program, a guide for users and some validation of the program.

36077 **(ETSU-WV—1510-Pt.1) Preliminary assessment of the environmental effects of wave energy systems deployed off the Outer Hebrides.** (UKAEA Harwell Lab. Energy Technology Div.; Hydraulics Research Station, Wallingford (UK)). Nov 1977. 43p. (HR-EX—796). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The study had two phases. During the first, HRS assessed the effects of converters situated between 10 and 50 km offshore on the waves, tides and beaches of the chosen study area, which is to the west of the islands of South Uist, Benbecula, and North Uist in the Outer Hebrides. The likely alterations to tides were found to be small, as were the changes for both short period and long period waves. For waves of medium period, however, the wave conditions at the shoreline will be reduced significantly, even for converters located 50 km offshore. Because of less wave activity and less steep waves, there will be a tendency for sandy beaches to accrete. In the second phase of the study, HRS contacted a considerable number of organisations with specialist knowledge in the environmental sciences, navigation etc, and asked their opinions about the effects of the converters in their particular fields of interest.

36078 **(ETSU-WV—1512-Pt.6) Wave power project. Preliminary report on the use of tunnels for power transmission.** (UKAEA Harwell Lab. Energy Technology Div.). Oct 1979. 8p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A brief report is given on a preliminary investigation on the use of tunnels for transmitting power generated offshore by wave energy conversion devices. The tunnels would carry the power cables with a total capacity of 2 GW. After discussing the geology of the area to the west of Uist, some estimates of likely costs and timescale are given.

36079 **(ETSU-WV—1512-Pt.8) Wave enery report on the electrical aspects of the Edinburgh University wave energy device.** (UKAEA Harwell Lab. Energy Technology Div.). Nov 1979. 82p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

An assessment is given of the electrical aspects associated with the wave energy device known as the Edinburgh Duck. Topics covered included synchronous generators and their control equipment, spine cable arrangements, sea to shore transmission and cost estimates. The use of gyroscopes as rotating energy stores is also mentioned.

36080 **(ETSU-WV—1517-Pt.2) United Kingdom wave energy programme. Consultants second report. Vol. 2. Technical appraisal of the devices.** (UKAEA Harwell Lab. Energy Technology Div.; Rendel Palmer and Tritton, London (UK); Society of Local Authority Chief Executives (SOLACE), Northampton (UK)). Aug 1978. 262p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

An assessment is given of the various wave energy devices under development in 1978 in the UK. These include the oscillating water column, Cockerell rafts, Salter ducks and the Flexible Bag. Other topics discussed include the generation and transmission of electricity, the reliability, the annual productivity and the moorings.

36081 **(ETSU-WV—1528-Pt.2) Power conversion systems for ducks.** Salter, S.H. (UKAEA Harwell Lab. Energy Technology Div.). 1987. 22p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

This paper tries to define the problems of power conversion for a wave power device. It presents a little of the background theory; it discusses design principles, existing components and modifications to them; it tries to identify the main practical difficulties. Finally, it describes four possible solutions.

36082 **(ETSU-WV—1538-Pt.1) Development of the L.F.B. wave energy converter 1975-1982.** French, M.J.; Chaplin, R.V. (UKAEA Harwell Lab. Energy Technology Div.). Sep 1982. 90p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

This report describes work done in the Department of Engineering at Lancaster Flexible Bag (LFB) wave energy converter. Most of the work was funded by the Department of Energy but the early stages were supported by the Science Research Council. Chapter 2 gives notes on the various development stages and chapter 3 outlines our current theoretical understanding of attenuators. This theoretical understanding has come relatively recently and the considerably higher powers predicted for devices with phase lead resulting from particular bag stiffnesses are currently being tested in a 1/60 scale rig. In chapter 4, three forms of the device are considered, with decreasing detail: 'the tension leg' version, 'the stiff floater' and the 'series parallel'. The prospects for all of them depend on the theoretical predictions of the benefits of phase lead proving justified in experiments. Given that these benefits were real, the device could be economic.

36083 **(ETSU-WV—1549-Pt.1) Performance tests on a two-stage Wells turbine.** Grant, R.J.; Johnson, C.G. (UKAEA Harwell Lab. Energy Technology Div.). Oct 1980. 13p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

A Wells turbine consisting of a two-stage rotor with inlet/outlet and intermediate guide vanes has been tested in steady flow. The model and test equipment was similar to that used in an earlier series of single stage tests, and the present model was tested at rotational speeds up to 6000 r.p.m. and at flow rates well into the stalled region at lower speeds. The unstalled performance of the model was very similar to what would be obtained by doubling the single stage performance parameters as appropriate, and this suggests that no detrimental interference effects were taking place between the stages. In addition, the decrease in power output as the machine stalled was less abrupt than with the single stage model. Traversing is in hand to investigate this effect and a preliminary result is presented.

36084 **(ETSU-WV—1551-Pt.2) Parametric study of single hinged raft systems.** Count, B.M. (UKAEA Harwell Lab. Energy Technology Div.; Central Electricity Generating Board, Southampton (UK). Marchwood Engineering Labs.). May 1979. 19p. (CEGB-R/M/N—1062). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The work described which has been undertaken under contract for Wave Power Limited, considers the characteristics of a class of wave power devices that consist of two hinged floats. Theoretical methods developed by the author have been used for the study for which the primary objective has been to calculate the power extraction capability and required loading characteristics of these devices. The two major variables considered are the relative size of the two floats and the overall shape of the device. These two parameters are considered separately and simple hinged shallow draught floats of variable relative length are analysed in detail both with and without restraints on the rear section. Hybrid devices in which the front section is deformed into a shorter, deeper structure are analysed only in the case where the rear float is stationary.

36085 **(ETSU-WV—1551-Pt.29) Lancaster Flexible Bag. Design of non-return valves for the Bag cells.** Hancock, M. (UKAEA Harwell Lab. Energy Technology Div.; Wavepower Ltd., Southampton (UK)). Jan 1981. 2p. (WP—128). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The LFB non-return valve comprises 4 frames each of which have 4 hinged flaps giving a $4m^2$ inlet area and $6m^2$ total frame area (shown on WPL drawings W14-11 and W14-12). This arrangement should give excellent sealing which has been identified as a crucial design point. The optimisation of the valve performance and the basis for material selection are outlined. Cast aluminium appears to be the most economical material for flap and frame although work is in progress to confirm this choice.

36086 **(ETSU-WV—1551-Pt.30) Lancaster Flexible Bag. Second report on the design of non-return valves for the Bag cells.** (UKAEA Harwell Lab. Energy Technology Div.; Wavepower Ltd., Southampton (UK)). Oct 1981. vp. (WP—135). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A progress report is given on the design of and the scale model tests of non-return valves for the individual bag cells in the wave energy conversion device known as the Lancaster Flexible Bag. It was concluded that the flaps will close in reverse flows even without closing assistance.

36087 **(ETSU-WV—1551-Pt.34) Lancaster Flexible Bag wave energy device. Auxiliary systems.** Michael, W.R. (UKAEA Harwell Lab. Energy Technology Div.; Y-ARD Ltd., Glasgow (UK)). Aug 1981. vp. (YR—2691/81). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The report presented outlines designs for auxiliary systems required to support power generation on the Lancaster Flexible Bag wave energy device. The work includes an estimate of the cost of supplying and installing these systems. The necessary future work to complete the final design and aspects of the systems requiring detailed attention are described.

36088 **(ETSU-WV—1551-Pt.37) Study of the operation and maintenance costs of the Wavepower Limited Lancaster Flexible Bag system.** Corrie, N.J.B. (UKAEA Harwell Lab. Energy Technology Div.; Easams Ltd., Camberley (UK)). Nov 1981. 80p. (EASAMS—2698). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A maintenance strategy to support the credibility of the Lancaster Flexible Bag wave energy concept, covering scheduled maintenance (servicing and overhaul) and unscheduled maintenance (repair) has been developed and costed. Costs are presented on an annual basis for a turbo-alternator overhaul life of five years (for helicopter and hovercraft maintenance crew transit options) and for a turbo-alternator overhaul life of ten years (hovercraft transit option only). For the case where a turbo-alternator overhaul life of ten years is specified, annual scheduled maintenance costs, including replacements, are Pound 16.15M (0.092 p/kW-h installed); repair and contingency costs are Pound 8.64M (0.050 p/kW-h installed).

36089 **(ETSU-WV—1551-Pt.38) Definition and design of condition monitoring system for the Lancaster Flexible Bag wave energy system.** Megson, N.C. (UKAEA Harwell Lab. Energy Technology Div.; Easams Ltd., Camberley (UK)). Nov 1981. 29p. (EASAMS—2733). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

This study covers the definition and design of a condition monitoring and control system necessary to protect the viability and operation of an array of 250 Lancaster Flexible Bags (LFBs) off the west coast of the Outer Hebrides. The proposed array of LFBs is to collect and transmit a maximum of 2 GW of electrical power to supply the grid system on the Scottish mainland.

36090 **(ETSU-WV—1551-Pt.41) Wave induced bending moments. A prediction method using an advanced mixed sea basin.** Hancock, M. (UKAEA Harwell Lab. Energy Technology Div.; Wavepower Ltd., Southampton (UK)). Jan 1982. 37p. (WP—141). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The Cadnam Mixed Sea Basin generates stable and repeatable mixed seas enabling wave induced bending moments on a floating structure to be accurately determined for a range of sea states. This data is combined with a record of sea state occurrence at the intended location in a probabilistic analysis which yields the distribution of bending moments over any desired period of operation.

36091 **(ETSU-WV—1551-Pt.48) Computer simulation of the Lancaster Flexible Bag. Description of method, program code and operation.** (UKAEA Harwell Lab. Energy Technology Div.; Wavepower Ltd., Southampton (UK)). Sep 1982. 34p. (WP—145). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A brief report and print-out of the computer program used are given for the computer simulation of the wave energy device known as a Lancaster Flexible Bag. The development of the theory and the equations used are presented and the numerical method and solution of the equations outlined.

36092 **(ETSU-WV—1551-Pt.49) Markov model of air power.** (UKAEA Harwell Lab. Energy Technology Div.). Sep 1982. 4p. (WP—148). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

Statistical models are being developed to predict power surges over a typical range of sea states for wave energy converters in which air enclosed by a flexible element is pumped through a turbine by wave pressure. The success of Markov simulations is discussed. Present Markov models can predict surges accurately where they occur in high energy cases, but not in low energy cases.

36093 **(ETSU-WV—1551-Pt.52) Experimental investigation of the loads on a 2 dimensional model of a bottom standing LFB design.** (UKAEA Harwell Lab. Energy Technology Div.; Wavepower Ltd., Southampton (UK)). Sep 1982. 24p. (WP—150). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A brief report is given of wave tank tests of the wave energy conversion device known as the Lancaster Flexible Bag. The tests under both normal and extreme sea states are to provide structural strength information for devices mounted on the sea bed. With the two-dimensional model used, it is concluded that the main determinant of structural load is wave height.

36094 **(ETSU-WV—1551-Pt.53) Tube mooring and spring development programme.** (UKAEA Harwell Lab. Energy Technology Div.; Wavepower Ltd., Southampton (UK)). Sep 1982. 35p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

A report is given on the development programme on tube moorings and high pressure seawater pumps for the Bristol cylinder wave energy device. Applications to the Lancaster Flexible Bag are also discussed. The theoretical calculations are compared with scale model tests with tube bores up to 100 mm diameter and these provide confirmation of the theory. Fatigue characteristics are also studied for the tube material.

36095 **(ETSU-WV—1551-Pt.55) Reliability assessment and its application to the wave energy programme.** (UKAEA Harwell Lab. Energy Technology Div.; Wavepower Ltd., Southampton (UK)). Sep 1982. 19p. (WP—154). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

Two significant factors in wave energy economics are the system availability and the costs of repairs, both of which are sensitive to the reliability of the components involved. The question to be considered here is whether a reliability assessment made at the design stage is acceptable as a tool for making judgements regard-

ing the economic viability of a wave energy system or for making comparisons between alternative systems. A particular aspect of this question is whether the approach to reliability assessment adopted for the current programme is appropriate for predicting the reliability to be expected at the conclusion of the development cycle.

36096 **(ETSU-WV—1551-Pt.57) Comparative tests between a manifolded air system and linear and quadratic damping applied to a single air cell of the Lancaster Flexible Bag.** (UKAEA Harwell Lab. Energy Technology Div.; Wavepower Ltd., Southampton (UK)). Sep 1982. 38p. (WP—151). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

Work by both Wavepower Limited and SEA has shown that an economic route to wave energy conversion may be obtained through a device with a closed power air circuit which is fed by a number of air filled flexible membranes whose motion is governed by the incident sea waves. Comparison of wide tank test results of the Clam and LFB showed that the former produced significantly more power, although a similar device in terms of overall dimensions. The most likely explanation of this difference was considered to be the difference in the air power conversion system. To investigate further into the differences between these two power take off systems, the models were reduced to a simplified two dimensional test rig, making it possible to measure both bag and power characteristics in isolation from the effects of spine dynamics.

36097 **(ETSU-WV—1551-Pt.58) Summary of model test programme conducted by Wavepower Limited on the Lancaster Flexible Bag.** (UKAEA Harwell Lab. Energy Technology Div.; Wavepower Ltd., Southampton (UK)). Sep 1982. 6p. (WP—157). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A summary is given of wave tank tests on models of the Lancaster Flexible Bag wave energy converter. The total power output was measured for various sea states including mixed seas. The model scale was 1:75.

36098 **(ETSU-WV—1581-Pt.11) Wave energy devices - a reliability study of the power generating plant in a 360MW Bristol Cylinder device array.** James, R.E. (UKAEA Harwell Lab. Energy Technology Div.; Y-ARD Ltd., Glasgow (UK)). Mar 1982. 78p. (YR—2730/81). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The failure characteristics and potential corrective maintenance strategies of the power plant for a 360MW device array are studied. The major conclusion is that, with the design in its present form, a very large number of very small effect failures could result in a persistent power loss of sizeable proportion unless responded to without undue delay. It recommends that a strategy for dealing with them plus an alternative means of rectification should be developed to permit cost effective repair of these small effect failures. It also highlights aspects within the design which might result in unsafe consequences, with respect to plant or maintenance personnel, and recommends a deeper consideration of them by the design team.

36099 **(ETSU-WV—1587-Pt.1) Implications for fisheries of siting wave energy converters in the Moray Firth.** Lampitt, R.S. (UKAEA Harwell Lab. Energy Technology Div.). 1987. 102p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

A report is given which assesses the effect of siting a string of wave energy converters (WEC's) across the mouth of the Moray Firth with particular reference to the fishing industry. The first four sections provide background information on the marine environment, the biology of the major fish species and the state of the commercial fishery. In section V the effect of WEC's on the fishery are discussed. Such an effect may be 1) by an environmental change; 2) by a direct effect on fish; 3) by loss of access to fishing grounds; or 4) by loss of free passage to fishing grounds.

36100 **(ETSU-WV—1612-Pt.1) Review of current methods for analysing the characteristics of mooring systems with particular reference to non-linear response and extreme mooring forces. Part 1. Analytical methods.** Chan, H. (UKAEA Harwell Lab. Energy Technology Div.). Mar 1980. 45p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A review is given of the current methods available to analyze the characteristics of mooring systems for all types of floating wave energy devices. Particular attention is paid to the estimation of non-linear responses and extreme mooring forces. A collection of recently developed computer programs is given.

36101 **(ETSU-WV—1614-Pt.1) Appraisal of mass production costs for wave energy devices.** (UKAEA Harwell Lab. Energy Technology Div.; P-E Consulting Services Ltd., Egham (UK)). Mar 1980. 40p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

A report is given on a study undertaken by a UK consultant group on the possible costs for wave energy devices based on mass production. Three devices are considered: Cockerell Raft, Lancaster Flexible Bag and the Salter Duck. Some concepts are proposed for the approach to manufacture which need to be adopted if wave energy devices are to be produced at the lowest cost.

36102 **(ETSU-WV—1628-Pt.1) Study on the assessment of costs for installing and maintaining mooring systems for wave energy devices.** (UKAEA Harwell Lab. Energy Technology Div.). Sep 1980. 238p. (SO—4923). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

The results of a theoretical study to assess the costs of installing and maintaining mooring systems for floating wave energy devices proposed to be placed, in 60m of water, west of the Hebrides are presented. The hypothetical device considered is kept on station by 'mooring systems' developed during the study and designed to withstand a highly compliant system with relatively low forces, a highly restrained system with consequential high forces, and an intermediate system. Based on the limited design criteria submitted, the scope of work includes conceptual design of practical mooring systems and selection of a preferred solution for each of the three conditions. For each of these solutions the installation procedure and resource requirements have been developed, as were the total maintenance requirements expected over the design life of thirty years. Finally, budget cost estimates on the hardware, installation and maintenance for each system per device have been developed.

36103 **(ETSU-WV—1632-Pt.1) Energy analysis in the assessment of the U.K. wave energy programme, 1978.** Harrison, R.; Jenkins, G.; Mortimer, N.D. (UKAEA Harwell Lab. Energy Technology Div.). Jun 1980. 88p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

Energy workshop report no. 18.

It is argued that by using energy analysis, the energy element in the costs for wave energy systems and the inflationary effects of price rises can be directly determined. The energy input to energy output ratios are evaluated for five wave energy devices. Only one has a value of less than unity and hence satisfies the basic criteria of energetic viability. It is argued that these results raise serious questions about the rationality on continuing with major funding of the UK wave energy programme.

36104 **(ETSU-WV—1637-Pt.1) Quasi-static analysis of wave loadings on spine-based wave energy devices.** Lockett, F.P.; Peatfield, A.M.; West, M.J. (UKAEA Harwell Lab. Energy Technology Div.). Feb 1980. 41p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A report is given on the Wave Energy Research Programme at Lanchester Polytechnic. Results are presented for both theoretical and experimental scale models for wave loadings on circular and rectangular spines of various lengths. The results are in good

agreement over the operational wave range for the 1/50 scale model and for the more limited data on the 1/10 scale model.

36105 (ETSU-WV—1649-Pt.1) Operation, control and monitoring of a 2GW wave energy scheme. Summary. Buchanan, G.; Jordan, J.R.; Whittington, H.W. (UKAEA Harwell Lab. Energy Technology Div.). May 1982. 13p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

A report is given on the design of a control system to be used in conjuction with a 2 GW offshore wave energy device. The system control is performed by a shore based computer which is the link between the grid and the wave energy station. The data flow between the main computer and the sea based computers sited on the wave energy devices is described. Recommendations are made on control, data collection, telemetry and data acquisition.

36106 (ETSU-WV—1666-Pt.1) Validation and interpretation of directional wave observations with the Marex buoy. Final report. McCartney, B.S. (UKAEA Harwell Lab. Energy Technology Div.). Feb 1984. 17p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ.

This contract funded NERC (IOS) to assess the technical performance of a new directional wave buoy (S100) produced by Marex, and to interpret directional data obtained at its proposed location west of South Uist. Early intercomparisons at Freshwater Bay, I.O.W., indicated inadequacies in the buoy slope response. Modifications were made for the South Uist moorings. Faults in the Marex buoy compass signals prevented a successful intercomparison with the IOS pitch-roll buoy at South Uist. A thorough one-dimensional (heave) intercomparison between the Marex buoy and an IOS Datawell Waverider at the South Uist site was made over a 2 month period. In view of the lateness for W.E.S.C. purposes, UKAEA terminated the Marex contract prematurely and consequently this NERC contract. In view of the almost developed state of the Marex buoy, and since this buoy has good potential as a medium capability directional wave buoy between the Datawell Wavec and the EMI DB2 types, recommendations for its repair, completion and further critical evaluation are made.

36107 (GEC-ESL/R—81-85) Feasibility study on the design and operation of turbo-generating equipment for the Lancaster Flexible Bag wave energy converter. Vol. 1. Johnston, J.; Topham, H.G.; Mahadevan, D.M. (GEC Energy Systems Ltd., Leicester (UK); UKAEA Harwell Lab. Energy Technology Div.). Feb 1982. 152p. (ETSU-WV—1551-Pt.42). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

Report commissioned by Wave power Ltd., Southampton (GB).

This report commissioned by Wavepower Ltd covers the performance, material selection, aerodynamic design, stress analysis, layout, control and costing of the turbine, generator, exciter, auxiliary generator and essential auxiliary equipment for 500 Lancaster Flexible Bags. The aims were to combine as far as possible, high efficiency, the correct damping for the bags, a high integrity design suitable for a 25 year life, 10 years between bearing replacement and overhaul, minimum space, and minimum cost per turbine-generator unit. The control system optimizes flexible bag performance, and turbo-generator performance in low seas and limits power in high seas without introducing unnecessary kinetic losses within the closed circuit circuit system. Various methods of control are discussed and computer simulations are reported in full. The report includes sections on overhaul and maintenance condition monitoring, reliability, safe stress levels in a corrosive atmosphere, bearing life calculation, and proposals for future work.

36108 (NEL-ENER—14) Fatigue of 40 mm diameter six-strand wire rope in a seawater environment. (National Engineering Lab., East Kilbride (UK); UKAEA Harwell Lab. Energy Technology Div.). Mar 1984. 8p. (ETSU-WV—1579-Pt.1). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

Rope samples were tested in two conditions, as received and pre-corroded in flowing seawater. There was no noticeable difference in endurance between the two conditions at the testing frequency of 4Hz. Four mean load levels were used and only at the longer endurances was there any detectable difference in endurance. Tests carried out at 0.16 Hz showed no significant difference in endurance from the 4 Hz tests. Correlation between this series of tests and fatigue tests on single wires, conducted by AERE Harwell, is inconclusive.

36109 (NEL-ENER—27) Cyclic testing of continuously wetted synthetic fibre ropes. (National Engineering Lab., East Kilbride (UK); UKAEA Harwell Lab. Energy Technology Div.). May 1983. 133p. (ETSU-WV—1664-Pt.1). British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

A laboratory study of the cyclic loading endurance properties of continuously wetted synthetic or man-made fibre ropes has been conducted as a guide to their suitability on mooring systems for wave energy recovery devices. The materials investigated were polyamides, polyester and polypropylene. Forms of construction studied were braid-on-braid, eight strand (square) and parallel lay. Rope sizes researched were 100 kN (10 tonf) nominal breaking force and up to 1.0 MN (100 tonf) nominal breaking force. All specimens were single leg. The test results indicate the superior bollard abrasion resistance and interstrand friction wear resistance of polyester and polypropylene over the polyamides. Trends, where observed, are also reported upon for the cyclic endurance performance of the forms of construction investigated. The improvements (or otherwise) in endurance effected by sheathing, coating and thimble protection of the eyes are also discussed.

36110 (STEV-NYEL—88-2) Computer assisted wave predictions based on the wave measurements by SMHI along the Swedish coast. Program description with examples. Soederberg, P. (SSPA Maritime Consulting AB, Goeteborg (Sweden); Statens Energiverk, Stockholm (Sweden)). Dec 1987. 72p. (In Swedish). (SSPA—8306-2). NTIS (US Sales Only), PC A04. Order Number DE88752962/JAW.

In this report a newly developed computer program called VAGPRED is presented. This program is working by interactive commands processing a search through the complete database. The wave conditions, including the wave spectral shape, can be predicted based on input of wind direction and speed. The expected variation up to four hours after the observation is also predicted. By running the program, (one example is included in this report), it has been shown that for a developed wave condition, when the combination of wind and waves is stable, no significant change is to be expected within a time period of four hours. If, however, the wave height is reduced, for instance by a wave energy absorber, in this example by 15%, it will take in the region of one or two hours to rebuild the wave amplitude.

(Institutt for Kontinentalundersoekelser og Petroleumsteknologi A/S, Trondheim (Norway). Oseanografisk Senter). May 1985. 13p. (CONF-8505286—2). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752840/JAW.

From 10. ARGUS conference; Kiel, F.R. Germany (22 May 1985).

A new wave direction buoy developed during 1983-84 is presented. The new design is built on IKUs experience with wave direction buoys over the last five years. A detailed presentation of the on-board data acquisition and processing system is given. Different methods for utilising the limited capacity af ARGOS are also discussed. Some results from the field tests are presented. 7 drawings.

36112 (DOE/NASA/20320—75) Comparison of pressure distributions on model and full-scale NACA 64-621 airfoils with ailerons for wind turbine application. Gregorek, G.M.; Kuniega, R.J.; Nyland, T.W. (Ohio State Univ., Columbus (USA); National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). Apr 1988. Contract AI01-76ET20320. 12p. (NASA-TM—100802). NTIS, PC A03;3. Order Number DE88009618/JAW.

The aerodynamic similarity between a small (4-in. chord) wind tunnel model and a full-scale wind turbine blade (24-ft tip section with a 36-in. chord) was evaluated by comparing selected pressure distributions around the geometrically similar cross sections. The airfoils were NACA 64-621 sections, including trailing-edge ailerons with a width equal to 38 percent of the airfoil chord. The model airfoil was tested in the OSU 6- by 12-In. High Reynolds Number Wind Tunnel; the full-scale blade section was tested in the NASA Langley Research Center 30- by 60-Ft Subsonic Wind Tunnel. The model airfoil contained 61 pressure taps connected by embedded tubes to pressure transducers. A belt containing 29 pressure taps was fixed to the full-scale section at midspan to obtain surface pressure data. Lift coefficients were obtained by integrating pressures, and corrections were made for the three-dimensional effects of blade twist and downwash in the blade tip section. Good correlation was obtained between the results of the two different experimental methods for angles of attack from -4{degree} to 36{degree} and aileron deflections from 0{degree} to 90{degree}. 4 refs., 11 figs., 1 tab.

36113 (EPRI-AP—5824) Altamont wind power plant evaluation for 1986: Final report. Smith, D.R.; Ilyin, M.A. (Pacific Gas and Electric Co., San Ramon, CA (USA)). May 1988. 85p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010643/JAW.

Pacific Gas and Electric Company (PG&E) purchases electric energy from the wind turbines in Altamont Pass, which has more wind driven electric generators than any other place in the world. The Electric Power Research Institute (EPRI) has sponsored a project to examine the technology and performances of these turbines, and their effects on the utility grid. This report gives some results from monitoring the wind resource. Trends in turbine design are presented. The performance of the wind farms in 1986 is analyzed, with an attempt to estimate the effects on energy production of turbine technical problems and a lower than expected wind resource in many areas. Also considered is the fit of the wind to utility need. Hour by hour data on wind farm output and PG&E area loads were compared, and loss of load probability (LOLP) computations were made to find the capacity credit or load carrying capabilities (LCC) of the wind farms. Some considerations is given to the problems, such as poor power factor, that the utility experience due to wind farm operation. Also the cost of wind energy is estimated.

36114 (HNEI—88-01) Baseline interface data from a wind turbine array intertied to a utility: Phase 1 report. Neill, D.R.; Huang, H.; Holst, B. (Hawaii Univ. at Manoa, Honolulu (USA). Hawaii Natural Energy Inst.). Mar 1988. Contract AC02-83CH10093. 106p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88009309/JAW.

The objective of this project is to obtain baseline physical, electrical and performance data which characterizes: (1) a wind turbine array interconnected with a utility at the point of interconnection, (2) the utility power generation and distribution system up to the point of array interconnection, and (3) the interaction between the two systems. This characterization included static as well as dynamic behavior. The chacterization study is for the Big Island of Hawaii and its utility system, the Hawaii Electric Light Company. The results are presented here.

36115 (NEI-DK—58) Report on adaption of heat pump to wind mill. Vestergaard, K.; Lund, V.; Pallesen, H.; Rasmussen, P. (Nordtherm, Nibe (Denmark); Miri Staal og Maskinvaerksted ApS, Brovst (Denmark); Produktudviklingscentret, Loegstoer (Denmark); Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark)). Jul 1987. 49p. (In Danish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752833/JAW.

The present project investigates the possibilities of adding a heat pump to a small electric power generating wind turbine. The heat pump is detached mechanically to the existing system and is thus using the wind turbine as a mechanic driving station. This construction avoids loss of power in transmission and conversion at up to 30% of the total power and small turbines (<10KW) have the greatest loss. These losses can be used in the heat pump by a direct detachment of turbine and heat pump. This preliminary investigation shows that as a purely heat producing turbine it is profitable, provided the energy source is available and the need is present. (SM).

36116 (RISO-M—2510) Wind energy applications for rural areas. Kocsis, K.; Petersen, H. (eds.). (Risoe National Lab., Roskilde (Denmark)). May 1987. 273p. (CONF-8705276—). NTIS (US Sales Only), PC A12/MF A01. Order Number DE88752922/JAW.

From Workshop of the European cooperative networks on rural energy on wind energy applications for rural areas; Roskilde, Denmark (14 May 1987).

The proceedings contain in the introduction a brief description of the FAO organization CNRE, European Cooperative Networks on Rural Energy, of which the work on wind energy application for rural areas is one of the activities. This description is followed by a summary of the workshop "Wind Energy Applications for Rural Area", held 14-16 May 1986 at Risoe National Laboratory, with brief reports on the papers and on the concluding session enumerating proposals agreed upon by the participants for future work. The papers of the workshop are reproduced mainly as delivered by the authors.

36117 (RISO-M—2601) Wind turbine test Bonus 95 kW. Schmidt Paulsen, U. (Risoe National Lab., Roskilde (Denmark)). Mar 1987. 59p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752924/JAW.

The report describes standard measurements performed on a Bonus 95 kW wind turbine. The measurements carried out and reported cover information on power output, system efficiency, energy production efficiency of air brakes, structural dynamics, loads at cut-in and braking, and noise emission. (editor).

36118 (SAND—87-2461) Modal testing in the design evaluation of wind turbines. Lauffer, J.P.; Carne, T.G.; Ashwill, T.D. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1988. Contract AC04-76DP00789. 25p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010374/JAW.

This report reviews several techniques of low-frequency excitation used successfully to measure modal parameters for wind turbines, including impact, wind, step-relaxation, and human input. As one application of these techniques, a prototype turbine was tested and two modal frequencies were found to be close to integral multiples of the operating speed, which caused a resonant condition. The design was modified to shift these frequencies, and the turbine was retested to confirm expected changes in modal frequencies.

36119 (SAND—88-0152) Three-dimensional wind simulation. Veers, P.S. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1988. Contract AC04-76DP00789. 40p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009793/JAW.

A method for numerically simulating a three-dimensional field of turbulent windspeed (the "Sandia method") for use in the aerodynamic and structural analyses of wind turbines is presented. The required inputs are single point power spectral densities (PSDs) and the coherence function. Suggestions for appropriate

inputs and an example calculation are included. The simulation method is used to obtain "rotationally sampled" PSDs, which are compared with measurements obtained by Pacific Northwest Laboratories. The results show that the Sandia method is capable of producing simulations that agree with the measurements, especially when the coherence function is augmented from the usual form to include the ratio of spatial separation over height raised to the 0.25 power. The method is specialized for horizontal axis wind turbine analysis by phase lagging the simulations at each point in space so that wind speeds are simulated only when the turbine blade passes the point, reducing storage requirements and computation time by about an order of magnitude. For vertical axis applications, where interpolation will be required, the error induced by the interpolation is estimated and eliminated by the addition of white noise. 16 refs., 10 figs., 1 tab.

36120 (SAND—88-1360C) Liquid crystals for unsteady surface shear stress visualization. Reda, D.C. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 15p. (CONF-880716—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010570/JAW.

From 1. national fluid dynamics congress; Cincinnati, OH, USA (24 Jul 1988).

Oscillating airfoil experiments were conducted to test the frequency response of thermochromic liquid crystal coatings to unsteady surface shear stresses under isothermal-flow conditions. The model was an NACA-0015 airfoil, exposed to an incompressible flow at a freestream Reynolds number (based on chord) of 1.14 x 10^6. Angle-of-attack forcing functions were sine waves of amplitude +- 10{degree} about each of three mean angles of attack: 0{degree}, 10{degree}, and 20{degree}. Frequencies of oscillation were 0.2, 0.6 and 1.2 hertz, corresponding to reduced frequencies of 0.0055, 0.0164 and 0.0328. Data acquisition was accomplished by video recording. Observations showed the liquid crystal technique capable of visualizing high surface shear stress zones over the stated dynamic range in a continuous and reversible manner. 11 refs.

36121 (STEV-VIND—87-19) Description of the computer program for the wind power station at Hoenoe. Landqvist, B. (Statens Energiverk, Stockholm (Sweden); Foersvarets Forskningsanstalt, Stockholm (Sweden)). Mar 1987. 318p. (In Swedish). (FOA-C—20651-2.7). NTIS (US Sales Only), PC A14. Order Number DE88752855/JAW.

The report describes the total program for the computer at Hoenoe wind power station. Two versions are described, one for constant speed and the other for variable speed in a wide range. The control and supervisory parts are presented in detail, while remaining parts are described in a more superficial manner. The report treats also a model of the wind power station for simulation in an analog computer.

36122 (STEV-VIND—87-22) Calculation of the forces on the CTH windmill at Hoenoe prior to tests with yaw-control. Nygren, I. (Statens Energiverk, Stockholm (Sweden)). May 1987. 18p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752856/JAW.

Calculation of the forces in the primary shaft and on the blade joint with yaw-control on a 40 kW windmill.

36123 (STEV-VIND—87-23) Hoenoe testing station. Synchronous generator with frequency convertor for operation of windmill with variable speed. Carlsson, O. (Statens Energiverk, Stockholm (Sweden)). May 1987. 99p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752857/JAW.

This paper describes a variable speed ac-drive system, which consists of a synchronous generator with frequency convertor. This system allows a wide rage of turbine speed variation but the electrical machine can only work in generator mode. The electrical torque is fully controlled over the entire speed range. Results obtained with transient state calculations using computer models and laboratory tests were performed for the electrical system. Results from operating the test windmill have been carried out.

36124 (STEV-VIND—87-24) Investigation of a synchronous generator with a frequency converter for operation with variable speed at Hoenoe test station for wind energy research. Johansson, G. (Statens Energiverk, Stockholm (Sweden)). Jul 1987. 72p. (In Swedish). NTIS (US Sales Only), PC A04. Order Number DE88752858/JAW.

This paper describes the measurements and presents test results for variable speed operation of an electrical system consisting of a synchronous generator and a frequency convertor. The tests and measurements have been carried out both in the laboratory and on a windmill. At windspeeds lower than rated the turbine is operated at optimal speed and at higher windspeeds the power pitch-controled.

36125 Sandia National Laboratories 34-meter diameter vertical axis wind turbine test bed aerodynamic performance. Klimas, P.C.; Berg, D.E.; Stephenson, W.A. (Wind Energy Research Div., Sandia National Labs., Albuquerque, NM (US)). pp 85-86 of Seventh ASME wind energy symposium. Swift, A.H.P.; Thresher, R.W. New York, NY; American Society of Mechanical Engineers (1988). (CONF-880104—). Contract AC04-76DP00789.

From 11. annual energy-sources technology conference and exhibition; New Orleans, LA, USA (10 Jan 1988).

Sandia National Laboratories (SNL) is completing erection of its 34-meter diameter vertical axis wind turbine (VAWT) Test Bed near Amarillo, Texas. This versatile VAWT, rated at 500 kW in a 12.5 m/s (28 mile per hour) wind, has been designed to demonstrate aerodynamic, structural dynamic, and control strategies intended to improve the effectiveness of VAWT systems. The Test Bed rotor features blades of two distinct airfoil sections, one of which was designed specifically for the VAWT environment, and three separate chord length. The motivation for this configuration came from the need to provide positive aerodynamic stall regulation, high power coefficients in low and moderate winds, and modest material stress level. The curved equatorial portion features the SAND 0018/50 laminar flow (NLF) profile with a 91 cm (36 in) chord. This 18 percent hick symmetrical section was developed by SNL and G. Gregorek, Ohio State University. Its low drag at small angles-of-attack and sharp stall should contribute to high rotor power coefficients in modest winds and provide excellent stall regulation. The curved 7.6 m (25 ft.) lengths which adjoin the equatorial portion use a slightly modified version of this section with a 107 cm (42 in) chord. The modification gives the section a relatively sharper trailing edge and is dictated by the aluminum extrusion process used to fabricate the blades. The Reynolds number (based on blade chord) range for these sections is 1-4 million. The 10.7 m (35 ft) long, straight portions which join the blade to the central column use the NACA 0021 profile and have a 122 cm (48 in) chord. This profile was chosen for its gradual and gentle stall characteristics, as these blade elements operate over the widest range of angle-of-attack.

36126 (CONF-880403—1) Cofiring of pelletized refuse-derived fuel with coal to achieve sulfur dioxide emissions requirements. Ohlsson, O.O.; Pearson, C.V.; Lazar, J. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012035/JAW.

From American power conference; Chicago, IL, USA (25 Apr 1988).

Processing of municipal solid waste with lime additives has produced a high quality, storable, fuel pellet. Earlier studies of the beneficial effect of lime addition to coal and of the cofiring of lime-rich refuse-derived fuel pellets with coal suggested cofiring these pellets with Illinois or Kentucky coals in order to reduce sulfur dioxide emissions. A series of burn tests were conducted at Argonne

National Laboratory in the summer of 1987 to verify the rate and conditions for optimum sulfur capture. Pellets with lime additions of 4-8% (by weight) were fired at 10, 20, or 30% (by ratio of heat input) with coal. This paper presents the results to date.

36127 (CONF-880699—5) **Studies on the use of propylene carbonate as a high-voltage insulator.** Clark, R.S.; Green, D.L.; Buttram, M.T.; Lawson, R.; Rohwein, G.J. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 15p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011786/JAW.

From 18. power modulator symposium; Hilton Head, SC, USA (20 Jun 1988).

A research program has been initiated to determine if propylene carbonate can be used as an insulator in the high-voltage accelerator field. Propylene carbonate, an industrial solvent and plasticizer, is a relatively high-dielectric constant (69) liquid with a low surface tension coefficient. The high-dielectric constant is attractive, because it leads to more compact pulse-forming lines (PFL) and the low surface tension lends itself to electrical component impregnation. Electrical properties, such as dielectric strength, resistivity, frequency response, and surface tracking, have been investigated. Initial tests show that propylene carbonate can be deionized to several MOmega-cm and that the electric field strength of plastic laminates immersed in it is several times higher than laminates immersed in oil. These tests reveal that a materials compatibility problem exists but it will not be so sever as to limit propylene carbonate usage in this field. These tests will determine if propylene carbonate can be used in advanced pulsed power systems to produce higher energy densities than are available with today's technology. Higher laminate field strengths will be especially advantageous in the design of high-voltage transformers. If the high-frequency response is sufficient, it may be possible to design magnetically switched pulse-forming lines with the switches in the same insulating fluid as the pulse-forming lines and thereby eliminate the oil-water barrier (interface) which is troublesome in present accelerators. The results of this investigative program will be presented.

36128 (CRIE-T—86087) **Basic design of load conditioner.** Ishikawa, Rikio; Iwahori, Tooru; Yokota, Tsutomu. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Aug 1987. 44p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752536/JAW.

The load leveling measures of power demand is important for reducing the supply cost by effectively utilizing the power source equipment. Meanwhile, the development of new service on the demand side is also important for increasing the demand. It is expected to immediately develop the load conditioner, a low-cost small capacity of power storage system, by which the household stores the low-priced mid-night power in the battery and it consumes the power from the battery in the daytime. The basic components, specifications and problems of the lead-acid battery type load conditioner which can be installed in any households are presented. The main components include the charging rectifier, discharging self-excited inverter and battery. The specifications are as follows: the capacity is 2 to 8 kWh; the maximum output is 2 to 3 kW; I/O is of single phase, 100 V and 50 (60) Hz; and the target efficiency is 70% or more. The cost reduction of the AC-DC power inverter and lead-acid battery is indispensable for spreading the load conditioner. (15 figs, 8 tabs, 20 refs)

36129 (EPRI-AP—5702, pp 1.1-1.9) **Improving gas turbine reliability and availability.** Dolbec, A.C. (Electric Power Research Institute, Palo Alto, CA (USA)). Mar 1988. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920242/JAW.

In Gas turbine procurement: 1987 workshop: Final report.

A discussion of the improvement of gas turbine reliability and availability is presented in outline form. Topics discussed include the characteristics of utility gas turbine procurement, EPRI's gas turbine reliability program and goals, how reliability can be specified, and gas turbine reliability in the 1990's.

36130 (EPRI-AP—5702, pp 2.1-2.22) **EPRI's project to develop guidelines for procuring high availability utility gas turbine systems.** Wills, R.E. Jr. (Creole Production Services, Inc., Houston, TX (USA)). Mar 1988. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920242/JAW.

In Gas turbine procurement: 1987 workshop: Final report.

A guide for the procurement of high reliability gas turbine systems is presented. Information is presented on the scope of work, efforts to date, gas turbine exhaust thermocouples, gas turbine control instrumentation problems, gas turbine exhaust/duct work, and HRSG accessibility concerns.

36131 (EPRI-AP—5702, pp 3.1-3.9) **Customizing combustion turbine power plants to meet utility needs.** Moyers, E.K.; Sudduth, A.L. (Duke Power Co. (USA)). Mar 1988. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920242/JAW.

In Gas turbine procurement: 1987 workshop: Final report.

Duke Power Company serves an area of 20,000 square miles with a population of 4,400,000. Its generating capacity of 15,855 MW is derived primarily from three nuclear stations and eight coal-fired stations, which provide base and intermediate load capacity. Peak load power is normally provided by 25 conventional hydroelectric stations and the 610 MW Jocassee pumped storage station. Duke currently has 599 MW of combustion turbine capacity. This capacity consists of aircraft derivative and small frame (i.e., GE Frame 5 and W 251 & 301) engines that were installed during the late sixties and early seventies. Planning studies for the past several years have indicated a need for additional peaking capacity beyond what is already in operation or under construction starting in the early to mid-nineties. Evaluation of technologies which are practical for use on the Duke system show that the technologies available to supply that peaking capacity included the use of combustion turbines. Based on these considerations, Duke management decided in late 1986 that a generic combustion turbine specification should be developed. The development process for that specification is described.

36132 (EPRI-AP—5702, pp 4.1-4.15) **Operating experience as an aid in procurement of gas turbines with improved RAM characteristics.** Knauf, C.L. Jr. Mar 1988. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920242/JAW.

In Gas turbine procurement: 1987 workshop: Final report.

The importance of operating experience in the procurement of gas turbines with improved ram characteristics is discussed. Why operating experience is important, sources of help in gaining operating experience to aid in the procurement process, and the questions that should be asked in obtaining this help are discussed.

36133 (EPRI-AP—5702, pp 5.1-5.54) **Combustion turbine procurement: a turnkey approach.** Nikkels, H. (Anchorage Municipal Light & Power, AK (USA)). Mar 1988. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920242/JAW.

In Gas turbine procurement: 1987 workshop: Final report.

Until the late 1970's, Anchorage Municipal Light & Power primarily utilized conventional design-purchase-construct contracting procedures to procure and install most of its generating facilities. Many of the problems with these projects could be attributed to lack of sufficient permanent staff to deal with consultants or to provide adequate site management. This situation encouraged inadequate engineering, weak estimates, poor job control, cost overruns and subsequent legal actions. To compound procurement problems, AML & P had responsibility of the projects, but final financial authority rested with the Municipal Assembly. In 1978, AML & P needed to purchase a new combustion turbine and waste heat cycle addition. Some successes in the mid 1960's encouraged AML & P to procure the equipment on a complete turnkey basis, with single source responsibility. The intent was to simplify engineering overview and project management to the point where it could be handled by a single qualified, permanent AML & P employee. To date, AML & P has used this process to purchase two combustion turbines in the 75 MW range, a waste heat addition for one of those units, steam cycle improvements, a major switchyard addition, and

numerous pieces of installed plant hardware. While any procedure can be improved, the projects were considered successful in that they met expectation, were completed on time, required little draw on a small utility's manpower resources, and had no cost overruns. What AML & P has learned in utilizing this method of combustion turbine procurement is discussed.

36134 (EPRI-AP—5702, pp 6.1-6.36) **Reliability, availability, and maintainability considerations for gas turbine procurement.** Dohner, C. (Electric Power Research Institute, Palo Alto, CA (USA)). Mar 1988. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920242/JAW.

In Gas turbine procurement: 1987 workshop: Final report.

Reliability, availability, and maintainability considerations for gas turbine procurement are presented in outline form. Information is presented on EPRI advanced gas turbine reliability goals, forced outage data by plant areas, critical components, system criticality ranking, and the apportionment of goals and the application of techniques.

36135 (EPRI-AP—5702, pp 7.1-7.34) **How good are your specifications and what would you do differently in planning your next gas turbine power plant.** Zanyk, J.P. (Dow Chemical of Canada, Ltd., Sarnia, Ontario (Canada)). Mar 1988. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920242/JAW.

In Gas turbine procurement: 1987 workshop: Final report.

Steps to go through in planning gas turbine power plants are discussed. The importance of reliability and avoidability is outlined. The following topics are discussed: harmonic stability problems, gas turbine specifications, specific items that are essential for good reliability and performance, compressor on-line/off-line washing, vibration and bearing temperature monitors, maintenance and warranties, by-pass exhaust stack, heat recovery steam generators, and data collection and performance monitoring.

36136 (EPRI-AP—5702, pp 8.1-8.19) **Chesterfield 7: combined cycle repowering with GE's 7F: procurement aspects.** Catina, J.L. (Virginia Electric & Power Co., Richmond (USA)). Mar 1988. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920242/JAW.

In Gas turbine procurement: 1987 workshop: Final report.

Prior to 1985, the Virginia Electric and Power Company's primary generation expansion efforts had been directed toward the construction of 750 MW pulverized coal units in the mid-to-late '90's. However, in 1985 the company's 15-year load forecast indicated a dramatic increase in growth, signaling a need for additional generating capacity by the early 1990's. Thus, the company increased its investigation of alternative generating technologies. With the substantial risk that the difference between forecasted growth and demand growth will alter the feasibility of plans made today, flexibility is the key. Combined cycle systems offer considerable construction and operating flexibility and, along with contingency provisions for later coal gasification, are currently among the company's preferred alternatives. In 1985 the company began the first phase of a detailed study of repowering the two retired (1944 vintage; 800 psi, non-reheat) pulverized coal units at Chesterfield Station with 300 to 400 MW of combined cycle units with a planned completion data of 1994. The detailed finding of this first phase have been previously presented, and the results indicated that the most efficient, highest output and easily installed option was two GE 7F combustion turbines, combined with two HRSGs supplying 1450 psi reheat steam to two steam turbines. The study presented a conceptual design for this 400 MW system which could be phased in as two separate units. The original plan was to proceed toward a more detailed study of this option in 1986. However, by this time the 1986 Load Forecast indicated that 200 MW would be required in 1990, causing an abrupt acceleration of the plans for a new unit. The repowering of Chesterfield 1 and 2 units is discussed.

36137 (EPRI-AP—5702, pp 9.1-9.29) **Specification and purchase of gas turbine generator systems for high reliability and availability.** Schreiber, H. (Electric Power Research Institute, Palo Alto, CA (USA)). Mar 1988. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920242/JAW.

In Gas turbine procurement: 1987 workshop: Final report.

The purchase and installation of a utility combustion turbine generator plant represents a sizeable capital outlay, and a commitment to expand operating and maintenance funds potentially far greater than the first cost, during its economic life over the next twenty or thirty years. Consequently, short cuts and expediencies forced by schedule constraints can be extremely detrimental and can have a profound effect not only on the life cycle cost of the equipment but on the cost of replacement power that may have to be bought due to its forced unavailability. An understanding of the effect of the trade-offs between first cost and life cycle cost is an important factor in making procurement decisions. The key ingredients of a good procurement are discussed.

36138 (EPRI-AP—5702, pp 10.1-10.15) **Control options in gas turbine procurement.** Quentin, G.H. (Electric Power Research Institute, Palo Alto, CA (USA)). Mar 1988. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920242/JAW.

In Gas turbine procurement: 1987 workshop: Final report.

The instrumentation and control systems for new gas turbines are supplied by the manufacturer as an integral package with the new machine. This generally limits the options which the purchaser has open to him. The gas turbine user must be aware how the control system on a new turbine will impact his operation and maintenance procedures. Although the new control technology has much in its favor, and generally provides the same engine control functions, it will not appear the same to operators and maintenance technicians as older control equipment. Therefore, it is advisable to consider the instrumentation and control packages during the procurement process. The role of gas turbine instrumentation and controls is examined to provide some understanding of their impact on operation and maintenance. With this background, the buyer will have a better perspective on the options available to him in the procurement process, and how the best specifications may be put forward. Properly designed gas turbine controls can help to: maximize overall unit performance; sustain high levels of starting and running reliability; keep downtime at a minimum to assure availability; and, provide flexibility in meeting operating goals. These capabilities have become increasingly more important as gas turbines themselves have developed over the past 25 years, with increasing engine size and specific output.

36139 (EPRI-AP—5702, pp 11.1-11.18) **If money were no object.** Etheridge, V.W. (Salt River Project, Phoenix, AZ (USA)). Mar 1988. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920242/JAW.

In Gas turbine procurement: 1987 workshop: Final report.

How future gas turbine purchase specifications for the Salt River Project would be influenced by operating and maintenance experience over the past 16 years is discussed. The ideas expressed are the results of input from Plant Superintendents, Plant Engineers and Plant Operators. No attempt to justify the cost of any options on future purchases is made. There are so many variables that influence cost and return on investment that this must be done on a case-by-case basis. The Salt River Project (SRP) is a political subdivision of the State of Arizona. It was created to provide a reliable source of water for the farmers in central Arizona shortly after the turn of the 20th century. Money was borrowed from the federal government to build the Theodore Roosevelt Dam on the Salt River. Hydroelectric power generating equipment was installed in a powerhouse at the dam. Over the years the business has grown to include diesel engine driven generation, gas, oil and coal-fired steam generation, combustion turbines and most recently, a nuclear generating station operated by the Arizona Public Service Company. The construction and operation of the project are described.

36140 **(EPRI-AP—5815) Practical feasibility of advanced steam systems for combined-cycle power plants: Final report.** (Electric Power Research Inst., Palo Alto, CA (USA)). May 1988. 112p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011432/JAW.

Over the past decade, advances in gas turbine design have lead to significant advances in the performance of simple cycle units. Higher turbine outlet temperatures with modern gas turbines provide an opportunity for improvements in the steam bottoming cycle of combined cycle configurations as well. This report covers the study, conducted under EPRI Project RP2052-2, to evaluate the practical feasibility of various steam cycle improvement approaches. The concept of "Fully Reserved Cost of Electricity" (FRCOE), developed for assessing the practical merits of proposed cycle improvement schemes, is described. FRCOE assigns cost penalties for the loss of availability or increased uncertainty due to any complexity introduced by these schemes. Experience with existing units incorporating advanced features is described, together with the technology limits to some of the advanced features. Practical feasibility assessments of steam bottoming cycle configurations, such as multiple steam pressures and reheating, are presented. Assessment of adjustments in steam cycle parameters included steam throttle pressure, superheater approach, pinch point, economizer approach and condensing pressure. Using data for a representative advanced gas turbine and conservative component availability estimates, the assessments found that lowering the pinch point has the greatest beneficial effects on the FRCOE. Favorable FRCOE results from two-pressure and nonreheat cycles. Only minor benefits acrue from lower superheater and economizer approaches, and throttle pressures above 1500 psi. There is no universally optimum system. At low fuel costs and low capacity factors, cycle improvements leading to loss of availabilility are not found to be economically justifiable. Conversely, at high fuel costs and capacity factors, these complex high performance cycles result in economically advantageous plants. Each plant application needs to be specifically analyzed. 3 refs., 17 figs., 8 tabs.

36141 **(EPRI-AP—5822) Improved maintainability for advanced gas turbines: Final report.** Sundstrom, E.J.; Carswell, R.; Hogg, W.H.; Zanyk, Z.P.; Aaron, H.E. (Dow Engineering Co., Houston, TX (USA)). May 1988. 104p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010347/JAW.

The maintenance history of GE Frame 7 gas turbines has been reviewed. Twelve users of this equipment were surveyed. The survey addressed the physical configuration of hardware and accessories necessary to achieve minimum downtime following a forced or scheduled shutdown. Guidelines identifying areas of concern were established to improve the maintainability of gas turbines in power generation service. These criteria were reviewed with the General Electric Company's 7001F gas turbine design team during September 1984 for applicability to this new model. Several major tasks were reviewed by The Dow Chemical Company's (DOW) maintenance technicians to indicate an industrial's approach to maintenance. Goals are provided for certain tasks complete with an example of a typical hot gas path inspection, and a typical major inspection. The examples are broken down in some detail with a Critical Path Map (CPM) included in the appendix. The availability of DOW's three Frame 7 E's since installation is shown with their complete list of outages. 7 tabs.

36142 **(EPRI-CS—5692) Slag monitoring for utility boilers: Final report.** Anson, D.; Barrett, R.E.; Litt, R.D.; Paisley, M.A. (Battelle Columbus Div., OH (USA); Central Electricity Generating Board, Nottingham (UK). Operational Engineering Div.). Apr 1988. 126p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009230/JAW.

This report provides a detailed description of commercially available slag monitoring techniques and some developing concepts for slag monitoring. Slag monitoring is currently being evaluated by several organizations as a means of controlling and optimizing sootblowers. The potential benefits from slag monitoring can represent significant savings in utility operating costs. Six types of heat flux meters are described as they are presently being used in utility boilers. These direct monitoring techniques determine local conditions within the furnace. Each application is described with current results and future plans. Boiler heat balance models provide an indirect technique for monitoring the general cleanliness/fouling of major boiler sections. Each model is described with current results at a representative installation. Several developing concepts of slag monitoring are described and evaluated. Four promising concepts, acoustic attenuation, a simplified heat balance model, sonic pyrometry, and ultrasonic pulse reflection, are recommended for further development and evaluation. 16 refs., 34 figs., 4 tabs.

36143 **(EPRI-CS—5729) Condenser performance test and back-pressure improvement: Final report.** Piskorowski, J.; Beckett, G.; Bell, R. (Heat Exchanger Systems, Inc., Boston, MA (USA)). Apr 1988. 99p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009448/JAW.

This document describes condenser performance test and analyses experiences. The testing was performed by Indianapolis Power and Light Company (IPL) on the Petersburg Unit 3 condenser. The initial testing revealed a performance deficiency. Modifications were made to the condenser, air in-leakage was reduced and the vacuum pumps were brought back to their original design capacity. Testing was reperformed after these activities and although a significant performance improvement was achieved deficiencies were still evident. Heat Exchanger Systems, Inc. (HES) was retained as consultants during this testing program. The Central Electricity Generating Board's (CEGB) Central Electricity Research Laboratory (CERL) acting as a subcontractor to HES were retained to perform an analysis of the Petersburg Unit 3 condenser using their EPOC computer code. The results of this analysis are also contained in this document. 3 refs., 48 figs., 3 tabs.

36144 **(EPRI-CS—5776) Multisystem corrosion monitoring in a cyclic reheat test facility: Phase 1.** Farrell, D.M.; Cox, W.M.; Gearey, D. (University of Manchester Inst. of Science and Technology (UK). Corrosion and Protection Centre Industrial Services). Apr 1988. 120p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009302/JAW.

The work described in this report was the first stage of an EPRI-sponsored corrosion investigation utilizing the CAPCIS electrochemical monitoring system installed in a cyclic reheat test facility on a flue gas slipstream at the Scholz Steam Plant of Gulf Power Company. The primary reasons for incorporating the continuous corrosion monitoring system in the cyclic reheat investigation were that unexpectedly high corrosion rates had been observed in earlier tests at certain locations within the test exchanger and the precise reasons for these high rates of attack were not well understood. The corrosion behavior was not typical of the limited service experience on full scale units and the reasons for this required clarification. Controlled temperature weight loss and electrochemical probes were installed in the unit in place of three of the 1-inch diameter heat exchanger tubes. The corrosion behavior of Inconel Alloy 625 over the temperature range 260{degree} to 120{degree}F (127{degree} to 49{degree}C) was evaluated at midstream and sidewall locations. The efects on corrosion of operational variables and cleaning procedures were also evaluated. The severe corrosion attack sustained on the Inconel Alloy 625 was proved to result from a combination of effects which included the flue gas flow pattern, local cool-spots within the unit and preferential locations at which ash deposits could accumulate. 5 refs., 50 figs., 17 tabs.

36145 **(EPRI-EL—5814) The eddy-current technique for nondestructive evaluation of generator retaining rings: Feasibility study: Interim report.** Elmo, P.M.; Nottingham, L.D. (Jones (J.A.) Applied Research Co., Charlotte, NC (USA)). May 1988. 68p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010353/JAW.

An evaluation of the feasibility of using eddy current nondestructive inspection techniques to detect intergranular stress corrosion in generator rotor retaining rings was conducted by the EPRI NDE Center. Experiments were conducted using a bend-bar containing representative stress corrosion damage, a calibration block containing electrical discharge machined (EDM) notches, and four

retired retaining rings containing EDM notches and stress corrosion damage. An eddy current transducer transport was designed and fabricated to interface with an existing computer-controlled, two-axis positioner and digital eddy current data acquisition system. Test results of experiments performed with this equipment on the retaining ring test-bed provided experimental validation of the eddy current method's feasibility as a retaining ring inspection method. Details are given of the system and its performance under laboratory and simulated service-inspection conditions. 9 refs., 47 figs.

36146 **(EPRI-NP—5542) Flow velocity and turbulence measurements in a laboratory-scale steam generator model: Final report.** Yu, J.H.Y. (JAYCOR, San Diego, CA (USA)). May 1988. 75p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011424/JAW.

A series of velocity measurements was conducted in a 1/5 scale model Westinghouse D4 steam generator entrance section (waterbox). Single sensor constant-temperature hot-film probes aligned in sequence with x,y,z axes or various locations were used to obtain information on the velocity distributions in the waterbox. The linearized outputs were processed to obtain the mean, root mean square (rms), and spectral distributions of the components normal to the sensor axes. Some interesting features pertaining to the velocity and spectral distributions caused by the unique waterbox geometry were revealed. 25 figs., 4 tabs.

36147 **(EPRI-P—5788-Vol.1) Residual fuel oil quality: Market trends and management options: Volume 1, Analysis: Final report.** (Pace Consultants, Inc., Houston, TX (USA)). May 1988. 178p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011127/JAW.

The recent deterioration in the quality of residual fuel oil available to electric utilities has resulted in operating problems for several utilities. In light of these concerns, Pace Consultants has conducted a study sponsored by EPRI and several utilities to determine how quality has changed and to develop a reasonable forecast of future expectations. The study has shown that lower quality resid is due to sharply reduced demand, which has increased the concentration of cracked stocks in the average barrel of residual fuel oil. Other contributing factors include poorer crude oil quality and increased blending of sometimes incompatible stocks. Although future residual fuel oil quality is not expected to significantly worsen on average, certain market conditions may lead to periods of poorer quality. Utilities have attempted to cope with this problem in several ways. Measures include tightening specifications, altering operations, revising strategies and using additives. While these methods have been partially successful, no single solution has been completely effective. This report discusses several recommended procedures based on the findings of the Pace study. 65 figs., 31 tabs.

36148 **(NEI-DK—57) Decentral combined power and heat. Report from a seminar about decentral combined power and heat plants.** (Dansk Brandvaerns-Komite, Birkeroed). Mar 1987. 58p. (In Danish). (CONF-8702138—Absts.). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752832/JAW.

From Seminar on decentral combined power and heat plants; Ballerup, Denmark (4 Feb 1987).

This seminar had two main purposes - an illustration of the possibilities of Danish industry to develop knowhow and technology in connection with the power plants extension with decentral combined power and heat plants and an illustration of the technical, operational economy and environmental aspects attached to decentral combined power and heat production. The building program is kept within a power limit of 450 MW. The first phase of the program between 80-100 MW is for testing and demonstration. This report presents - in abstract form - central thermes from the debate which took its starting point at the lectures and the discussion. (SM).

36149 **(SVF—287) Energy management systems for heat production plants.** Wester, L.; Schuster, R. (Energiteknisk Utveckling AB, Trosa (Sweden); Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Nov 1987. 36p. (In Swedish). (ETU—6040-03). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752992/JAW.

This paper deals with different variables which influence the solution of the problem, different mathematical models that could be used to solve the problem etc. Two commercial systems are briefly described. Experiences from small heat production systems show that even very simple computational aids could be very valuable if they actually mean that calculations are carried through. In many cases today people avoid calculation because of incapability to do calculations or unfamiliarity with calculations. In three areas suggestions are put forward for further investigations. The areas are: - The performance of heat storage combined with production of electricity. - Investigation of the energy production systems in industries with high energy demands. - Information to/education of the staff of smaller production units to promote calculations. (authors).

36150 **A method for improving load turndown in fluidized bed combustors.** Brown, R.C.; Foley, J.E. (Dept. of Mechanical Engineering, Iowa State Univ., Ames, IA 50011 (US)). *Industrial and Engineering Chemistry Research;* 27: No. 1, 24-29(Jan 1988).

The authors investigate a new concept in the design of fluidized bed combustors that improves load turndown capability. This design is based on control of heat-transfer rate independent of combustion rate. The configuration under investigation consists of a central combustion bed surrounded by an annular fluidized bed that establishes overall heat-transfer rate from the inner combustion bed. The two beds are fluidized independently by separate air plenums. Experiments were performed to evaluate the usefulness of this device in improving load turndown. For a given combustor firing rate and air-to-fuel ratio, a wide variation in combustion temperature could be achieved by controlling the flow of fluidization air to the annular fluidized bed. In other tests, a load turndown ratio of 8.7 was achieved while combustion temperature was held constant.

36151 **Prediction and in situ measurement of the thermal conductivity of multiphase fouling deposits formed in direct coal-fired combustors.** Ross, J.S.; Ramezan, M.; Anderson, R.J.; Nagarajan, R. New York, NY; American Society of Mechanical Engineers (1987). 8p. (CONF-871234—). American Society of Mechanical Engineers, 345 East 47 St., New York, NY 10017.

From ASME winter meeting; Boston, MA, USA (13 Dec 1987).

Technical Paper 87-WA/HT-6.

The fractional reduction in heat transfer from hot combustion gases due to the buildup of a fouling deposit layer on turbine blades in a coal-burning combustion turbine is determined primarily by the time-dependent thermal conductivity of the evolving deposit. These deposits are three-phase mixtures comprised of supermicron fly ash particles, vapor-deposited "glue"-liquid (usually molten alkali sulfates) and interstitial gas. The authors exploit here a rational approach to the prediction of the thermal conductivity of multiphase sintering deposits that incorporates additive resistance formulations yielding its dry-(no glue) and wet-(no gas) limiting values. Also included in the model is the sensitive response of deposit thermal conductivity to small glue volume fractions which are calculated on the basis of a model of self-regulated sticking. This theory has been applied to predict the change in surface temperature of a platinum target with deposit formation. Time-resolved measurements of target metal temperature obtained by multicolor optical pyrometry are used to monitor the effect of deposit layer growth on the inner surface temperature. Illustrative computations and preliminary comparisons with experimental data are presented here and tentative conclusions are drawn regarding the appropriateness of our descriptive/predictive model for deposit thermal conductivity.

36152 (BNL—41201) Potential reductions in US CO_2 emissions in 1995 and 2010 by technology improvements in electricity generation and transportation sectors. Cheng, Hsing C. (Brookhaven National Lab., Upton, NY (USA)). Apr 1988. Contract AC02-76CH00016. 41p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010662/JAW.

By combining the current most efficient energy technologies in electricity generation and transportation sectors and their estimated market penetrations, the resultant possible fossil-fuel savings in the US in 1995 and 2010 were estimated. The improved technologies considered are either already commercially proven or are based on prototypes or advanced developments that could lead to commercialization in the near future. The baseline energy consumption projections based on the year-1985 energy technologies presently in practice were obtained from the reference case of the {open<-quotes}National Energy Policy Plan Projections to 2010{close<-quotes} (NEPP 1985). Two technology scenarios, designated as low and high estimates, were constructed to reflect the relative expectations of the performance and the rate of deployment of improvednew technologies. The resulting scenario should be regarded neither as indicating the upper limit on the potential reductions in the US CO_2 emissions nor as a forecast of what will happen. 10 refs., 2 figs., 17 tabs.

36153 (CONF-880403—2) Use of audibility analysis to minimize community noise impact of today's smaller generation facilities located near residential areas. Leibich, R.E.; Cristoforo, M.P. (Argonne National Lab., IL (USA); United Engineers and Constructors, Inc., Philadelphia, PA (USA). Environmental Engineering Dept.). 1988. Contract W-31-109-ENG-38. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012059/JAW.

From American power conference; Chicago, IL, USA (25 Apr 1988).

This paper is intended to demonstrate practical applications of the Fidell-Horonjeff audibility model (2) to the analysis of power plant noise sources, such as cooling towers, transformers, pumps, ventilation fans, mobile diesel-powered yard equipment, loudspeaker systems, and even sodium-vapor-type outdoor lighting. Because plant-design engineers currently are relatively unfamiliar with the Fidell-Horonjeff model, the first part of this paper summarizes and reviews the model.

36154 (CRIE-T—86089) Literature data base of atmospheric diffusion (part 1). Senshu, Toshio; Fujita, Shin'ichi; Ichikawa, Yoichi; Komabayashi, Riichi; Sada, Koichi. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jun 1987. 31p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88770187/JAW.

This survey is a part of data base investigation (started in 1985) by the Komae Research Laboratory of the Central Research Institute of Electric Power Industry; literatures on the atmospheric diffusion of exhausted smoke were selected respectively with an abstract as well as with an assessmant. This data base can be retrieved by the classification, title, author's name, magazine name, date of issue, and key words of the literature. For 1986, approximately 100 reports were assessed. Contents are: Analysis of wind and temperature field. Atmospheric diffusion model of exhausted smoke. Wind tunnel experiment. Long distance transportation of oxidant, etc. Acid rain, etc. These literature data are regarded useful for the power plant location together with the data concerning the influence of atmospheric contamination on health, influence of marine organisms, and off-shore diffusion data, etc. (4 tabs, 93 refs)

36155 (DOE/EIS—0125-F) Intertie development and use: Final environmental impact statement: Volume 4, Appendices. (USDOE Bonneville Power Administration, Portland, OR). Apr 1988. 602p. NTIS, PC A99;3. Order Number DE88011464/JAW.

Appenxix A contains supplemental data on socio/economic considerations as well as data on the natural resources environment. Information is arranged in the following order: geography/land use (Tables A.1 and A.2), power resources/resources mix (Tables A.3 through A.8), other uses of river systems (Table A.9), air quality (Tables A.10 through A.15), water quality/fish (Tables A.16 through A.19), and wildlife and vegetation (Tables A.20 and A.21).

36156 (DOE/METC—88/6084-Vol.2) Proceedings of the AR&TD [Advanced Research and Technology Development] direct utilization, and instrumentation and diagnostics contractors review meeting: Volume 2. Holcombe, N.T. (ed.). (USDOE Morgantown Energy Technology Center, WV; USDOE Pittsburgh Energy Technology Center, PA). Oct 1987. 405p. (CONF-871041—Vol.2). NTIS, PC A18/MF A01;1; GPO Dep. Order Number DE88001003/JAW.

From Advanced research and technology development direct utilization; Morgantown, WV, USA (13 Oct 1987).

The Advanced Research and Technology Development (AR&TD) Direct Utilization, and Instrumentation and Diagnostics Contractors Review Meeting was held on October 14-16, 1987, at the Sheraton Lakeview Conference Center in Morgantown, West Virginia. This meeting was sponsored by the US Department of Energy (DOE), Office of Fossil Energy, and the Morgantown and Pittsburgh Energy Technology Centers, and this year was hosted by the Morgantown Energy Technology Center. This annual meeting provides a forum for the exchange of information between DOE AR&TD contractors and interested parties and was attended by approximately 200 individuals from industry, academia, national laboratories, and other Governmental agencies. Papers were presented on ongoing research and research results relating to combustion phenomena, coal properties, cleanup, mineral-matter transformations, pyrolysis, atomization, instrumentation, erosion/corrosion, and deposition. A total of 12 technical sessions were chaired by staff from both the Morgantown and Pittsburgh Energy Technology Centers. Conference coordination was provided by the Conference Services staff of EG&G Washington Analytical Services, Inc., Morgantown Operations. The proceedings have been reproduced from camera-ready manuscripts furnished by the authors. They have not been refereed, nor have they been extensively edited. Papers have been entered individually into EDB and ERA.

36157 (DOE/PC/81006—T1) SO_2NO/sub x/ removal by $Ca(OH)_2$. Chu, P.; Rochelle, G.T. (Texas Univ., Austin (USA). Dept. of Chemical Engineering). [1988]. Contract FG22-85PC81006. 76p. NTIS, PC A05. Order Number DE88010148/JAW.

Previous workers have shown that simultaneous SO_2NO/sub x/ removal can be obtained in a dry scrubbing system with Ca(OH)/sub 2/produces more reactive solids and product recycle improve the reactivity of the solids toward SO_2. To test SO_2NO/sub x/ removal with fly ash and products recycle, bench-scale experiments with a packed bed reactor were performed at bag filter conditions. The most reactive solid fo NO/sub x/ removal was prepared by slurring $Ca(OH)_2$ with fly ash, $CaSO_3$, and NaOH. The best conditions for NO/sub x/ removal were high temperatures (tested up to 125{degrees}C) and high concentrations of SO_2 (tested up to 1500 ppM) and O_2(tested up to 20%). At the best conditions, NO/sub x/ removed in 1 hour was 3 to 4 moles per 100 moles $Ca(OH)_2$, compared to 5 to 10 moles SO_2 removed per 100 moles $Ca(OH)_2$. For the greatest SO_2 removal, it was necessary to prepare solids by slurring $Ca(OH)_2$ with fly ash and NaOH. The best SO_2 removal was obtained at higher relative humiditieslower temperatures. At these conditions, SO_2 removal in 1 hour was 60 to 80 moles SO_2 per 100 moles Ca $(OH)_2$, compared to 0.5 to 1 moles NO/sub x/ removed per 100 moles $Ca(OH)_2$. NaOH played an important role in SO_2 and NO/sub x/ removal - as an improvement to fly ash dissolution, as a deliquescent, and as possible catalyst for NO/sub x/ removal. When slurried with fly ash and NaOH, $CaSO_3$ substantially improved the solids reactivity toward NO/sub x/, but did not affect SO_2 removal. No optimum temperature for simultaneous SO_2NO/sub x/ removal was found. NO/sub x/ removal increased with temperature while SO_2 removal decreased. 32 refs., 24 figs., 16 tabs.

36158 (EPRI-CS—5734) Multisystem corrosion monitoring in FGD [flue gas desulfurization] systems, Phase 2. Farrell, D.M.; Cox, W.M.; Gearey, D. (University of Manchester Inst. of Science and Technology (UK). Corrosion and Protection Centre Industrial Services). Apr 1988. 125p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009447/JAW.

This report describes the second stage of an EPRI-sponsored investigation of on-line electrochemical corrosion monitoring at the R.M. Schahfer Generating Station, conducted by the Corrosion and Protection Centre Industrial Services, Manchester, UK. Controlled temperature weight-loss and electrochemical probes were installed in the post-reheater flue duct of a dual alkali FGD scrubber to evaluate the corrosion of Type 316L stainless steel over the temperature range 100{degree} to 160{degree}F. The effect on corrosion rate of transient operational conditions was also investigated. It was found, on this installation, that the maximum corrosion attack was sustained in the temperature range 125{degree} to 136{degree}F and was equivalent to a maximum pitting rate of the order of 4 mm/y. Surveys of the metal temperature in the post reheater and plenum chamber ducts revealed that many sections of the installation continuously operated within the critical range for maximum attack despite indications from conventional process instrumentation that the corrosion risk was minimal. It is concluded that the continuous multi-technique monitor is a useful tool with which to evaluate the corrosion behavior of materials exposed to attack by aggressive films of condensate. This approach can show when measures to prevent or minimize corrosion have been successfully implemented. The instrument provides the operator with a cost-effective method of obtaining a continuous indication of compliance within safe operating parameters. 57 figs., 11 tabs.

36159 (EPRI-CS—5782) Laboratory characterization of advanced SO_2 control by-products: Spray dryer wastes: Final report. Thompson, C.M.; Achord, R.D.; Blythe, G.M. (ICF Technology, Inc., Richland, WA (USA); Electric Power Research Inst., Palo Alto, CA (USA)). May 1988. 233p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010995/JAW.

This report on the solid waste characterization of spray dryer wastes is the first in a series of five advanced SO_2 control waste characterization reports resulting from Task 2 of Research Project 2708-1. Task 2, Solid Waste Characterization, involved a detailed characterization of solid waste products based on literature and property determinations. The chemical, physical, engineering, and leaching properties of spray dryer wastes will be used to support the evaluation of waste management design and operation and potential utilization in Tasks 3 and 4 of this project. Results indicate that spray dryer wastes, although varied in chemical composition, can be handled in conventional collection, transportation, and storage systems designed for fly ash. These waste management systems will require designs that are capable of handling larger volumes and masses of dry waste materials. Chemical differences between spray dryer wastes and fly ash are greater than the physical and engineering property differences. Spray dryer wastes were nonhazardous and could be disposed in landfills. Utilization of spray dryer wastes as mineral admixture in Portland cement concrete and blended cements might be limited by chemical compositional requirements specified for reuse.

36160 (EPRI-CS—5849) Introduction to limestone flue gas desulfurization: Videotape workbook. (Electric Power Research Inst., Palo Alto, CA (USA); Radian Corp., Austin, TX (USA)). 1988. 32p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010695/JAW.

The workbook is designed to accompany the Electric Power Research Institute's (EPRI's) videotape, "Introduction to Limestone Flue Gas Desulfurization." To complement the videotape, the workbook provides additional information on limestone flue gas desulfurization (FGD) and a guide to sources of still more information. The videotape itself presents an introduction to the chemistry involved in a limestone FGD system. Following a description of a typical system, the basic chemical reactions that occur in this process are detailed. The most common operation problems in limestone FGD—low sulfur dioxide removal, low limestone utilization, and scaling—are reviewed with regard to how process chemistry can be controlled to alleviate these problems. This tape is an introduction only; future tapes will cover limestone FGD performance indicators and troubleshooting in more detail.

36161 (SNV—3147) High voltage power lines. Formation of noise and air pollutants. (National Swedish Environmental Protection Board, Solna). Mar 1986. 55p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752943/JAW.

This report on noise and ozone pollution from power transmission lines is based on measurements in Sweden and literature studies of North American experiences. Noise levels of 40-50 dBA are not uncommon at houses close to existing 400 kV lines in Sweden. Complaints are however few. For the future it is recommended that the noise level should be kept below 40-45 dBA at houses in areas with low noise levels and below 45-50 dBA in more densly populated areas. According to experiments performed, ozone production from power lines is only a very marginal environmental problem. With 17 refs.

36162 (SVF—263) Separation of mercury from filter dust. Hall, B.; Ljungstroem, E.; Lindqvist, O. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). May 1987. 57p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752987/JAW.

In experiments with flue gas (8% oxygen) and with metallic mercury added, (150/my/g/m/sp3/, 25 degrees C, 1 bar, ca. 18 ppb) about one third of the mercury is oxidized after 0.5 s residence time in the duct, after which time, the gas temperature has fallen to about 500 degrees C. The oxidized species formed is gaseous and easily reduced. The elemental mercury concentration also shows a tendency to fall along the duct which indicates that the oxidation process continues also at temperatures between 200 and 500 degrees C. The behaviour of the oxidation product is consistent with what is expected from the equilibrium and vapour pressure data for HgO. The reaction with hydrogen chloride appears to stop before the gas temperature has fallen below 500 degrees C. The final reaction product differs from that in the 'clean' experiments since all added mercury is recovered as total mercury along the duct. This shows that the compound formed is volatile and easily reduced which indicates that the product is HgCl/sb2/. When sulphur dioxide is added, almost all mercury is present as metallic mercury along the duct. A notable reduction of the concentration of metallic mercury is obtained when activated carbon (0.5-1.0 g/m/sp3/, 25 degrees C,1 bar) is added to the flue gas while the total mercury concentration is only slightly reduced. The carbon that was collected in the fabric filter at 150 degrees C contained 40-60 ppm mercury (/my/g Hg/g carbon) which corresponds to between 13 and 20% of the mercury added. (authors).

36163 (SVF—288) Condensation of flue gas - Description of installations and operation experience of plants fuelled by means of wood fuels. Dahlen, G.; Haegglund, L. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Nov 1987. 146p. (In Swedish). NTIS (US Sales Only), PC A07. Order Number DE88753352/JAW.

The experiences show that the systems operate satisfactorily today and that mainly there are two methods represented. One method is the indirect cooling of the fluegas in the heat exchangers and the other is direct cooling of the fluegas in the scrubber. At the wood-fired plants reported in this investigation where the predivision of dust takes place in the dust collection unit a sufficient amount of alcalic dust is received together with the fluegas which acts as a means of neutralization when condensing. At those plants where the purification of the fluegas takes place in an electric filter before the condensation an acid condensate is received. It has not been made clear whether this significant difference of the pH-value of the condensate depends on the equipment for the purification of the fluegas, the combination of the wood or the firing technique. There are corrosion problems at some plant but mostly normal kinds of stainless steel or plastic material, alternatively, can be used. Normally, it should be possible to add the condensate to the waste water net without purification or after the separation of the particles, provided it is neutral or slightly alcalic. At these plants the

costs of investments for the indirect methods are higher than those of the scrubber methods. (authors).

36164 **Filter unit for use at high temperatures.** Ciliberti, D.F.; Lippert, T.E. (to Dept. of Energy, Washington, DC). US Patent 4,735,638. 5 Apr 1988. Filed date 18 Nov 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A filtering unit for the filtering of particulates from a particulate-containing high temperature gas stream is described comprising a ceramic, tubular filter element, having a closed bottom and side walls and an open top at the upper region thereof, disposed in an aperture in a tube sheet. The walls of the tube sheet about the aperature have an inwardly extending flange thereon, with the open top of the ceramic, tubular filter element adjacent one surface of the tube sheet where filtered gases are discharged, and the closed bottom and side walls exposed to the area of the opposite surface of the tube sheet where a particulate-containing high temperature gas stream to be filtered is present. A ceramic spiral spring is provided at an end of the ceramic, tubular filter element to bias the upper region of the ceramic, tubular filter element into contact with the flange so as to seal the ceramic, tubular filter element to the flange on the tube sheet.

36165 **(BNL—41289) Conductor loss in superconducting power transmission cables.** Forsyth, E.B. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 10p. (CONF-880466—3). NTIS, PC A02;3. Order Number DE88011414/JAW.

From Conference on superconductivity and applications; Buffalo, NY, USA (18 Apr 1988).

An analytic solution for the hysteretic loss in a Type II superconductor has been derived which is analogous to hysteretic loss in ferromagnetic materials subjected to weak alternating fields. In practice the losses in a practical conductor design are increased above the intrinsic loss due to such effects are grain size, surface roughness and the addition of other metallic components. The choice of conductor configuration also affects the losses. Flexible conductors, for example, exhibit further loss mechanisms due to circulating currents and proximity effects. Quantitative results are compared with theory. 30 refs., 6 figs., 1 tab.

36166 **(CONF-880701—1) Instrumentation system used to determine the effects of steep front short duration impulses on electric power system insulation.** Shaw, J.H. (Cooper Industries, Inc., Franksville, WI (USA). McGraw-Edison Power Systems Div.). 1988. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88007483/JAW.

From IEEE Power Engineering Society summer meeting; Portland, OR, USA (24 Jul 1988).

This paper describes an instrumentation system used to acquire data on the effects of steep front short duration voltage impulses on electric power system insulations and equipment. The instrumentation arrangement, shielding and performance experiences are applicable to researchers who need to meter high voltage, high frequency transients. This research work is sponsored in part by the Office of Energy Storage and Distribution of the Department of Energy (DOE). 6 refs., 3 figs.

36167 **(CONF-880734—3) The HEMP [high altitude electromagnetic pulse] response of an overhead power distribution line.** Tesche, F.M.; Barnes, P.R. (E-Systems, Inc., Greenville, TX (USA); Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 8p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88006675/JAW.

From IEEE PES summer meeting; Portland, OR, USA (25 Jul 1988).

A study of the HEMP response of a realistic power distribution system was undertaken, and its results are described in this paper. This study involved the following elements: (1) the use of the new HEMP environment, (2) the use of a multiconductor coupling model, and (3) the measurement of the pulse response of an actual distribution transformer to permit the use of this data in the analysis.

36168 **(CRIE-T—86065) Corona cage study on prediction of AN and RI generated from HVDC trasmission line.** Nakano, Yukio; Sunaga, Yoshitaka. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jul 1987. 43p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752540/JAW.

Corona cages have been in use as a means for predicting AN and RI generated from DC transmission lines. The static conductor surface gradient is used as the main variable in predicting corona performance of AC transmission line. However, this method cannot be applied to DC transmission lines because the effects of space charges resulting from corona discharge vary with the conductor configuration and the polarity arrangement. In this study, the maximum conductor surface gradient, Fmax, in the presence of space charge is introduced as the main variable and it is shown that the corona current, AN and RI at Fmax do not depend on the electrode systems around a conductor bandle. Based on these results, this report proposes a technique by which AN and RI generated by transmission lines can be predicted directly from results of corona cage tests. The introduction of the proposed method requires only the replacement of conductors in the corona cage, permitting low-cost, efficient prediction compared to conventional techniques. (12 figs, 6 tabs, 18 refs)

36169 **(CRIE-T—86067) Model study of the effects of wind on DC corona current. Wind tunnel experiment by means of reduced size model.** Amano, Yuji; Hirayama, Yoshiyuki. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jul 1987. 41p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88770186/JAW.

A phenomenon wherein ion current charge voltage on the leeward side and ground-surface electric field significantly increase when wind blows across the DC transmission line, is desired to be quantitatively clarified for the prediction of ion flow electrification of the surrounding objects. An experiment was conducted by installing a DC testing model (1/50 size) in a large diffusion type wind tunnel. As a result, it was found possible to assess the dependency of corona current (generating from the respective wire) on the wind velocity by the ratio of wind velocity and the ion transfer velocity) regardless of the configuration of wires and poles. This indicates that the generated amount of corona current which is the basic amount for predicting the ion flow electrification in the DC power transmission wires can be accurately predicted. (34 figs, 4 tabs, 17 refs)

36170 **(CRIE-T—86070) Protection and control method by using online data on distribution system (part 2). Network-recognition method for operation algorithm.** Yukihira, Kenzo; Inoue, Yukio; Miyauchi, Motomitsu. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jul 1987. 23p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88770189/JAW.

Such a high level of control as preventing of electricity stoppage at the time of accident can be made possible if remotecontrolled line switches with built-in voltage and current sensor are installed at multiple points in the distribution lines collecting the informations of switching (open or not) conditions and the electrical informations. At the substation, it needs a function to comprehensively judge the incoming informations in correspondence with the system. This report describes a method of data processing to carry out the judgement on the accidented sections and control instructions for the switches. If the distribution system is expressed by a node branch method and the connecting conditions are represented by a connecting matrix, the judgement on the accidented section can be easily made for more rapid response to the change in the line conditions. Basic elements for the switching operation at the time of accident are; (1) Detection of occurence of the accident. (2) Judgement on the accidented section. (3) Search for the connection

switch. Operation of switches is based on the combination of these switches. (10 figs, 3 tabi, 2 refs)

36171 **(CRIE-T—86071) Non contactive detection method for abnormal power equipments.** Kanamaru, Yoshiaki. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Aug 1987. 39p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752539/JAW.

Electric power companies have been carried out development of sensors to serve for protection of power equipment. However, most of them are of a contact type and therefore, a trouble with them would force the equipment to be stopped. This report proposes an electric wave sensing technique for detecting abnormality in equipment. The technique measures partial discharge waves. Laboratory experiments of partial discharge wave detection are made using IEC standard electrodes. Field performance demonstration tests are also be made for the detection of partial discharge waves from a test transformer installed in the UHV Shiobara test station of Central Electric Power Research Institute. Results are used to determine the feasibility of commercialization of the technique. As a result, it is revealed that the proposed differential extraction type power equipment abnormality detection technique serves to detect electric waves resulting from partial discharge. It is most likely that further studies on quantification of detected waves and patterning of electric wave spectra will make it possible to provide a practical non-contact power equipment abnormality detection technique. (23 figs, 1 tab, 12 refs)

36172 **(CRIE-T—86072) Optimal planning method of underground distribution system.** Fukutome, Atsushi; Yoshimitsu, Tsukasa. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Aug 1987. 39p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88770190/JAW.

The underground distribution is recently made systematically, and the systematic method of underground distribution system suitable for the area in which a number of high tension and low tension power demand were complicated was developed by applying the network optimization method to utilize for the planning of the reasonable underground distribution. Topological characteristics of roads could be inputted very simply as the mapping informations and could be represented precisely as a network. Main parameters such as location of feed points etc. could be modified easily on the CRT display, through the discussion with designers. Detailed designs except main parameters were formulated as the problems to resolve optimal cable route, that is, the shortest path (or minimum cost) and determined automatically. Analysis and evaluation of the investment cost could be simplified. The effect was confirmed by the computerized simulation applying this model to a standard city block. (24 figs, 9 tabs, 2 refs)

36173 **(CRIE-T—86075) Experimental study of shielding against lightning in winter season (Part 2).** Aihara, Yoshinori; Shindo, Takatoshi. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jul 1987. 38p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752538/JAW.

In an effort to develop a theory for shielding against lightning in winter, model experiments are made for cases where transmission lines or tall structures under a uniform thundercloud are to be shielded against lightning by means of a lightning conductor tower. Major results obtained are as follows. Under a plane electrode which simulates a thundercloud, the flashover ratio of a wire conductor (model transmission line) is lower than that of a rod conductor (model lightning conductor tower). In this case, the flashover ratio of the wire conductor becomes greater as the distance from the rod conductor or the gap length decreases. When two rod conductors with different diameters are placed under a plane electrode, the flashover of the thicker rod (model tall structure) is lower than that of the thinner one. Based on these results, empirical equations are derived for the discharge rate for wire and thick rod conductors. An equation is also derived which gives the maximum height of a model transmission wire that can be shielded by the model lightning conductor tower. (21 figs, 2 tabs, 9 refs.)

36174 **(CRIE-T—86076) Temporary overvoltage flashover characteristics of contaminated insulator string under fog condition.** Takasu, Kazuhiko; Imano, Yoshio. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jul 1987. 36p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88770188/JAW.

A flashover test was conducted by a fog method which simulated the natural moist condition by installing a short time AC overvoltage generating unit. The results are as follows. (1) Time before the flashover of contaminated insulator tends to get shorter with higher overvoltage, and the minimum characteristics of the salt-contaminated insulators are constant regerdless of the type or degree of contamination. (2) AC conventional switching impulse voltage resistance of the contaminated insulator decreased by 15% in comparison with a switching impulse alone and multiplicity was 1.8 times of AC voltage wave height in the fog. (3) If duration time of overvoltage is less than 0.1 sec, the length of the insulator can be shortened by 10% in comparison with the conventional anti-contamination design method. (19 figs, 7 tabs, 18 refs)

36175 **(CRIE-T—86077) Natural contamination test of insulators with DC voltage energization at inland areas.** Takasu, Kazuhiko; Shindo, Takatoshi; Matsuda, Kyuichi. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jul 1987. 41p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752537/JAW.

The contamination characteristics of the insulator energized with DC voltage and the generation of leakage current were measured for about five years in Yonezawa, Yamagata Prefecture, hardly influenced by the briny air. This paper presents the investigation of the test results. The equivalent salt depositing density and the insoluble matter depositing density on the bottom surface of insulator exposed for a long time were approximately 0.01 and 0.06 mg/cm^2, respectively. The exposure time until the contamination on the top surface of insulator becomes almost steady in approximately one year for both depositions. The depositions on the insulators on the energizing and earthing sides were larger than that on the insulator in the middle. The equivalent salt depositing density on the insulator in the middle was almost equal to that on the non-energized insulator. The maximum leakage current on the insulator energized with DC voltage (energization intensity: 90 to 120 kV/m) was 2 to 3 mA and the annual quantity of electricity was approximately 200 coulomb. (18 figs, 15 tabs, 19 refs)

36176 **(CRIE-T—86080) Development of external cooling cryo-resistive cable systems (Part 2). Insulation characteristics on 66kV rated cryo-resistive testing cable.** Ishihara, Kaoru; Akita, Shige; Suzuki, Hiroshi; Ogata, Jun'ichi; Nemoto, Minoru. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Aug 1987. 36p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88770191/JAW.

Cryo-resistive cable system was tested to demonstrate dielectric characteristics. Dielectric characteristics of 66kV cryo-resistive cable at the start of immersion cooling in the liquid nitrogen were 2.25 specific dielectric constant and 0.18% dielectric loss which was less than 0.4%, the aimed value. Electrostatic capacity and dielectric loss tangent of dielectric characteristics under the applied voltage did not depended on the voltage and the dielectric loss was less than 0.4% through the temperature range from -170 to -190C. These values fulfilled the specifications on 275kV class cryo-resistive cable design. The tested cable passed the cable test on 66kV oil-filled cable (ac 90kV, 10min), but broken down at ac 110kV on the way to endurance testing voltage 130kV. The breakdown occurred due to the mechanical damage of cable insulator by bending and thermal contraction of the cable. It is necessary from these facts to develop flexible cable treminal and joint which can absorb the contraction to realize 275kV cryo-resistive cable. (19 figs, 7 tabs, 15 refs)

36177 **(CRIE-T—86118) Investigation of lightning protection characteristics on distribution line systems by means of observations of natural lightning. Measurements of induced lightning surges at Fukui Power Station of Hokuriku Electric Power Company (Part 4).** Yokoyama, Shigeru; Miyake, Kunihiko; Asakawa, Akira; Fukui, Sukenori; Nakamura, Masataka. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Aug 1987. 51p. (In Japanese). NTIS (US Sales Only), PC A04. Order Number DE88770192/JAW.

Lightning observation results in lightning seasons from 1984 to 1978 at Fukui Thermal Power Station were reported to clarify phenomena of the induced lightning and to demonstrate the effect of lightning protection facilities. Of 46 observed waveforms of lightning induced voltage, 18 waveforms were observed in response to waveforms of lightning induced current to the large chimney. 16 waveforms of lightning induced voltage with positive polarity in response to those of return stroke current with negative polarity and 2 waveforms of lightning induced voltage with negative polarity in response to those of return stroke current with positive polarity were observed. In both summer and winter lightnings, lightning induced voltage was caused by main discgarge and preceding lightning could be neglected. Distribution of lightning voltage along the distribution line length was observed for the first time. Lightning induced voltage peak values became lower in proportion to the distance from the nearest to the lightning induced voltage on the distribution line nearest the the lightning point. It is necessary to investigate the theoretical distribution along the line length and lightning influence on response characteristics of the distribution line to design more strict lightning resistant distribution line. (12 figs, 5 tabs, 12 refs)

36178 **(CRIE-Y—87005) Environmental design of power distribution facilities. Design study of pole-mounted equipments.** Yamashita, Yo; Wakatani, Yoshifumi; Yamamoto, Kimio. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). 17 Sep 1987. 45p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752532/JAW.

When only wires were buried in the ground and other equipments such as circuit breakers and transformers were put on streets, the environmental design including distribution facilities (pole-mounted equipments) were investigated. For this study, concrete design drafts of pole-mounted equipments were prepared from the point of view making street amenity favourable, and the guide and procedure were clarified to make the suitable design for the street character. 50 design samples of pole-mounted equipments were drafted according to the visual evaluation points of distribution facilities and various design examples of street furniture. To match the equipment design to the street character such as street type on the basis of the application, street width and states of roadside trees, design objectives were classified into three factors such as harmony, amenity creating and symbolization. Visual effects and key words representing design viewpoints were used to make the design appropriate and to concrete the above objectives in the design. Further, five design drafts for street types were prepared and their effects and points to be considered were investigateed. (9 figs, 8 tabs, 13 photos)

36179 **(EPRI-EL—5735) A joint utility investigation of unexplained transmission line outages: Final report.** Beard, S.J.; Wilder, S.E. (eds.); Sandhu, K.S.; Siegel, S.M.; Rash, H.W.; Stearns, R.D.; Baker, D.W.; Roppe, J.A.; Catching, P.W.; Paul, D.R.; Missen, R.J.; Nielson, J.D. (Sierra Pacific Power Corp., Reno, NV (USA); USDOE Bonneville Power Administration, Portland, OR; Pacific Power and Light Co., Portland, OR (USA); Idaho Power Co., Boise (USA)). May 1988. 206p. Research Reports Center, Box 50940, Palo Alto, CA 94303. Order Number TI88010346/JAW.

An investigation into unacceptably high rates of unexplained outages on 345-kV guyed delta transmission lines with V-string insulators in western high desert areas was conducted. The large bird excrement stream theory and the wetted insulator contamination theory were examined to determine what contributions, if any, each had on the unexplained outage rate. Two tower treatments, a bird discourager and extra insulation, were installed on 42 miles of SPPCo transmission line. Unexplained outage data were gathered for 4 years and analyzed to compare the outage performance of untreated, bird discouraged, and extra insulated towers. Extra insulation was found to be an effective treatment for reducing the number of outages. Large birds were inventoried to ascertain the effectiveness of the bird discourager and investigate relationships between bird use and outages on transmission lines. No relationship was found. Local soils, particulate matter in the atomosphere, and contamination on insulators were sampled and analyzed to determine sources of contamination and ESDD levels. Staged tests were performed to evaluate the contamination performance of insulator strings, and weather data were gathered to assess potentials for contamination wetting during the year. A relationship between contamination and outages was identified as probable, but less likely during the hot, dry months of the year. For existing lines in similar environmental areas, 20--25% higher insulation levels are recommended as a means of reducing unexplained outages. For future transmission lines in high desert environments, utilities should consider a more conservatvie approach to line designs, such as increasing insulation levels and providing wider minimum air gap clearances within tower windows. 47 refs., 40 figs., 18 tabs.

36180 **(EPRI-EL—5798-Vol.1) The small signal stability program package: Volume 1, Program package development.** Kundur, P.; Rogers, G.J.; Wong, D.Y. (Ontario Hydro, Toronto (Canada)). May 1988. 178p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010345/JAW.

This report describes the theoretical background of the small signal stability analysis of power systems as embodied in the two programs MASS (multi-area small signal stability) and PEALS (program for eigenvalue analysis of large systems). These programs form, together with a data base program, a Small Signal Stability Package (SSSP) which can be applied to a broad range of stability programs. MASS is a program which forms the state matrix of an interconnected power system and performs an eigenvalue analysis, using the QR technique, on this matrix. PEALS determines, one at a time, those eigenvalues of the power system associated with the rotor angles of the synchronous machines. The basic algorithm used in PEALS was developed under EPRI RP 744-1. However, the modelling and network solution techniques used in PEALS have been newly developed to ensure complete compatibility with MASS and to enable systems having up to 12,000 bus to be studied. In both MASS and PEALS user defined models for excitation systems and dc controls enable the programs to be applied to a wide range of practical power systems. 3 refs., 38 figs.

36181 **(EPRI-EL/EA—5443-Vol.2) Analysis of polychlorinated dibenzofurans and polychlorinated dibenzo-{ital p}-dioxins in transformers and capacitors: Volume 2, Formation of PCDF [polychlorinated dibenzofurans] and PCDD [polychlorinated dibenzo-{ital p}-dioxins] in Askarel and contaminated mineral oil equipment: Final report.** Cooke, W.M.; DeRoos, F.L. (Electric Power Research Inst., Palo Alto, CA (USA)). Mar 1988. 78p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88920261/JAW.

A study was conducted by five independent laboratories to evaluate methods for the measurement of trace levels of polychlorinated dibenzofurans (PCDFs) and polychlorinated dibenzo-p-dioxins (PCDDs) in utility dielectric liquids. Each laboratory evaluated a different analytical method. The method evaluated by Battelle involved spiking with labelled internal standards, analyte enrichment by column chromatography/high resolution mass spectrometry (HRGC/HRMS). Baseline analyses of five dielectric fluids were conducted by each laboratory as an initial test of their methods. The variability of results between the five methods was within expectations, and the five methods were deemed suitable for round robin evaluation. The in-service liquids used in this study were found to have relatively low levels of PCDDs and trace amounts of PCDF. Liquids from transformers with more than 25 years of service had higher PCDF levels than liquids from newer transformers. Liquids from utility appliances exposed to thermal and electrical stresses did not have elevated PCDD or PCDF levels. PCDF levels increased as the Aroclor number (and relative amount of chlorination) increased. 1 fig., 22 tabs.

36182 (IVO-B—04/87) Withstand voltage of slightly polluted insulator chains in humid weather conditions. Aroranta, M.; Lahtinen, M. (Imatran Voima Oy, Helsinki (Finland)). 1987. 59p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752818/JAW.

The aim of this study is to find the probability of flashover for slightly polluted insulator chains at normal working voltage level. The conditions favourable to flashover were examined by varying the atmospheric condition in the test room. The main result of this study is perhaps the verification of the doubt for remarkable flashover probability even at normal working voltage level and in slightly polluted conditions.

36183 (IAEA-TECDOC—431) Low-temperature nuclear heat applications: Nuclear power plants for district heating. Report of an advisory group meeting held in Prague, 23-27 June 1986. (International Atomic Energy Agency, Vienna (Austria)). Aug 1987. 77p. (CONF-8606395—). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88701816/JAW.

From Advisory group meeting on low-temperature nuclear heat applications: nuclear power plants for district heating; Prague, Czechoslovakia (23 Jun 1986).

The IAEA reflected the needs of its Member States for the exchange of information in the field of nuclear heat application already in the late 1970s. In the early 1980s, some Member States showed their interest in the use of heat from electricity producing nuclear power plants and in the development of nuclear heating plants. Accordingly, a technical committee meeting with a workshop was organized in 1983 to review the status of nuclear heat application which confirmed both the progress made in this field and the renewed interest of Member States in an active exchange of information about this subject. In 1985 an Advisory Group summarized the Potential of Low-Temperature Nuclear Heat Application; the relevant Technical Document reviewing the situation in the IAEA's Member States was issued in 1986 (IAEA-TECDOC-397). Programme plans were made for 1986-88 and the IAEA was asked to promote the exchange of information, with specific emphasis on the design criteria, operating experience, safety requirements and specifications for heat-only reactors, co-generation plants and power plants adapted for heat application. Because of a growing interest of the IAEA's Member States about nuclear heat employment in the district heating domaine, an Advisory Group meeting was organized by the IAEA on "Low-Temperature Nuclear Heat Application: Nuclear Power Plants for District Heating" in Prague, Czechoslovakia in June 1986. The information gained up to 1986 and discussed during this meeting is embodied in the present Technical Document. 22 figs, 11 tabs.

36185 (INIS-mf—11153, pp 9-24) 1. Nuclear power - history, the present and prospects. Barabas, K. 1987. (In Czech). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88780081/JAW.

In Nuclear power. CAEC lecturers' manual.

Briefly characterized is the development of nuclear power in the world and in the CSSR. Tables are presented showing the values of the total capacity of nuclear power plants in the individual countries, this of plants in operation and under construction, by 31st December, 1985. Briefly outlined are potential applications of nuclear power in district heating. Two variants are shown of prospective development of installed capacity in the CSSR and of the share of the individual types of power plants till the year 2030. It is envisaged that in that year the nuclear power plant capacity should be about 30,000 MW. (Z.M.).

36186 (NUREG—0020-Vol.12-No.3) Licensed operating reactors: Status summary report: Data as of February 29, 1988. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Administration and Resources Management). Apr 1988. 500p. NTIS, PC A21/MF A01 - GPO;1. Order Number TI88009913/JAW.

The US Nuclear Regulatory Commission's monthly Licensed Operating Reactors Status Summary Report provides data on the operation of nuclear units as timely and accurately as possible. This information is collected by the Office of Information Resources Management, from the Headquarters Staff of NRC's Office of Inspection and Enforcement, from NRC's Regional Offices, and from utilities. This report is divided into three sections: the first contains monthly highlights and statistics for commercial operating units; the second is a compilation of detailed information on each unit, provided by NRC Regional Offices, IE Headquarters and the Utilities; and the third section is an appendix for miscellaneous information such as spent fuel storage capability, reactor years of experience and non-power reactors in the United States.

36187 (NUREG—0020-Vol.12-No.5) Licensed operating reactors: Status summary report data as of 04-30-88. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Administration). May 1988. 505p. NTIS, PC A22/MF A01 - GPO;1. Order Number TI88011371/JAW.

This report is divided into three sections: the first contains monthly highlights and statistics for commercial operating units, and errata from previously reported data; the second is a compilation of detailed information on each unit, provided by NRC Regional Offices, IE Headquarters and the Utilities; and the third section is an appendix for miscellaneous information such as spent fuel storage capability, reactor years of experience and non-power reactors in the United States. The percentage computations, Items 20 through 24 in Section 2, the vendor capacity factors on page 1-7, and actual vs. potential energy production on page 1-2 are computed using actual data for the period of consideration. The percentages listed in power generation on Page 1-2 are computed as an arithmetic average. The factors for the life-span of each unit (the "Cumulative" column) are reported by the utility and are not entirely re-computed by NRC. Utility power production data is checked for consistency with previously submitted statistics. It is hoped this status report proves informative and helpful to all agencies and individuals interested in analyzing trends in the nuclear industry which might have safety implications, or in maintaining an awareness of the US energy situation as a whole.

36188 (NUREG/CR—5038) Optimization of the control of contamination at nuclear power plants. Khan, T.A.; Baum, J.W. (Nuclear Regulatory Commission, Washington, DC (USA); Brookhaven National Lab., Upton, NY (USA)). May 1988. Contract AC02-76CH00016. 145p. NTIS, PC A07/MF A01 - GPO;1. Order Number TI88011800/JAW.

A methodology is described for the optimization of the actions taken to control contamination. It deals with many aspects of contamination, such as the monetary value assigned to a unit of radiation dose, the treatment of skin and extremity dose, and the inefficiencies introduced from working in a contaminated environemnt. The optimization method is illustrated with two case studies based on cleanup projects at nuclear power plants. Guidelines for the use of protective apparel, and for monitoring radiation and contamination at various levels of contamination are presented. The report concludes that additional research is required to quantify the effect of a contaminated environment on work efficiencies.

36189 (EPRI-NP—5775) Environmental effects on components: Commentary for ASME Section 3: Final report. Copeland, J.F. (Electric Power Research Inst., Palo Alto, CA (USA); Structural Integrity Associates, San Jose, CA (USA)). Apr 1988. 76p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009225/JAW.

This report presents general light water reactor experience and guidance summaries for potential service degradation mechanisms not explicitly covered by ASME Section III Code design requirements. Specifically, the damage mechanism description and experience; material selection, treatment and testing; operation and design limitations; and mitigating actions and remedies are summarized for prominent degradation mechanisms based on a review of the literature and industry experience. Emphasis is placed on relatively well-known problem areas based on industry experience, but is not meant to exonerate additional areas of concern which may emerge in the future. This guidance provides summaries and references as starting points for more detailed, case-by-case evaluations of specific applications.

36190 (EPRI-NP—5794) Catalytic methods of deoxygenating water: Final report. Balakrishnan, P.V.; Chuang, K.T.; Fletcher, J.W.; Suppiah, S. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Apr 1988. 92p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009304/JAW.

As part of a programme on the optimization of pressurized water reactor (PWR) secondary side water treatment, methods of reducing the oxygen concentration from the feedwater without the use of toxic chemicals or chemicals that may produce undesirable by-products was sought for. Hydrogen was identified as such a chemical. Gamma radiation and catalysis were studied as means of promoting the reaction between oxygen and hydrogen, to form water with no byproducts. Two types of wet-proofed catalysts—the random bed and the ordered bed catalysts—were developed and tested under two modes of operation—liquid phase and gasliquid phase. Oxygen reduction down to concentrations of 1 ppB or less was achieved. Analytical models were developed for the processes from kinetic studies. Equations for use in designing deoxygenators for steam generator systems were derived. Computer simulations and experimental studies showed that gamma irradiation in the presence of hydrogen reduced oxygen to the low ppB levels at rates corresponding to G({minus}O_2) values in the range 1.5 to 2 molecules100 eV gamma energy absorbed. The gamma source strength required for reducing oxygen concentrations to acceptable levels was estimated. The location of the deoxygenator in a steam generator system is discussed. 41 refs., 21 figs., 11 tabs.

36191 (EUR—11206) Technical status of the supersara project at its termination. Markovina, A.; Randles, J. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1987. 128p. NTIS (US Sales Only), PC A07/MF A01. Order Number DE88753956/JAW.

On March 10th 1983 the Council of Ministers of the European Community adopted the decision to abandon the SuperSARA project. In the frame of this decision, the Management of the SuperSARA project formulated the guidelines to close the project, which included the preparation of the present final report. This report presents the final status of the project, which means that it reflects the situation in March 1983, with a few updates introduced shortly afterwards in conformity with the safety requirements which were being revised at that time. The aim of this report is to give a general description of activities which were carried on to implement the experimental programme and to illustrate some important achievements reached in specific areas. In addition, it is also intended to provide the access key to the documentation which was produced in the past years, so as to make the most significant technical material easily available for any possible future use.

36192 (FEI—1723) Technique for calculating changes in isotope composition using simultaneous iterations of neutron flux and concentration. Glebov, A.P.; Kalashnikov, A.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1985. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88701964/JAW.

Technique for calculating changes in the isotope composition is described. Regular itterations of neutron flux are simultaneously used to refine concentrations of burnable isotopes during every compain moment. Efficiency of the technique is shown using as an example the results of one-dimensional calculations of cylindrical uranium-water cell with gadolinium burnable poison in the centre. 7 refs.

From 1. meeting of the international working group on advanced technologies for water cooled reactors; Vienna, Austria (18 May 1987).

Present PWRs lead to a significant reduction of electricity cost when compared to other sources. Then it seems reasonable to keep the main features of PWRs when looking for improvements of investment cost, of operating and fuel costs, of flexibility and of safety. Besides that we have to think about uranium conservation; if nuclear starts again in many countries, as we hope, the uranium

market could get into a crisis during the first half of the 21st century, and uranium shortage could become a reality. Advanced PWRs are also aimed at fissile material saving. The three French partners CEA, EdF and FRAMATOME decided to lead a three year programme 1984-1987. FRAMATOME in fact had started a little bit earlier, namely in 1982 (first publication in RNG - a French technical journal) and developed the RCVS, spectral shift convertible reactor core (for both Uranium and Plutonium fuel). FRAMATOME's effort is estimated to about 40.10^6 FF per year. EdF, R and D Division, is associated with this feasibility study. CEA performs an R and D programme, the objectives of which are: to support FRAMATOME for RCVS design; to explore a wider range of parameters in order to estimate the feasibility and the interest of tight lattice PWR cores. Simultaneouly, EdF is defining the preliminary specifications of "REP 2000" (future standard for French PWRs in the year 2000 and following); the objectives of REP 2000 are: load follow capacity; cost effectiveness; operation flexibility. FRAMATOME's RCVS and the CEA RSM feasibility study have to be considered in this context. The main objectives are: 1) To improve performances, safety and to minimise cost; 2) To save fissile materials according to a global strategy; 3) While minimum modifications of present PWR components will be accepted. The R and D budget for PWRs (outside safety) of French CEA is around 450 10^6FF per year.

36200 (NUREG/CR—4219-Vol.4-No.2) **Heavy-section steel technology program semiannual progress report for April-September 1987.** Corwin, W.R. (Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OR21400. 335p. (ORNL/TM—9593-Vol.4-No.2). NTIS, PC A15/MF A01;1. Order Number TI88008884/JAW.

The Heavy-Section Steel Technology (HSST) Program is conducted for the Nuclear Regulatory Commission (NCR). The studies relate to all areas of the technology of materials fabricated into thick-section primary-coolant containment systems of light-water-cooled nuclear power reactors. The focus is on the behavior and structural integrity of steel pressure vessels containing cracklike flaws. The program is organized into 12 tasks: (1) program management, (2) fracture methodology and analysis, (3) material characterization and properties, (4) environmentally assisted crack-growth studies, (5) crack-arrest technology, (6) irradiation effects studies, (7) cladding evaluations, (8) intermediate vessel tests and analysis, (9) thermal-shock technology, (10) pressurized thermal-shock (PTS) technology, (11) Pressure Vessel Research Users' Facility (PVRUF), and (12) shipping cask material evaluations. During this period, extensions were made to fracture-analysis codes, including the addition of more constitutive models and inelastic fracture criteria in the dynamic viscoplastic fracture version of the ADINA - ORMGEN-ORVIRT analysis codes at Oak Ridge National Laboratory (ORNL). Elastodynamic analyses and development work on viscoplastic fracture-analysis techniques were performed by ORNL and the Southwest Research Institute (SwRI) in support of the wideplate crack-arrest tests that are being performed by the National Bureau of Standards (NBS) for the HSST Program.

36201 (NUREG/CR—5082) **Simulation experiments on two-phase natural circulation in a freon-113 flow visualization loop.** Lee, Sang Yong; Ishii, Mamoru. (Argonne National Lab., IL (USA)). Jan 1988. Contract W-31109-ENG-38. 54p. (ANL—88-1). NTIS, PC A04/MF A01 - GPO;1. Order Number TI88010402/JAW.

In order to study the two-phase natural circulaton and flow termination during a small break loss of coolant accident in LWR, simulation experiments have been performed using a Freon-113 flow visualization loop. The main focus of the present experiment was placed on the two-phase flow behavior in the hot-leg U-bend typical of B and W LWR systems. The loop was built based on the two-phase flow scaling criteria developed under this program to find out the effect of fluid properties, phase changes and coupling between hydrodynamic and heat transfer phenomena. Significantly different flow behaviors have been observed due to the non-equilibrium phase change phenomena such as the flashing and condensation on the Freon loop in comparison with the previous adiabatic experiment. The phenomena created much more unstable hydrodynamic conditions which lead to cyclic or oscillatory flow behaviors. Also, the void distribution and primary loop flow rate were measured in detail in addition to the important key paramaters, such as the power input, loop friction and the liquid level inside the simulated steam generator.

36202 (STUDSVIK/NF(P)—87/28) **Study of fission products and uranium oxide phases in a defective BWR fuel rod. Final report.** Jonsson, T. (Studsvik Energiteknik AB, Nykoeping (Sweden)). 15 Jul 1987. 23p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753591/JAW.

A defect rod from Ringhals 1 has been examined. The loss of cesium is 15-30% and locally at a cladding defect more than 60% of the inventory. These results are in good agreement with an earlier examination of a defect rod from the same fuel lot. The results also confirm earlier experience of large axial variation of the behaviour of cesium in a defect rod. In the study of various phases in the fuel, emphasis has been placed on optical studies, since radiation background from the sample together with delayed delivery of certain components for the microscope prevented satisfactory quantitative analysis by SEM. Beta autoradiography with an absorber seems to offer a promising method to study the Sr-90 distribution in fuel with a long decay time. It indicates a strontium loss of the same order of magnitude as for cesium. In an outer rim of the uranium dioxide close to a defect there is a differing phase which probably is a uranium oxide with higher oxygen content than UO_2.

2102 Power Reactors, Non-breeding, Light-water Moderated, Non-boiling Water Cooled

REFER ALSO TO CITATION(S) 35809, 36189, 36191, 36192, 36193, 36194, 36195, 36196, 36197, 36198, 36200, 36201, 36283, 36291, 36301, 36331, 36332, 36352, 36353, 36354, 36356, 36370, 36373, 36388, 36390, 36391, 36393, 36394, 36399, 36403, 36404, 36405, 36406, 36407, 36408, 36409, 36410, 36411, 36412, 36413, 36414, 36415, 36423, 36424, 36426, 36427, 36428, 36429, 36430, 36433, 36435, 36436, 36443, 36448, 36450, 36773, 37030

36203 (CEA-CONF—9238) **Dynamic response of PWR vessel during a blowdown.** Guilbaud, D. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 6p. (CONF-870850—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753460/JAW.

From Seminar on extreme load design of future nuclear plant facilities; Paris, France (24 Aug 1987).

This paper presents a study of the behaviour of a 1300 PWR structures during the acoustical period of a blowdown accident, caused by a sudden break of the cold pipe at the outlet of the pump. The calculation gives displacements and pressures for many

points of the vessel. Besides it gives the reaction forces in internal supports and also the loading level reached in the support device of the vessel. This calculation was performed by the computer code TRISTANA, which uses a substructuration method on a modal basis. This simplified method reduces computing size and time for tridimensional problems involving fluid structure interaction and sometimes localized non-linearities. It has already been validated during the calculation of the HDR blowdown.

36204 **(CEA-CONF—9259) Mixed oxides fuels. Adaptation of PWR core and vessel to the mixed oxides fuels. The physical aspect in the conception of the plutonium assemblies.** Martin Deidier L.; Darraud, A.; Bergeron, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 15p. (In French). (CONF-8710325—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753465/JAW.

From SFEN/BNS meeting - technical session on nuclear fuel cycle; Paris, France (7 Oct 1987).

The use of mixed plutonium oxyde fuels (Mox) does not create a prejudice on the performances, manoeuvrability and flexibility of the reactor operation. In this paper, the authors recall the neutronic differences between the plutonium and the uranium and indicate the realized experiences made for qualifying the Mox fuel.

36205 **(CEA-CONF—9260) Malfunction tests and vibration analysis of P.W.R. internal structures.** Puyal, C.; Castello, M.; Dumortier P.; Carre, J.C.; Epstein, A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 8p. (CONF-871013—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753466/JAW.

From 5. SMORN: international conference on reactor noise; Munich, F.R. Germany (12 Oct 1987).

To diagnose changes liable to occur in the vibration behavior of internals, it is important to understand the influence of changes in the mechanical properties of elements on the output signals obtained from neutron chambers placed out of core and accelerometers fixed to the reactor vessel. To do this, the effects of changes liable to occur in the hold-down springs and the flexures were simulated on the SAFRAN loop, using a representative hydroelastic mock-up. The results obtained experimentally on SAFRAN for different characteristics of the hold-down spring, which lies between the upper part of the core barrel and the vessel head, have been published. In this paper, we propose to present the results of the investigation of the fracture of one or more flexures which connect the cylindrical thermal shield to the core barrel. This work is in two parts: a) Computation based on a hydroelastic model using the substructuration computer program TRISTANA of the CASTEM system. b) Tests simulating flexure fracture: 1 - in air, for an understanding of the mechanisms involved; 2 - on the SAFRAN loop with a representative flow in order to estimate the strains liable to exist on the vibration signatures recorded on displacement transducers and accelerometers. Good agreement was observed between the computation results with the theoretical model employed and those obtained experimentally.

36206 **(CEA-CONF—9261) Analytical modal diffusion theory based on flux separability.** Segev, M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 6p. (CONF-871101—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753467/JAW.

From California State Air Resources Board; Los Angeles, CA, USA (15 Nov 1987).

The theory provides for an iterative solution of the mathematical problem of generating the assembly-wise power distribution in a LWR through the solution of the 2-group, multidimensional, diffusion equation. The companion problems of assembly pre-homogenization and of pin power reconstruction are of no direct concern presently. The theoretical development stems from the assumption of flux separability in X, Y and Z. The assumption derives from the notion that separability holds in a great part of the interior of a LWR assembly. More important, well accurate power maps are generated with a code based on the theoretical develpment yielded by the basic assumption.

36207 **(EPRI-CS—5662) Condenser performance test and replacement tubing material evaluation: Final report.** Bell, R.J.; Hardy, C.D. (Heat Exchanger Systems, Inc., Boston, MA (USA)). Apr 1988. 164p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009450/JAW.

This document describes the experiences of a utility in evaluating condenser performance and in performing testing to identify and correct performance deficiencies and related problems. A comprehensive evaluation of the steam surface condenser performance at Kewaunee Nuclear Plant (KNP) was undertaken by Wisconsin Public Service Corporation (WPSC) in the first half of 1984. This evaluation was prompted by the projected need to retube the steam surface condenser. Stainless steel alloys were considered the only acceptable replacement candidates because of the contribution of copper to nuclear plant steam generator corrosion. All of the stainless steel alloys have lower heat transfer coefficients than the Admiralty brass tubing originally installed in the condenser. The potential impact on the unit heat rate coupled with apparent condenser performance deficiences led to this extensive analysis.

36208 **(EPRI-NP—5540) Experimental determination of turbulent buffeting effects in tube bundles: Final report.** Johnson, J.E.; Simonis, J.C. (Electric Power Research Inst., Palo Alto, CA (USA)). May 1988. 160p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010998/JAW.

Dynamic lift and drag force correlations for the first and second row of tubes of a square pitch tube array (P/D=1.44) are presented for upstream turbulence intensity and integral scale lengths. These correlations were developed from experimental testing of full scale heat exchanger tubes in water under controlled and measured turbulent flow conditions. Turbulent buffeting effects for upstream turbulence intensities up to 15% and scale lengths of {1/2} to 1 tube diameter are discussed.

36209 **(EPRI-NP—5555) Prediction of localized flow velocities and turbulence in a PWR steam generator: Final report.** Stuhmiller, J.H. (Electric Power Research Inst., Palo Alto, CA (USA); JAYCOR, San Diego, CA (USA). Engineering Services Group). May 1988. 176p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011529/JAW.

The Steam Generator Project Office (SGPO) of the Steam Generator Owners Group and Electric Power Research Institute has developed a methodology for prediction of steam generator tube buffeting and associated material wear. Turbulent buffeting of steam generator tubes causes low amplitude vibratory response which results in fretting wear at support locations. Concerns raised at the Zion Nuclear Power Plant regarding the useful life of their steam generators prompted this study, in which the SGPO methodology is applied to analysis of the Westinghouse Model 51 steam generator. The specific intent of this project was to calculate turbulent buffeting forces within the tube bank of an operating Model 51 steam generator as a first step in the overall SGPO tube vibration and wear prediction strategy. Attention is focused on flow in the vicinity of anti-vibration bars (U-bend region) and on the flow that leaves the downcomer to impact against peripheral tubes. Other projects utilized the buffeting forces calculated here to determine tube vibratory response, tube-support plate impact statistics, and material wear rates. Besides successfully calculating hydraulic buffeting loads within the tube bank, the present project has enhanced the SGPO methodology and has identified hitherto unnoticed flow phenomena that occur in the steam generator. Experiments have also been carried out to validate numerical computations of the steam generator flow field.

36210 **(EPRI-NP—5556) Numerical prediction of turbulence-induced steam generator tube vibration: Final report.** Stuhmiller, J.H. (Electric Power Research Inst., Palo Alto, CA (USA); JAYCOR, San Diego, CA (USA)). May 1988. 250p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011365/JAW.

This project investigates promising techniques for predicting turbulent buffeting of tubes leading to tube damage from wear

given overall steam generator geometry and operating conditions. The specified overall steam generator operating conditions are used in a model for the steam generator inlet region to evaluate local measures of incoming turbulent flow such as velocity, pressure, turbulence intensity and spectra. A range of models differing in degree of completeness may be used to calculate the incoming flow turbulence. The simplest of the three models is to use a thermal-hydraulic code such as EPRI's ATHOS or PORTHOS code to calculate the steady state flow field (u, v, w and p). Crude, empirical estimates for turbulence intensities and spectra may be deduced from the steady flow results. The best approach, which is chosen for the present study, is Large Eddy Simulation (LES) which gives detailed transient flow results that are in essence a complete description of incoming turbulence. LES results for turbulent flow in the steam generator inlet region provide the necessary local flow conditions for input into tube structural dynamic simulations. This project uses transient thermal-hydraulic analysis of flow within the tube bank to determine the instantaneous, circumferentially integrated force on each tube as a function of position along its axis. The resulting force component time histories provide a complete description of the force imposed on a rigid tube due to the incoming flow turbulence. Tube motion under the action of flow induced forces is determined from models of structural dynamics. This project models one-dimensional motion of the multispan tube including finite tube support clearances and the resulting tube-support impact force. 25 refs., 99 figs., 11 tabs.

36211 **(EPRI-NP—5712) Oxide-film compositions and morphology on Alloy 600 tubes from steam generators: North Anna Unit 1 and Point Beach Unit 1: Final report.** Lumsden, J.B. (Rockwell International Corp., Thousand Oaks, CA (USA)). Apr 1988. 47p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009222/JAW.

Films on alloy 600 steam generator tubing with IGA were characterized to assess the environmental conditions in which the films were formed and thus the environmental conditions which may have caused the IGA. Tubing was analyzed which was from a tube support crevice in the North Anna-1 steam generator. The film composition suggested that the environment at both the outside surface of the tube in the crevice and in the crack was in the range from mildly acidic to mildly alkaline. Boron was also observed in the cracks, indicating that the boric acid injected into the secondary water penetrated into the tube support crevice. The film on the outside surface of a tube removed from the tubesheet crevice of the retired Peach Bottom-1 steam generator suggested either a mildly alkaline solution or a thin liquid film surrounded by steam. The film compositions observed in the cracks of the alloy 600 tubing from Point Beach-1 indicated a caustic solution which increased in caustic concentration from the crack opening to the crack tip.

36212 **(EPRI-NP—5773) Signal processing for steam generator inspection: Interim report.** Jackson, P.S.; Endter, R.K.; Sapia, M.A.; Lareau, J.P. (Combustion Engineering, Inc., Windsor, CT (USA)). Apr 1988. 35p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010311/JAW.

Nuclear power plants have experienced forced outstages because flaws were missed in the manual analysis of eddy current data. This has motivated the need for an automated signal processing technique that can provide increased detection reliability while streamlining the analysis. This research program focuses on optimizing the detection algorithms. Future work will concentrate on classifying the signals deemed relevant. A comparsion of various signal detection schemes has been carried out with the emphasis on conservatively calling flaws without excessive overcalling. Favorable results have been achieved using instantaneous derivatives of amplitude and phase for signal features and distinguishing flaws from non-flaws using the Fisher Linear Discriminant method.

36213 **(EPRI-NP—5812) Modeling Babcock and Wilcox steam generators during auxiliary feedwater injection: Final report.** Wallis, G.B.; Soliman, H.M.; Kuo, J.T. (Electric Power Research Inst., Palo Alto, CA (USA); Dartmouth Coll., Hanover, NH (USA). Thayer School of Engineering). Apr 1988. 98p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010997/JAW.

The performance of B&W once-through steam generators during elevated feedwater injection is governed by several fluid flow and heat transfer phenomena. Among the most significant of these phenomena are the primary flow distribution, flooding at the tube support plates, water distribution in the injection region and redistribution at the tube support plates, and heat transfer in the wetted region. All these phenomena were analyzed, either by applying the results of earlier investigations, or by developing new models when the specific situation of interest was not studied before. Results of the present analyses compared reasonably well in magnitude and trend with the experimental results of GERDA and SAIC tests. Based on these successful comparisons it is concluded that the present analytical models describe the fluid mechanics and heat transfer phenomena sufficiently well for use in the prediction and interpretation of experimental results in the MIST program.

36214 **(EPRI-NP—5865) Feature-enhanced-imaging field trials: Peach Bottom Unit 3.** Selby, G.; Williams, R.; Shankar, R. (Electric Power Research Inst., Palo Alto, CA (USA); Jones (J.A.) Applied Research Co., Charlotte, NC (USA)). Jun 1988. 97p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011772/JAW.

Feature-based systems that combine imaging and signal analysis capabilities may be useful for nondestructive evaluation (NDE) of plant components. This report describes the field evaluation of an integrated system at a plant site during a scheduled outage for pipe weld examination to discriminate intergranular stress corrosion cracking (IGSCC) from benign, geometrical reflectors. The integrated system consisted of a personal computer (PC)-based system capable of detailed analysis of ultrasonic signal data and an in-service inspection (ISI) imaging system used in many commercial pipe examinations for IGSCC. The integrated system was trained to discriminate automatically IGSCC from other reflectors using EPRI NDE Center's inventory of field-removed samples. The methods and results of this training are described. Several classifiers were synthesized using mathematical features derived from signals that were collected to simulate field conditions. Data collection procedures were developed that require minimal operator training. Field data were collected and anlayzed before pipe decontamination prior to pipe replacement. Automatic decision maps were generated for easier data interpretation. The field trial was conducted in October-November 1987. Future activities (January-March 1988) will include collecting additional data after pipe decontamination and after pipe removal to compare changes in baseline. These results will be presented in subsequent reports.

36215 **(EUR—11023) Behaviour of the nozzle corner region during the first phase of the fatigue test on scaled models of pressure vessels (JRC Vessel A).** Jovanovic, A.; Lucia, A.C.; Brunnhuber, R.; Elbaz, J.M.; Schwarz, U. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1987. 98p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753949/JAW.

The work presented here deals mainly with the stress and fracture mechanics aspects of the first phase of the structural reliability experimental program based on the scaled experimental vessel at Ispra. The overall research and experiments make also part of the structural reliability assessment extrapolation pattern for the full-scale structures. The work presented here deals with the problem of the nozzle corner cracks induced by the fatigue under the pressure cycling.

36216 **(EUR—11054) CCF-RBE common cause failure reliability benchmark exercise.** Poucet, A.; Amendola, A.; Cacciabue, P.C. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1987. 129p. NTIS (US Sales Only), PC A07/MF A01. Order Number DE88753950/JAW.

This report summarizes results, obtained by the participants in the Reliability Benchmark Exercise on Common Cause Failures (CCF-RBE). The reference power plant of the CCF-RBE was the NPP at Grohnde (KWG): it is a 1300 MW PWR plant of KWU design and operated by the utility Preussen Elektra. The systems studied were the Start-up and Shut-down system (RR/RL) and the

Emergency Feedwater System (RS) both systems that can feed water into the steam generators in the emergency power mode. The CCF-RBE was organized in two phases: 1. The first phase: during which all participants have performed an analysis on the complete system as defined by the assumed boundaries, i.e. the Start-up and Shut-down system (RR/RL) and the Emergency Feedwater System (RS). 2. The second phase: in which the scope was limited to the RS system. This limitation in scope was agreed upon in the discussion on the results of the first phase, which showed that, within the boundaries of the exercise, RR/RL and RS systems could be considered independent of each other. This report gives an overview of the works carried out, the results obtained and the conclusions and lessons that could be drawn from the CCF-RBE.

36217 **(FRNC-TH—3231) Study of thermal - hydraulic sensors signal fluctuations in PWR.** Hennion, F. (Grenoble-1 Univ., 38 (France); Institut National Polytechnique, 38 - Grenoble (France)). Oct 1987. 207p. (In French). NTIS (US Sales Only), PC A10/MF A01. Order Number DE88753967/JAW.

This thesis deals with signal fluctuations of thermal-hydraulic sensors in the main coolant primary of a pressurized water reactor. The aim of this work is to give a first response about the potentiality of use of these noise signals for the functionning monitoring. Two aspects have been studied: - the modelisation of temperature fluctuations of core thermocouples, by a Monte-Carlo method, gives the main characteristics of these signals and their domain of application. - the determination of eigenfrequency in the primary by an acoustic representation could permit the monitoring of local and global thermo-hydraulic conditions.

36218 **(INIS-BR—968) Fatigue of welded joint in a stainless steel AISI 304 L.** Kuromoto, N.K.; Guimaraes, A.S.; Miranda, P.E.V. de; Pascual, R. (Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro). 1986. 16p. (In Portuguese). (CONF-8610317—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701622/JAW.

From 4. Brazilian symposium on piping and pressure vessels; Salvador, BA, Brazil (28 Oct 1986).

The flexion fatigue behavior for the base metal and welded joint of an AISI 304 L stainless steel type, used in the Angra-1 reactor, was determined. An automatic welding process was used with improved procedures in order to assure better welding metallurgy. Fatigue tests samples reinforcements were done to allow the evaluation of metallurgical variables, specially the role played by delta ferrite. The resulting welded joint showed better fatigue life than the base metal. Delta ferrite was found to play an important role on the initiation and propagation processes of the fatigue cracks.

36219 (INIS-mf—11153, pp 24-29) **2. Nuclear safety of nuclear power plants.** Kriz, Z. 1987. (In Czech). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88780081/JAW.

In Nuclear power. CAEC lecturers' manual.

Nuclear safety is defined in Czechoslovak regulations as the condition and capability of nuclear installations and their operators of preventing uncontrolled development of fission chain reaction and release of radioactive material and of ionizing radiation in the environment. From this point of view, two basic principles are described of securing nuclear safety in the installation project design, namely, the so-called in-depth protection comprising the prevention, control and localization of failures and accidents, and a system of subsequent physical barriers against radioactive material propagation. The role of siting, securing the quality of installations, and of operating personnel of nuclear power plants is briefly characterized with respect to nuclear safety. State inspection bodies whose task and operations are briefly described are the guarantors of the observance of the safety requirements. (Z.M.).

36220 **(INIS-mf—11230) Nuclear power constructions. Feasibility study and project design in the process of nuclear power plant construction.** Chalus, Z.; Kripner, V.; Petrak, P.; Cihlar, M.; Riha, S. (Ceskoslovenska Komise pro Atomovou Energii, Prague; Ceskoslovenska Komise pro Atomovou Energii, Zbraslav nad Vltavou. Ustredni Informacni Stredisko pro Jaderny Program; ORGREZ, Prague (Czechoslovakia); Vyzkumny Ustav Pozemnich Staveb, Prague (Czechoslovakia); Kovoprojekta, Prague (Czechoslovakia)). (Ceskoslovenska Komise pro Atomovou Energii, Prague). 1987. 234p. (In Czech). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702878/JAW.

The feasibility study and the project design and their role in the process of nuclear power plant construction are analyzed in detail. From the point of view of systems aspects of scientific management, the nuclear power plant is considered to be an element of the power generation and transmission system as well as an intersection of capital investment, scientific and technical development and project designing. Foreign experience is summed up with the planning, designing and building of nuclear power plants. Attention is centred to the feasibility study and project design stages of nuclear power plant construction in the CSSR. The questions are discussed of capital investment, territorial planning activities, preproject and project documentation; a survey is presented of legislative provisions involving the project design and capital investment spheres. Briefly outlined are topics for further rationalization of feasibility studies, such as standardization and complex project designs of WWER type nuclear power plants, the introduction of data processing in capital investment provision of WWER type nuclear power plants, and international scientific and technical cooperation including the establishment of a international consultancy centre for the designing and methodology of controlling the building, repairs, reconstruction and the decommissioning of WWER type nuclear power plants. (Z.M.). 81 figs., 2 tabs., 12 refs.

36225 (NUREG/CR—5013) Fatigue life characterization of smooth and notched piping steel specimens in 288{degree}C air environments. Terrell, J.B. (Materials Engineering Associates, Inc., Lanham, MD (USA)). May 1988. 64p. (MEA—2232). NTIS, PC A05/MF A01 - GPO;1. Order Number TI88010175/JAW.

Fatigue strain-life tests were conducted on ASME SA 106-B piping steel at 24{degree}C (76{degree}F) and at PWR operating temperature, 288{degree}C (550{degree}F), under completely reversed loading. Smooth specimens were tested at both temperatures whereas specimens containing notches of various acuities were tested at 288{degree}C. Fatigue limits at 10^7 cycles were estimated to be 185 MPa (26.8 ksi) at 24{degree}C and 232 MPa (33.7 ksi) at 288{degree}C. The difference in fatigue strength observed at the PWR temperature is postulated to be due to dynamic strain aging processes. However, there is a reduction in low cycle fatigue strength at this temperature which results in a decrease in the intended safety factor of the ASME Section III design curve for carbon steels. Notch strain histories were estimated for the notched specimen tests using various interpretations of Neuber's rule. It was concluded that the use of the fatigue notch concentration factor (K/sub f/) in the Neuber relation in conjunction with the uniaxial cyclic stress-strain curve provided the best correlation of notched specimen fatigue data with results obtained from smooth specimen tests. The notched specimen strain-life results derived from the application of Neuber's rule alone proved to be conservative when compared to smooth specimen test results to such an extent that Neuber-generated notch stress and strain amplitudes cannot be compared to the ASME Section III fatigue curves for carbon steels.

36226 (NUREG/CR—5020) A summary of environmentally assisted crack-growth studies performed at Westinghouse Electric Corporation: Under funding from the Heavy-Section Steel Technology Program. Bamford, W.H. (Westinghouse Electric Corp., Pittsburgh (USA). Generation Technology Systems Div.). May 1988. Contract AC05-84OR21400. 245p. (ORNL/Sub—82-21598/1). NTIS, PC A12/MF A01 - GPO;1. Order Number TI88010793/JAW.

This report was prepared as an attempt to collect the information developed in the crack-growth studies at Westinghouse from 1969 to 1986. Although progress reports were issued regularly over the entire period, the program results have not previously been integrated in a single document. The effect of a pressurized-water environment in the enhancement of fatigue crack growth at low frequencies of loading was discovered by Kondo in 1971 and verified in this program shortly thereafter. To characterize plates and forgings, as well as welds and heat-affected zones, a very large number of tests were done in the program. These tests were carried out in a series of matrices structured to investigate various issues, and the results are collected in this report. This work provided a data base for development of ASME Code reference crack-growth curves, as well as insights into some of the mechanisms of environmental enhancement. Static-load crack-growth-rate tests were conducted in the program with some specimens loaded in excess of 11 years. Static-load crack growth was observed in the heat-affected zone specimens and in one base metal heat after several years of exposure.

36227 (SCSIN-REP—5-1-B-82) Meteorological instrumentation. (Ministere de l'Industrie et de la Recherche, 75 - Paris (France). Service Central de Surete des Installations Nucleaires). Jun 1982. 12p. (SIN—E-2745-82). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752580/JAW.

RFS or "Regles Fondamentales de Surete" (Basic Safety Rules) applicable to certain types of nuclear facilities lay down requirements with which compliance, for the type of facilities and within the scope of application covered by the RFS, is considered to be equivalent to compliance with technical French regulatory practice. The object of the RFS is to take advantage of standardization in the field of safety , while allowing for technical progress in that field. They are designed to enable the operating utility and contractors to know the rules pertaining to various subjects which are considered to be acceptable by the "Service Central de Surete des Installations Nucleaires" or the SCSIN (Central Department for the Safety of Nuclear Facilities). These RFS should make safety analysis easier and lead to better understanding between experts and individuals concerned with the problems of nuclear safety. The SCSIN reserves the right to modify, when considered necessary any RFS and specify, if need be, the terms under which a modification is deemed retroactive. The purpose of this RFS is to specify the meteorological instrumentation required at the site of each nuclear power plant equipped with at least one pressurized water reactor.

36228 (CONF-880506—13) The passive safety characteristics of modular high temperature gas-cooled reactor fuel elements. Goodin, D.T.; Kania, M.J.; Nabielek, H.; Schenk, W.; Verfondern, K. (General Atomics Co., San Diego, CA (USA); Oak Ridge National Lab., TN (USA); Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)). 1988. Contract AC05-84OR21400. 6p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010132/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

High-Temperature Gas-Cooled Reactors (HTGR) in both the US and West Germany use an all-ceramic, coated fuel particle to retain fission products. Data from irradiation, postirradiation examinations and postirradiation heating experiments are used to study the performance capabilities of the fuel particles. The experimental results from fission product release tests with HTGR fuel are discussed. These data are used for development of predictive fuel performance models for purposes of design, licensing, and risk analyses. During off normal events, where temperatures may reach up to 1600{degree}C, the data show that no significant radionuclide releases from the fuel will occur.

36229 (CONF-880702—9) Status of international HTGR [high-temperature gas-cooled reactor] development. Homan, F.J.; Simon, W.A. (Oak Ridge National Lab., TN (USA); General Atomics Co., San Diego, CA (USA)). 1988. Contract AC05-84OR21400. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010447/JAW.

From 23. intersociety energy conversion engineering conference; Denver, CO, USA (31 Jul 1988).

Programs for the development of high-temperature gas-cooled reactor (HTGR) technology over the past 30 years in eight countries are briefly described. These programs have included both government sector and industrial participation. The programs have produced four electricity-producing prototype/demonstration reactors, two in the United States, and two in the Federal Republic of Germany. Key design parameters for these reactors are compared with the design parameters planned for follow-on commercial-scale HTGRs. The development of HTGR technology has been enhanced by numerous cooperative agreements over the years, involving both government-sponsored national laboratories and industrial participants. Current bilateral cooperative agreements are described. A relatively new component in the HTGR international cooperation is that of multinational industrial alliances focused on supplying commercial-scale HTGR power plants. Current industrial cooperative agreements are briefly discussed.

36230 (CONF-880702—10) MHTGR [Modular High-Temperature Gas-Cooled Reactor] technology development plan. Homan, F.J.; Neylan, A.J. (Oak Ridge National Lab., TN (USA); General Atomics Co., San Diego, CA (USA)). 1988. Contract AC05-84OR21400. 6p. (CONF-880702—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010445/JAW.

From 23. intersociety energy conversion engineering conference; Denver, CO, USA (31 Jul 1988).

This paper presents the approach used to define the technology program needed to support design and licensing of a Modular High-Temperature Gas-Cooled Reactor (MHTGR). The MHTGR

design depends heavily on data and information developed during the past 25 years to support large HTGR (LHTGR) designs. The technology program focuses on MHTGR-specific operating and accident conditions, and on validation of models and assumptions developed using LHTGR data. The technology program is briefly outlined, and a schedule is presented for completion of technology work which is consistent with completion of a Final Safety Summary Analysis Report (FSSAR) by 1992.

36231 **(IAEA-TECDOC—436) Gas-cooled reactors and their applications. Proceedings of a technical committee meeting held in Juelich, 20-23 October 1986.** (International Atomic Energy Agency, Vienna (Austria)). Oct 1987. 547p. (CONF-8610160—). NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW.

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The purpose of the meeting was to review and discuss the current status and recent progress made in the technology and design of gas-cooled reactors and their application for electricity generation, process steam and process heat production. The meeting was attended by more than 200 participants from 25 countries and International Organizations presenting 34 papers. The technical part of the meeting was subdivided into 7 sessions: A. Overview of the Status of Gas-Cooled Reactors and Their Prospects (2 papers); B. Experience with Gas-Cooled Reactors (5 papers); C. Description of Current GCR Plant Designs (10 papers); D. Safety Aspects (4 papers); E. Gas-Cooled Reactor Applications (3 papers); F. Gas-Cooled Reactor Technology (6 papers); G. User's Perspectives on Gas-Cooled Reactors (4 papers). At the end of the meeting a round table discussion was organized in order to summarize the meeting and to make recommendations for future activities. A separate abstract was prepared for each of the 34 presentations of this meeting. Refs, figs and tabs.

36232 (IAEA-TECDOC—436, pp 11-27) **Magnox reactors and advanced gas-cooled reactors.** Pexton, A.F. (South of Scotland Electricity Board, Glasgow (UK)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

Commercial nuclear power in the U.K. is based on CO_2 cooled graphite moderated reactors. The first seven stations have steel pressure vessels with external boilers connected by gas ducts. The last two have an integrated design with core, boilers and gas circulators enclosed in pre-stressed concrete pressure vessels. The magnox reactors have given good service and the older stations are now being subjected to careful review after 20 years operation. Magnox was superseded by the AGR and five twin reactor stations to three separate and distinct designs, but all with integral gas circuits inside concrete pressure vessels, were ordered in the period 1965 to 1970. The most successful of these, at Hinkley Point 'B' and Hunterston 'B' have now been in operation for over 10 years. Their load factor for the past few years has been of the order of 80%. In 1979 two further twin reactor AGR stations, Heysham II and Tornes, were authorised. These were based on the HinkleyHunterston design with detailed improvements arising from operating experience and developments in safety standards. Commissioning tests are now well advanced and the first reactors at each station are scheduled to come into operation in 1987. Work has proceeded close to the original programme and budget. The Heysham IITorness design now provides a standard base for on-going development of the AGR. A study is in hand which essentially replicates the main features, but by effective use of margins enables higher output to be achieved. The future depends on government policy following issue of the report of the inquiry into CEGB's application to build a PWR at Sizewell, as well as on the political environment following Chernobyl. Whatever the outcome, however, the AGR provides an attractive option with many inherently favourable safety characteristics. Whilst it is difficult to see an incentive for the U.K. to change to an alternative form of gas-cooled reactor technology, U.K. (Abstract Truncated)

36233 (IAEA-TECDOC—436, pp 29-39) **High temperature gas-cooled reactors.** Schulten, R. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The historical development in energy technology has the goal of realizing high temperatures and high efficiencies for the energy conversion processes. The high temperature reactor (HTR) realizes this goal in the best way compared to other reactor types; it uses ceramic materials and helium as the heat transfer media. The development of the fuel elements on the basis of coated particles is considered to be finished. Future applications are the production of electricity and the production of process heat for other areas of the energy market. Originally the thorium/uranium fuel cycle has been envisaged, today the low enriched uranium fuel cycle is of interest, because of the low prices of uranium. Typical for the HTR is its flexibility with respect to different concepts. On the basis of the existing prototypes AVR, THTR-300 and Forth St. Vrain the following two development lines are in discussion: reactors of small unit size and reactors of medium unit size. The safety qualities have been demonstrated by the operation of the AVR reactor in Juelich, which is now in operation for 19 years. These experiences will be of great importance for future plants. The paper outlines the design of a new AGR based on the Heysham II/Torness reactors which are nearing completion of their construction stage. The intent is to replicate as far as possible the Heysham II/Torness design in meeting the target station generator output of 1526 MW(e), and this can be achieved by design changes only to the HP steam pipework. Two additional design options, a vented containment and a dry refuelling route, are also under consideration. (author). 1 fig., 1 tab.

36235 (IAEA-TECDOC—436, pp 53-59) **Technical evolution and operation of French CO_2 cooled reactors (UNGG).** Berthion, Y. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The technical evolution of the five French CO_2 cooled reactors (UNGG) from 1981 to 1986 needs to be outlined. These technical evolutions concerned the fuel element of Bugey 1 which is now slightly enriched, as well as the load reduction operation required by the grid. In addition work is underway to increase the safety at the two St Laurent units, or to repair the hot steel upper-structures of Chinon-3 unit. (author). 4 figs, 4 tabs.

36236 (IAEA-TECDOC—436, pp 61-69) **Fort St. Vrain performance.** Brey, H.L. (Public Service Co. of Colorado, Denver (USA)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

Fort St. Vrain, on the system of Public Service Company of Colorado, is the only high temperature gas-cooled power reactor in the United States. This plant was designed by General Atomic Company and utilizes helium as the primary coolant. The core consists of triso-coated uranium and thorium fuel particles cast into cylinical rods within prismatic graphite blocks. The primary coolant system consists of the reactor, twelve steam generator modules, and four helium circulators contained within a prestressed concrete reactor vessel. The once-through steam generators provide high quality 1,000 deg. F, 2,400 psi main steam and 1,000 deg. F reheat

steam to the main turbine. The plant has generated 3,334,000 MWH of electricity and has undergone 3 reactor refuelings. Many of the primary system components at Fort St. Vrain are proto-typical in nature and this plant has undergone an extensive and elaborate testing program. Difficulties primarily with the helium circulators and fuel element column movements particularly at high power levels have resulted in significant modifications. Power operation at 100% was achieved in late 1981 with a net thermal efficiency of nearly 39%. Excellent performance of the coated fuel particles has contributed to a full power circulating activity sixty times lower than the design with subsequent cleanliness throughout the plant. Except for 1985, when a combined total radiological exposure for all personnel reached 35 manrem due to the necessity to completely refurbish all of the control rod drive mechanisms, the average total combined exposure for each of the past five years was under 3 manrem. This exemplary radiological cleanliness has, with the exception of tritium, allowed Fort St. Vrain to consistently operate with noble gas airborne and liquid effluent releases more than an order of magnitude lower than the average for the U.S. nuclear power industry. The MHTGR is an advanced reactor concept being developed in the USA under a cooperative program involving the US Government, the nuclear industry and the utilities. The design utilizes basic HTGR features of ceramic fuel, helium coolant and a graphite moderator. However the specific size and configuration is selected to utilize the inherently safe characteristics associated with these standard features coupled with passive safety systems to provide a significantly higher margin of safety and investment protection than current generation reactors. Evacuation or sheltering of the public is not required. The major components of the nuclear steam supply, with special emphasis on the core, are described. Safety assessments of the concept are discussed.

In Japan, the very high-temperature reactor (VHTR) for a nuclear process heat application has been developed by Japan Atomic Energy Research Institute (JAERI) since 1969. Looking back upon the activities, there are considerably accumulated technologies enough to construct the experimental VHTR. Recently, however, economic structure in Japan has been changed with the low growth rate of economy and the nation's energy demands have been relieved so rapidly that the needs for nuclear process heat application have been declined. This trend also has been accelerated by introducing firmly the energy-saving technologies in industry and with increasing of the electric power generation by light water reactors. In this situation, the Special Committee of Japan Atomic Energy Commission (JAEC) has recognized newly the significance of the VHTR development from the viewpoint of long future and has recommended the construction of a high-temperature engineering test reactor (HTTR) to upgrade the current VHTR technologies. JAERI has started new deployment of the HTTR as a research facility to prepare for the realization of nuclear process heat application in the 21st century. This paper deals with technical background and the current design concept of the HTTR. (author). 3 figs, 3 tabs.

36244 (IAEA-TECDOC—436, pp 165-177) **Plant design of a high temperature engineering test reactor in JAERI.** Baba, O. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

The Special Committee on HTGR Research and Development Program submitted an interim report after serious discussion

which recommended that a high temperature engineering test reactor (HTTR in this report) should be built to make possible irradiation tests not only for HTGR fuel but also for various materials in high temperature. The required functions to HTTR and its basic design condition are described together with selecting progress. A preliminary design of a high temperature testing reactor, which makes possible HTGR fuel irradiation tests and demonstration tests of HTGR inherent safety, has been done and the results are also explained. (author). 1 ref., 7 figs, 2 tabs.

Based on the demand for a technically clear, safe and economic reactor system, the KWU Group consistently used the extensive know-how obtained from German light water reactor technology and successful operation of the AVR for development of the HTR-Module. With its operating and safety features and its flexible application possibilities, this reactor concept fulfills current market demands to a substantial extent. (author). 10 figs.

36246 (IAEA-TECDOC—436, pp 199-212) **Small nuclear power plants: 10 MW GHR gas-cooled heating reactor.** Schmitt, H. (Hochtemperatur-Reaktorbau G.m.b.H., Mannheim (Germany, F.R.)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The GHR is a simple, safe and economic heating reactor that is designed on the basis of the proven technology of the Gas-Cooled High-Temperature Reactor. The main benefits derive directly from the favourable technical and safety related HTR-characteristics. These are: low radiation exposure; high inherent safety, even in the event of hypothetical accidents; few active systems. The HRB/BBC-design of the GHR makes a wide use of developed and proven HTR components, such as: proven fuel elements containing coated particles for an extremely favourable fission product retention; helium as a coolant and ceramic structures that insure stability of the structures under all conditions; components manufactured for AVR and THTR and tested up to service life loads. The reactor pressure vessel, the intermediate circuit, the control room and all safety related systems are located underground which provides protection against all external impacts, sabotage etc. The remaining overground building is of small, conventional design and only houses auxiliary systems. The whole nuclear heat generating system (primary system) is integrated into a prestressed concrete reactor pressure vessel. It is composed of the core, the absorber rods, a circulator and a heat exchanger to transfer the heat via the intermediate circuit to the consumer circuit. The reactor control philosophy, the decay heat removal systems and the fission product retention barriers follow HTR-principles, which as a whole characterizes the GHR heating plant by the following features: simply operating; passive safety; less maintenance and operating effort; very low radiation exposure; fuel elements for long operating periods; low energy generating costs; shop prefabrication; short construction period. (author). 8 figs.

36247 (IAEA-TECDOC—436, pp 235-250) **HTR 500: The basic design for commercial HTR power stations.** Baust, E.; Schoening, J. (Hochtemperatur-Reaktorbau G.m.b.H., Mannheim (Germany, F.R.)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

With the completion of the THTR 300 and the development of the THTR follow-on plant HTR 500, BBC/HRB have taken the pebble bed high-temperature reactor to the threshold of commercialization. The THTR 300 is the reference plant for the entire high-temperature reactor line in the power range between 100 and 600 MW. In addition, the experience is available which has been acquired with the successful 19 years operation of the 15 MW AVR in Juelich, also constructed by BBC/HRB. As a next step of market penetration in the Federal Republic of Germany the construction of the HTR 500 is intended, a power station for electricity generation and the possibility to extract process heat and district heat. The power size of 550 MW takes account of the modified demand on the nuclear power plant market which for reasons of grid size, financing expenses and the lower increase in electricity demand internationally shows a trend towards smaller power units in the range between 400-600 MW. For special applications in industry (cogeneration of steam and electric power) and for special siting conditions (near industrial centers) the small 100 MW HTR has been developed which can also be constructed as a 200 MW twin-plant under economic conditions, competitive with conventional power plants of the same size without involving the problem of air pollution. After the Chernobyl reactor disaster the high inherent safety of the HTR has been under discussion with increased emphasis. In the present situation characterized by sensitive attitude toward nuclear energy, the HTR with its high safety potential offers favourable conditions regarding its acceptance by the public and politicians. The HTR is a decisive innovation in the field of reactor technology which represents an important contribution to the intermediate and long-term supply of safe, environmental and economic energy to the entire electricity and heat market. 36250 (IAEA-TECDOC—436, pp 283-294) **MHTGR licensing approach and plant response to off normal events.** Neylan, A.J.; Silady, F.A. (GA Technologies, Inc., San Diego, CA (USA)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The MHTGR design meets stringent top-level regulatory and user safety requirements that require that the normal and off-normal operation of the plant not disturb the public's day-to-day activities. Quantitative, generic top-level regulatory criteria have been specified from US NRC and EPA sources to guide the design. The user has further specified that these be met at the plant boundary. A probabilistic risk assessment has been utilized to select licensing basis events that cover a wide spectrum of events. The events have been grouped into three frequency regimes governed by the 10CFR50 App. I, 10CFR100, and PAG risk and dose criteria. The MHTGR fuel has been designed to limit the primary circuit activities to levels that, even if completely released, are within those allowed by 10CFR100. The focus of the safety approach has then been centered on retaining the radionuclide inventory within the

fuel by removing core heat, controlling chemical attack, and by controlling heat generation. The core geometry, core power, core power density, heat removal geometry, and heat sinks are designed to provide passive core temperatures during accidents. To limit the potential for chemical attack of the MHTGR core, the primary coolant boundary is designed to make large ingress of air and water very unlikely. Furthermore, the fuel particle coatings are highly impervious to oxidizing agents that do enter the primary coolant. The core heat generation is controlled by the large negative temperature coefficient and by insertion of control material to maintain a subcritical core configuration during the span of the accidents. Thus, the three key safety functions have been accomplished by relying on the inherent characteristics of the MHTGR so that the response is largely passive and relatively simple. (author). 4 refs, 5 figs, 1 tab.

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

High Temperature Gas Cooled Reactors (HTGR) for the generation of electricity are at present only operated in the United States of America (USA) and the Federal Republic of Germany (FRG). Major development work is also evident in the High Temperature Reactor sector in these countries. Aspects of licensing practice in the USA and the FRG are therefore dealt with to give you possible impetus for the procedure to be adopted in countries where the HTGR technology will be introduced. The design criteria and the technical codes must be supplemented with regard to the requirements of High Temperature Gas Cooled Reactors. Moves in this direction and experience in the application of the relevant codes to High Temperature Gas Cooled Reactors, codes which are mostly oriented to Light Water Reactors (LWR), are to be found in the USA and the FRG in conduct of HTGR licensing procedures. Some criteria have to be applied in an analogous manner. The analogous application of criteria for HTGRs depends on the HTGR-design and refers mainly to the criterion for testability with respect to periodic inspections and tests, the criteria for shutdown systems, residual heat removal systems, reactor coolant boundary and the reactor containment. The IAEA standard "Design for Safety of Nuclear Power Plants, A Code of Practice" is applicable to HTGRs without major difficulties. (author). 11 refs, 1 fig.

36252 (IAEA-TECDOC—436, pp 313-328) **HTGR applications, prospectives and future development.** Barnert, H. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The high temperature reactor (HTR) is an advanced reactor concept: it is "unrestrictedly safe against catastrophes", can be used for electricity production and process heat applications and is economically attractive. It offers a broad variety of possible applications in the future energy market. The next step in the development is the systems demonstration, e.g. with AVR-extension. (author). 10 refs, 14 figs.

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

A High Temperature Gas-Cooled Reactor (HTGR) can solve the problems in improving the economy and broadening the field of utilizing nuclear energy while maintaining safety, due to its specific characteristics of high temperature heat, inherent safety, and high burn-up. Considering the importance to use nuclear energy in non-electric fields in the future, this paper presents a recent study on the perspective of the HTGR in the chemical and iron and steel industries of Japan, conducted by the Japan Atomic Industrial Forum. Although the heat generated by the HTGR will be expensive for use by the chemical and iron and steel industries in the rest of the 20th century, the chemical industry has many good processes which can apply nuclear heat when the cost is competitive compared with fossile fuels. Among them, the process for hydrogen production could be considered for major application. The iron and steel industry has a big potential for use of reducing gas produced by nuclear heat with sufficiently competitive cost. (author). 6 refs, 1 fig., 4 tabs.

36254 (IAEA-TECDOC—436, pp 343-368) **Israeli perspective on HTGRs.** Barak, A.; Beck, A.; Greenspan, E.; Szabo, J.; Blumenau, L.; Branover, H.; El-Boher, A.; Spero, E.; Sukoriansky, S. (Israel Atomic Energy Commission, Tel Aviv; Ben-Gurion Univ. of the Negev, Beersheba (Israel)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

A preliminary assessment of the interest Israel should have in the HTGR technology, and of possibilities for improving the efficiency of HTGRs using the Liquid Metal MHD (LMMHD) energy conversion technology is undertaken. Modular HTGRs were found to offer a collection of features which make them attractive in the Israeli conditions. These features include inherent safety, resistance against acts of war, investment protection, suitability to the Israeli seismic conditions and to dry cooling, possibility for optimal development of the Israeli grid and, hopefully, for economical sea-water desalination and oil-shale utilization. Being free of rotating machinery and being applicable over the entire temperature range of HTGR energy delivery, the LMMHD technology opens new promising possibilities for utilizing the high temperature operation - ability of HTGRs for the production of electricity. A number of novel LMMHD cycles were conceived and attractive matches to the unique HTGR heat source characteristics were identified; they enable producing electricity with efficiencies which exceed 70% of the ideal efficiencies even in the very high temperature domain. For example, the LMMHD technology might enable attaining net efficiencies of 43% and 47% in, respectively, the first and second generation of HTGRs as compared with efficiencies of 37% to 40% attainable with conventional steam energy conversion technology. (author). 17 refs, 5 figs, 2 tabs.

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The Base Technology Development Program for the Modular High Temperature Gas Cooled Reactor (MHTGR) provides basic information on fuel performance, fission product retention capabilities, and material properties; the program plan for obtaining such information is summarized, considering the specific needs of the MHTGR concept. Continued international cooperation in HTGR base technology development will contribute to the planned program. (author). 13 figs.

36256 (IAEA-TECDOC—436, pp 387-405) **Status and development of the German materials programme for the HTGR.** Nickel, H.; Schubert, F.; Schuster, H. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorwerkstoffe). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

During the last decade the research and development of materials for the HTGR in Germany have mainly been directed to-

wards the qualification of high temperature structural alloys for heat transferring components of advanced nuclear process heat plants. The availability of Fe/Ni-base and Ni-base alloys for long term service loading has in principle been established. Furthermore, materials and optimization have indicated that improvements in the corrosion properties are also achievable. The status of the material evaluation and optimization are demonstrated with NiCr 22 Co 12 Mo (Alloy 617) and Thermon 4972 for heat exchanging components, with the steel DIN Werkstoff-Nr. 1.4981 (X 8 CrNiMoNb 16 16) for absorber and control rods and carbon fibre reinforced carbon (CFC) for hot ducting. The continuing HTR structural materials programme is aimed at improving the quality and data base of the materials for components of advanced HTGR's, both for nuclear heat application and for the steam cycle. Emphasis is given: to the determination of long term design values for different semi-finished products including weldments; to improve service life estimation rules; to improve constitutive equations for inelastic analysis and to develop design rules; to develop fracture mechanics criteria for leak - before - break argumentations. The general aim of this work is to assure the long term integrity of class I components. Using typical examples, this paper shows the status of the theoretical and experimental work related to these objectives. (author). 25 refs, 16 figs.

(INTERATOM), Bergisch Gladbach (Germany, F.R.)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The High Temperature Helium Test Facility which started operation in August 1982 has reached an operating time of 11,000 hrs. It serves in testing components of high-temperature gas-cooled reactors for direct heat application and for the steam cycle HTR-Module. Tests of a 10 MW U-tube heat exchanger, the cylindrical hot header of the He-heat exchangers, and a secondary hot gas duct have been successfully completed. Operation will be continued with tests of a 10 MW helical-tube heat exchanger, a 10 MW steam generator and primary and secondary hot gas duct test objects like bends and a coaxial duct. The availability of the test facility is better than 80%. (author). 20 figs.

36258 (IAEA-TECDOC—436, pp 429-443) **HTR fuel development and qualification: Treatment of spent fuel.** Kaiser, G.; Hackstein, K. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.); Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The paper gives a description of design and performance requirements for spherical HTGR fuel elements together with the fabrication technology and the irradiation qualification. Different options for spent fuel treatment are presented and discussed. (author). 19 refs, 8 figs, 3 tabs.

36259 (IAEA-TECDOC—436, pp 445-460) **Characteristics of HTGR spherical fuel elements.** Chernikov, A.S.; Permyakov, L.N.; Mikhajlichenko, L.I.; Kurbakov, S.D. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The paper presents the investigation results for the basic characteristics of spherical fuel element components: fuel microspheres (dimension, shape, density, structure, strength), pyrocarbon and silicon carbide coatings (thickness, density, macro- and microstructure, crystalline structure, thermal stability, gaseous fission product release, radiation stability etc.) and matrix graphite (density, effective thermal conductivity, linear thermal expansion coefficient, elasticity modulus, bending strength). In manufacturing fuel microspheres sol-gel process and slip-casting methods were used; coating deposition was accomplished in fluidized bed, high-density pyrocarbon coatings being deposited from CH_4-Ar or C_3H_6-Ar; SiC coatings - from CH_4-$SiCl_4$-H_2-Ar or CH_3SiCl_3-H_2-Ar mixtures; matrix graphite was prepared on the basis of bulk graphite fillers, 30 PG and MPG-6. (author). 13 refs, 8 figs, 3 tabs.

36260 (IAEA-TECDOC—436, pp 461-469) **Self-sustaining thorium cycle in a high temperature graphite reactor.** Balakrishnan, K. (Bhabha Atomic Research Centre, Bombay (India)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The paper contains results of studies for optimizing fuel utilization in HTGRs. Different U235 enrichments, core power densities and heavy metal concepts have been analyzed and results are presented and discussed. (author). 1 ref., 3 figs.

36261 (IAEA-TECDOC—436, pp 473-482) **Future applications of the high temperature reactor.** Klusmann, A.; Stelzer, M. (Ruhrkohle Oel und Gas GmbH, Bottrop (Germany, F.R.)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The advanced reactor systems, the fast breeder and the high temperature reactor (HTR), have reached maturity for commercial use. At the same time nuclear energy is in a critical situation. In addition to reliability, safety, and competitiveness new requirements have come up for future projects in many countries. More safety, an easy fuel cycle, a wide variety of process applications, public acceptance and low environmental impacts are demanded by the public. The HTR can fulfil most of these criteria as is proven by the German prototype plants 15 MW AVR-Juelich and 300 MW THTR Schmehausen. The Federal Republic of Germany can contribute to the future use of nuclear energy a new safe reactor system with application possibilities beyond the electric power production. (author). 15 refs.

36262 **(UCRL—98235) Chernobyl source term, atmospheric dispersion, and dose estimation.** Gudiksen, P.H.; Harvey, T.F.; Lange, R. (Lawrence Livermore National Lab., CA (USA)). Feb 1988. Contract W-7405-ENG-48. 17p. (CONF-880367—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008886/JAW.

From SCOPE-ENUWAR workshop on the environmental consequences of nuclear war; Moscow, USSR (20 Mar 1988).

The Chernobyl source term available for long-range transport was estimated by integration of radiological measurements with atmospheric dispersion modeling, and by reactor core radionuclide inventory estimation in conjunction with WASH-1400 release fractions associated with specific chemical groups. These analyses indicated that essentially all of the noble gases, 80% of the radioiodines, 40% of the radiocesium, 10% of the tellurium, and about 1% or less of the more refractory elements were released. Atmospheric dispersion modeling of the radioactive cloud over the Northern Hemisphere revealed that the cloud became segmented during the first day, with the lower section heading toward Scandinavia and the uppper part heading in a southeasterly direction with subsequent transport across Asia to Japan, the North Pacific, and the west coast of North America. The inhalation doses due to direct cloud exposure were estimated to exceed 10 mGy near the Chernobyl area, to range between 0.1 and 0.001 mGy within most of Europe, and to be generally less than 0.00001 mGy within the US. The Chernobyl source term was several orders of magnitude greater than those associated with the Windscale and TMI reactor accidents, while the ^{137}Cs from the Chernobyl event is about 6% of that released by the US and USSR atmospheric nuclear weapon tests. 9 refs., 3 figs., 6 tabs.

From 1. non destructive testing congress for Latin America and Caribbean; Sao Paulo, Brazil (21 Sep 1986).

The Channel Inspection and Gauging Apparatus of Reactors (CIGAR) is a fully atomated, remotely operated inspection system designed to perform multi-channel, multi-task inspection of CANDU reactor fuel channels. Ultrasonic techniques are used for flaw detection, (with a sensitivity capable of detecting a 0.075 mm deep notch with a signal to noise ratio of 10 dB) and pressure tube wall thickness and diameter measurements. Eddy currrent systems are used to detect the presence of spacers between the coaxial pressure tube and calandria tube, as well as to measure their relative spacing. A servo-accelerometer is used to estimate the sag of the fuel channels. This advanced inspection system was commissioned and declared in service in September 1985. The paper describes the inspection systems themselves and discussed the results achieved to-date.

From Seminar on inelastic analysis and life prediction on high temperature environment; Lausanne, Switzerland (24 Aug 1987).

This paper highlights the main items emerging from a large bibliographical survey carried out on strain-induced buckling analysis methods applicable in the building of fast neutron reactor structures. The work is centred on the practical analysis methods used in construction codes to account for the strain-buckling of thin and slender structures. Methods proposed in the literature concerning past and present studies are rapidly described. Experimental, theoretical and numerical methods are considered. Methods applicable to design and their degree of validation are indicated.

36266 (CONF-880417—22) Current experimental activities for solid breeder development. Johnson, C.E.; Hollenberg, G.W.; Roux, N.; Watanabe, H. (Argonne National Lab., IL (USA); Pacific Northwest Lab., Richland, WA (USA); Japan Atomic Energy Research Inst., Tokai, Ibaraki). 1988. Contract W-31-109-ENG-38. 24p. From International symposium on nuclear fusion technology; Tokyo, Japan (10 Apr 1988).

The current data base for ceramic breeder materials does not exhibit any negative features as regards to thermophysical, mechanical, and irradiation behavior. All candidate materials show excellent stability for irradiation testing to 3% burnup. In-situ tritium recovery tests show very low tritium inventories for all candidates. Theoretical models are being developed to accurately predict real time release rates. Fabrication of kilogram quantities of materials has been achieved and technology is available for further scale-up.

36267 (CONF-880506—7) Analyzing unprotected transients in metal fuel cores with the SAS4A accident analysis code. Tentner, A.M.; Birgersson, G.; Hill, D.J.; Kalimullah; Miles, K.J. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 29p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009952/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

In the search for new advanced reactor concepts with enhanced safety and economics, attention is now centered in the US on the development of Liquid Metal-Cooled Reactors (LMR) equipped with a metal fuel core. While metal fuel reactors present significant advantages over oxide fuel reactors during normal operation and protected transients, they also have desirable characteristics during low probability unprotected transients. The consequences of these transients are evaluated using the SAS4A code system[1]. The SAS4A code has been designed to simulate the events that occur in an LMR core during the initiating phase of a hypothetical severe unprotected accident such as the Transient Overpower (TOP) or loss of Flow (LOF) accidents. In order to adapt the SAS4A code to the analysis of metal fuel cores, new models have been developed, reflecting the special characteristics of these cores. This paper describes current SAS4A capabilities and emphasizes the influence of metal fuel characteristics on the whole core behavior during the accident.

36268 (CONF-880506—16) Experimental and analytical studies of passive shutdown heat removal from advanced LMRs [liquid metal reactors]. Pedersen, D.; Heineman, J.; Stewart, R.; Anderson, T.; Lottes, P.; Tessier, J. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 6p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010092/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

A facility designed and constructed to demonstrate the viability of natural convection passive heat removal systems as a key feature of innovative LMR Shutdown Heat Removal (SHR) systems is in operation at Argonne National Laboratory (ANL). This Natural Convection Shutdown Heat Removal Test Facility (NSTF) has investigated the heat transfer performance of the GE/PRISM passive design. This initial series of experiments simulates the air-side geometry of the PRISM Radiant Reactor Vessel Auxiliary Cooling System (RVACS). The NSTF operates in either a uniform heat flux mode and a uniform temperature mode at the air/guard vessel interface. Analysis of the RVACS performance data indicates excellent agreement with pretest analytical predictions. Correlation analysis presents the heat transfer data in a form suitable for use in LMR design and verification of analytical studies.

36269 (CONF-880506—18) Metal fuel safety performance. Miles, K.J. Jr.; Tentner, A.M. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 21p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011998/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

The current development of breeder reactor systems has lead to the renewed interest in metal fuels as the driver material. Modeling efforts were begun to provide a mechanistic description of the metal fuel during anticipated and hypothetical transients within the context of the SAS4A accident analysis code system. Through validation exercises using experimental results of metal fuel TREAT tests, confidence is being developed on the nature and accuracy of the modeling and implementation. Prefailure characterization, transient pin response, margins to failure, axial in-pin fuel relocation prior to cladding breach, and molten fuel relocation after cladding breach are considered. Transient time scales ranging from milliseconds to many hours can be studied with all the reactivity feedbacks evaluated.

36270 (CONF-880546—20) Integral data for fast reactors. Collins, P.J.; Poenitz, W.P.; McFarlane, H.F. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 17p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012039/JAW.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

Requirements at Argonne National Laboratory to establish the best estimates and uncertainties for LMR design parameters have lead to an extensive evaluation of the available critical experiment database. Emphasis has been put upon selection of a wide range of cores, including both benchmark, assemblies covering a range of spectra and compositions and power reactor mock-up assemblies with diverse measured parameters. The integral measurements have been revised, where necessary, using the most recent reference data and a covariance matrix constructed. A sensitivity database has been calculated, embracing all parameters, which enables quantification of the relevance of the integral data to parameters calculated with ENDF/B-V.2 cross sections.

36271 (CONF-880601—34) Centralized Reliability Data Organization (CREDO) assessment of critical component unavailability in liquid metal reactors. Koger, K.H.; Haire, M.J.; Humphrys, B.L.; Manneschmidt, J.F.; Setoguchi, K.; Nakai, R. (Oak Ridge National Lab., TN (USA); Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center; Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). 1988. Contract AC05-84OR21400. 13p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011847/JAW.

From American Nuclear Society annual meeting; San Diego, CA, USA (12 Jun 1988).

The Centralized Reliability Data Organization (CREDO) is the largest repository of liquid metal reactor (LMR) component reliability data in the world. It is jointly sponsored by the US Dept. of Energy (DOE) and the Power Reactor and Nuclear Fuel Development Corporation (PNC) of Japan. The CREDO data base contains information on a population of more than 20,000 components and approximately 1500 event records. A conservative estimation is that the total component operating hours is approaching 2.2 billion hours. The work reported here focuses on the availability information contained in CREDO and the development of availability critical items lists. That is, individual components are ranked in prioritized lists from worst to best performers from an availability standpoint. Availability as used here is an inherent characteristics of the component and is not necessarily related to plant operability. A major observation is that a few components have a much higher unavailability factor than the average. The top fifteen components contribute 93%, 77%, and 87% of the total system unavailability for EBR-II, FFTF, and JOYO respectively. Critical components common to all three sites are mechanical pumps and electromagnetic pumps. Application of resources to these components with the highest unavailability will have the greatest effect on overall availability. All three sites demonstrate that low maintainability (i.e., long repair times), rather than unreliability (i.e., high failure rates), are the main contributors, by about a two-to-one margin, to liquid metal system unavailability.

36272 (CONF-880661—6) Benefits of vertical and horizontal seismic isolation for LMR [liquid metal reactor] nuclear reactor units. Wu, Ting-shu; Chang, Y.W.; Seidensticker, R.W. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009975/JAW.

From ASME pressure vessel and piping conference; Pittsburgh, PA, USA (19 Jun 1988).

Seismic isolation has been shown to be able to reduce transmitted seismic force and lower response accelerations of a structure. When applied to nuclear reactors, it will minimize seismic influence on the reactor design and provide a design which is less site dependent. In liquid metal reactors where components are virtually at atmospheric pressure but under severe thermal conditions, thinwalled structures are generally used for primary systems. Thinwalled structures, however, have little inherent seismic resistance. The concept of seismic isolation therefore offers a viable and effective approach that permits the reactor structures to better withstand thermal and seismic loadings simultaneously. The majority of published work on seismic isolation deals with use of horizontal isolation system only. In this investigation, however, local vertical isolation is also provided for the primary system. Such local vertical isolation is found to result in significant benefits for major massive components, such as the reactor cover, designed to withstand vertical motions and loadings. Preliminary estimations on commodity savings of the primary system show that, with additional local vertical isolation, the savings could be twice that estimated for horizontal isolation only. The degree of effectiveness of vertical isolation depends on the diameter of the reactor vessel. As the reactor vessel diameter increases, the vertical seismic effects become more pronounced and vertical isolation can make a significant contribution.

36273 (EUR—11306) Comparison of the containment codes used in the benchmark exercise from the modelling and numerical treatment point of view. Washby, V. (UKAEA United Kingdom Atomic Energy Authority, Warrington). (Commission of the European Communities, Luxembourg). 1987. 57p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753961/JAW.

This report is the subject of a study contract sponsored by the containment loading and response group (CONT), a sub-group of the safety working group of the fast reactor co-ordinating committee - CEC. The analysises provided here will form part of a final report on containment codes, sensitivity analysis, and benchmark comparison, performed by the group in recent years. The contribution of this study contract is to assess the six different containment codes, used in the benchmark comparison, with regard to their procedures and methods, and also to provide an assessment of their benchmark calculation results, so that an overall assessment of their effectiveness for use in containment problems can be made. Each code description, which has been provided by the relevant user, contains a large amount of detailed information and a large number of equations, which would be unwieldy to reproduce and probably unnecessary. For this reason the report has concentrated on a fuller description of the SEURBNUK code, this being the code most familiar to the author, and other code descriptions have concentrated on noting variations and differences. Also, the code SEURBNUK/EURDYN has been used for the sensitivity analysis, this code being an extension of the original code SEURBNUK with the addition of axi-symmetric finite element capabilities. The six containment codes described and assessed in this report are those which were being actively used within the European community at the time.

36274 (UJV—7939-T) Statistical characteristics of turbulent flow in fast reactor fuel assembly periphery without spacers. Hejna, J.; Smid, J.; Cervenka, J. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Jun 1987. 86p. (In Russian). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702956/JAW.

Method and results are presented of the turbulent flow microstructure measurement in a model of fast reactor fuel assembly periphery without wire wrap and spacers. The results of measurement (at Re=172000) and evaluation in form of normal and shear stresses, turbulent kinetic energy and eddy viscosity are compared

with the data for a circular tube and some literature data. (author). 69 figs., 18 tabs., 20 refs.

36275 **NEPTUNE: A system of finite element programs for three-dimensional nonlinear analysis.** Kulak, R.F.; Fiala, C. (Argonne National Lab., IL (USA). Reactor Analysis and Safety Div.). *Nuclear Engineering and Design;* **106**: No. 1, 47-68(Feb 1988). Contract W-31-109-ENG-38.

This paper describes the NEPTUNE system of finite element codes that is being developed to assist in the design, safety evaluation, and licensing of metal and concrete reactor structures subjected to static or transient mechanical loads. The implementations of (1) a quadrilateral plate element for concrete, (2) a family of interface elements to treat contact and/or impact between structures, and (3) a silent boundary element are highlighted. Terse descriptions of the remaining elements in the code are given. The solution of the static equilibrium equations are obtained with the dynamic relaxation algorithms, and the equations of motion are solved with the central difference algorithm. The wide range of applicability of the code system is demonstrated with four examples. The propagation of a wave through a silent boundary is first illustrated. Then the impact of a deformable cylindrical container against a rigid floor is simulated. The final two problems deal with structural safety evaluations. The transient response of a liquid metal reactor's head assembly is first described, and then, a numerical simulation of the response of a 1/6-scale reinforced concrete light water reactor, containment model to static overpressurization is presented.

36276 **Analysis of primary containment response using an arbitrary Langrangian-Eulerian method.** Wang Chungyi. (Argonne National Lab., IL (USA). Reactor Analysis and Safety Div.). *Nuclear Engineering and Design;* **106**: No. 1, 127-146(Feb 1988). Contract W-31-109-ENG-38.

This paper describes an advanced arbitrary Lagrangian-Eulerian method and its associated computer program, ALICE-II, for calculating the response of liquid metal reactor containment to core energetics. It is a versatile numerical algorithm with more flexibility and efficiency than other methods used to treat reactor containment with complex internals such as internal thin shells, upper internal structures, perforated plates, core-support diagrid, shield baffles, and deflector plates. The algorithm uses a two-dimensional, hybrid Lagrangian-Eulerian finite-difference technique to calculate the hydrodynamics and fluid-structure interactions, together with a purely Eulerian finite-difference approach to analyze the free-surface and material interface motions. It has significant advantages in treating complex phenomena such as flow through perforated structures, large material distortions, multi-dimensional sliding interfaces, flow around corners, highly contorted fluid boundaries, outflow boundary conditions, and coolant spillage. Numerical calculations for the hydrodynamic solutions are separated into three phases. The first phase consists of an explicit Lagrangian calculation. The second phase, which is options, contains an implicit iteration. The third phase, which is also optional, rezones the mesh vertices to prescribed positions. The structural response is computed by a library of elastic-plastic elements formulated in corotational coordinates in conjunction with an explicit time-integration scheme. Interaction between fluid and structure is accounted for by rigorously enforcing the interface boundary conditions. Many sample problems are given to illustrate the code effectiveness. Results demonstrate that these complex fluid-structure interaction problems can be analyzed with the ALICE-II code in a relatively natural and straightforward manner.

36277 **Integral fast reactor shows its mettle.** Chang, Y.I.; Lineberry, M.J.; Burris, L.; Waters, L.C. (Argonne National Lab., IL (USA)). *Nuclear Engineering International;* **32**: No. 400, 23-24, 26(Nov 1987).

Experiments and conceptual design work are progressing in the United States on a metal fuel alternative to the oxide fuel cycle for liquid-metal fast reactors. The fuel cycle is based on high-temperature metal reprocessing and injection-casting fabrication. Feasibility could be demonstrated at low cost in existing facilities. (U.K.).

2106 Power Reactors, Auxiliary, Mobile, Package, And Transportable

36278 **(CONF-880702—2) Heat pump augmented radiator for low-temperature space applications.** Olszewski, M.; Rockenfeller, U. (Oak Ridge National Lab., TN (USA); Rocky Research Corp., Boulder City, NV (USA)). 1988. Contract AC05-84OR21400. 20p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008369/JAW.

From 23. intersociety energy conversion engineering conference; Denver, CO, USA (31 Jul 1988).

Closed-cycle, space-based heat rejection systems depend solely on radiation to achieve their heat dissipation function. Since the payload heat rejection temperature is typically 50 K above that of the radiation sink in near earth orbit, the size and mass of these systems can be appreciable. Size (and potentially mass) reductions are achievable by increasing the rejection temperature via a heat pump. Two heat pump concept were examined to determine if radiator area reductions could be realized without increasing the mass of the heat rejection system. The first was a conventional, electrically-driven vapor compression system. The second is an innovative concept using a solid-vapor adsorption system driven by reject heat from the prime power system. The mass and radiator area of the heat pumpradiator systems were compared to that of a radiator only system to determine the merit of the heat pump concepts. Results for the compressor system indicated that the mass minimum occured at a temperature lift of about 50 K and radiator area reductions of 35% were realized. With a radiator specific mass of 10 kgm^2, the heat pump system is 15% higher than the radiator only baseline system. The complex compound chemisorption systems showed more promising results. Using water vapor as the working fluid in a single stage heat amplifier resulted in optimal temperature lifts exceeding 150 K. This resulted in a radiator area reduction of 83% with a mass reduction of 64%. 7 refs., 9 figs.

36279 **(CONF-880702—5) Transient thermal analysis of three fast-charging latent heat storage configurations for a space-based power system.** Stovall, T.K.; Arimilli, R.V. (Oak Ridge National Lab., TN (USA); Tennessee Univ., Knoxville (USA). Dept. of Mechanical and Aerospace Engineering). 1988. Contract AC05-84OR21400. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88009714/JAW.

From 23. intersociety energy conversion engineering conference; Denver, CO, USA (31 Jul 1988).

A space-based thermal storage application must accept large quantities of heat in a short period of time at an elevated temperature. A model of a lithium hydride phase change energy storage system was used to estimate reasonable physical dimensions for this application which included the use of a liquid metal heat transfer fluid. A finite difference computer code was developed and used to evaluate three methods of enhancing heat transfer in the PCM energy storage system. None of these three methods, inserting thin fins, reticulated nickel, or liquid lithium, significantly improved the system performance. The use of a 95% void fraction reticulated nickel insert was found to increase the storage capacity (total energy stored) of the system slightly with only a small decrease in the system energy density (energy storage/system mass). The addition of 10% liquid lithium was found to cause minor increases in both storage density and storage capacity with the added benefit of reducing the hydrogen pressure of the lithium hydride. 9 refs., 7 figs., 2 tabs.

36280 **Military needs and requirements for multi-megawatt terrestrial power plants.** Atkinson, S.A.; Bowman, A.L. (Idaho National Engineering Lab., Idaho Falls, ID (US)). pp 1585-1590 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—). Contract AC07-76ID01570.

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879336.

Numerous studies and actual electric grid power loss incidents and exercises have demonstrated the critical dependence of Air Force bases and their mission on electric power supply. One

result of the energy security evaluations of the Air Force is a goal to provide for on-base electric power generation. The Air Force requirements and desired attributes for on-base secure power generation have been defined, and a small nuclear power plant is found to have many advantages towards meeting both the requirements and the wants of the Air Force for secure power generation.

36281 **Heat transfer for ultra-high flux reactor.** Wadkins, R.P.; Lake, J.A.; Oh, C.H. (Idaho National Engineering Lab., EG and G Idaho, Inc., Idaho Falls, ID (US)). pp 134 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

The use of a uniquely designed nuclear reactor to supply neutrons for materials research is the focus of recent reactor design efforts. The biological, materials, and fundamental physics aspects of research require neutron fluxes much higher than present research and testing facilities can produce. The most advanced research using neutrons as probing detectors is being done in the High Flux Reactor at the Institut Laue Langeuin, Frnace. The design of a reactor that can produce neutron fluxes of 1.0×10^{16} ncm^2 s requires a relatively high power (300 MW range) and a small core volume (approximately 30 liters). This combination of power and volume leads to a high power density which places increased demands on thermal hydraulic margins.

36282 **(AICE—8008927) The role of nuclear power in the energy future of the United States.** (American Inst. of Chemical Engineers, New York). Apr 1988. 13p. American Institute of Chemical Engineers, 1707 L Street, NW, Suite 333, Washington, DC 20036. Order Number TI88008927/JAW.

Nuclear energy offers a viable means of safely producing economical electric energy while minimizing depletion of US fossil resources and diminishing US reliance on oil and gas imports. However, the once-vigorous and growing US nuclear power industry has lost much of its vitality. Energy needs, environmental concerns, and continued reliance on electricity strongly indicate that nuclear plants should provide an increasing part of our energy supply. Failure to deal positively with the growing energy problems including stagnation of the nuclear power industry threatens the future economic well-being of the United States. To cope with today's state of nuclear stagnation, government and industry must deal with several factors including unstable regulatory requirements and policies, the political problems with the high-level waste disposal program, delays caused by extensive public intervention and litigation, mismanagement of nuclear power plants, and the general fear by the public of all things nuclear. Attempts to preserve nuclear power as a viable option for the future must acknowledge and resolve both institutional and technical issues. The topics discussed in this report and the recommendations therein constitute key steps to revitalize the nuclear option.

36283 **(EPRI-NP—5744) ASME [American Society of Mechanical Engineers] code, Section XI: 1985-1987 revisions and updates: Final report.** Mattu, R.K.; Anderson, W.F. (Science Applications International Corp., McLean, VA (USA)). May 1988. 355p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010645/JAW.

ASME Section XI, {open←quotes}Rules for Inservice Inspection of Nuclear Power Plant Components{close←quotes} provides rules for examination, testing, and inspection of components and systems in a nuclear power plant. New editions of Section XI are issued every 3 years, and Addenda, which include additions and revisions to each Edition of the Code, are published once a year. This report covers ASME Section XI updates (proposed and approved), related NRC activities, information on O and M Standards dealing with pumps and valves, and snubbers and special issues such as personnel qualification and training for the period from June 1985 through June 1987. Summary information is also provided on Utility Inservice Inspection and Inservice Testing (ISI/IST) program results, relief requests, and current issues like plant life extension/plant aging, repair and replacement programs (steam generator, BWR piping, etc.), maintenance programs, performance indicators, check valves, and BOP inspections.

36284 **(IAEA-INSAG-TN—1) Towards improvement in quality assurance. Report by the International Nuclear Safety Advisory Group.** (International Atomic Energy Agency, Vienna (Austria)). Mar 1987. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88701984/JAW.

This first document in the series of the International Nuclear Safety Advisory Group (INSAG) Technical Notes is a general guideline for the establishment of effective quality assurance procedures at nuclear facilities. It sets out primary requirements such as quality objectives, methods for measuring the effectiveness of the quality assurance programme, priority of activities in relation to importance of safety of items, motivation of personnel.

36285 **(NUREG—0040-Vol.12-No.1) Licensee contractor and vendor inspeecxtion status report: Quarterly report, January 1988-March 1988.** (Nuclear Regulatory Commission, Washington, DC (USA)). May 1988. 127p. NTIS, PC A07/MF A01 - GPO;3. Order Number TI88011849/JAW.

This periodical covers the results of inspections performed by the NRC's Vendor Inspection Branch that have been distributed to the inspected organizations during the period from January 1988 through March 1988. Also included in this issue are the results of certain inspections performed prior to January 1988 that were not included in previous issues of NUREG-0040.

36286 **(NUREG—0540-Vol.10-No.3) Title list of documents made publicly available, March 1-31, 1988.** (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Publications Services). May 1988. 385p. NTIS, PC A17 - GPO;3. Order Number TI88010592/JAW.

This document is a monthly publication containing descriptions of information received and generated by the US NRC. This information includes (1) docketed material associated with civilian nuclear power plants and other uses of radioactive materials, and (2) nondocketed material received and generated by NRC pertinent to its role as a regulatory agency. The following indexes are included: Personal Author Index, Corporate Author Index, Report Number Index, and Cross Reference to Principal Documents Index.

36287 **(NUREG—0750-Vol.27-No.2) Nuclear Regulatory Commission issuances, February 1988.** (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Publications Services). Feb 1988. 221p. NTIS, PC A10/MF A01 - GPO;1. Order Number TI88009561/JAW.

This report includes the issuances received during the specified period from the Commission (CLI), the Atomic Safety and Licensing Appeal Boards (ALAB), the Atomic Safety and Licensing Boards (LBP), the Administrative Law Judge (ALJ), the Directors' Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM).

36288 **(NUREG—0750(Vol.27)(No.3)) Nuclear Regulatory Commission issuances, March 1988.** (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Publications Services). Mar 1988. 84p. NTIS, PC A05/MF A01 - GPO;1; GPO Dep. Order Number TI88010236/JAW.

This report includes the issuances received during the specified period from the Commission (CLI), the Atomic Safety and Licensing Appeal Boards (ALAB), the Atomic Safety and Licensing Boards (LBP), the Administrative Law Judge (ALJ), the Directors' Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM).

36289 **(NUREG—1214-Rev.3) Historical data summary of the systematic assessment of licensee performance.** (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Licensee Performance and Quality Evaluation). May 1988. 70p. NTIS, PC A04 - GPO;3. Order Number TI88010249/JAW.

The Historical Data Summary of the Systematic Assessment of Licensee Performance (SALP) is produced periodically by the US Nuclear Regulatory Commission. This summary provides the results of the assessment for each facility by NRC region and is further divided into the following three sections: Section 1 presents the most recent SALP report ratings for facilities under construction and in operation. Section 2 presents a chronological listing of all SALP report ratings for each operating facility. Section 3 presents a chronological listing of all SALP report ratings for each facility under construction. For historical purposes, past construction SALP ratings for facilities that recently have been licensed also are listed in Section 3.

36290 **(SAND—87-7136) US national and regional impacts of nuclear plant life extension.** Makovich, L.; Forest, L.; Fletcher, T. (DRI Energy Service, Lexington, MA (USA); DRI Project and Product Consulting, Washington, DC (USA)). Jan 1988. Contract AC04-76DP00789. 214p. NTIS, PC A10;3. Order Number DE88007317/JAW.

The US will need new sources of electricity in the early 21st century due to retirement of much of the nation's generating capacity. Almost all of the US nuclear capacity would be included in those retirements if, as originally expected, the nuclear units were shut down and decommissioned as the operating licenses expired between 2005 and 2025. However, given the large demands for new capacity during that period, nuclear plant life extension (NUPLEX) – the extension of operating life beyond the original license period – needs to be considered as an electricity source. This study assesses the benefits and costs of NUPLEX relative to the anticipated competing sources of electricity supply in the early 21st century. We find that NUPLEX yields large net benefits under a wide range of plausible economic conditions. This study associates net benefits with electricity cost savings, thereby abstracting from speculative reliability considerations. To illustrate the effects of uncertainty, the study assesses NUPLEX net benefits under varying assumptions on NUPLEX investment costs and other future economic conditions.

36291 **(SAND—88-1416C) Methodology to identify, review, and evaluate components for license renewal.** Carlson, D.D.; Gregor, F.E.; Walker, R.S. (Sandia National Labs., Albuquerque, NM (USA); Multiple Dynamics Corp., Southfield, MI (USA); Grove Engineering, Gaithersburg, MD (USA)). 1988. Contract AC04-76DP00789. 12p. (CONF-880748—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011200/JAW.

From American Nuclear Society topical meeting on nuclear power plant life extension; Snowbird, UT, USA (31 Jul 1988).

A methodology has been developed to systematically identify, review, and evaluate plant equipment for license renewal. The method builds upon the existing licensing basis, operating history, and accepted deterministic and probabilistic techniques. Use of these approaches provides a focus for license renewal upon those safety-significant systems and components that are not routinely replaced, refurbished, or subject to detailed inspection as part of the plant's existing test, maintenance, and surveillance programs. Application of the method identified the PWR and BWR systems that should be subjected to detailed license renewal review. Detailed examination of two example systems demonstrates the approach. The review and evaluation of plant equipment for license renewal differ from the initial licensing of the plant. A substantial operating history has been established, the licensing basis has evolved from the original one, and plant equipment has been subject to periodic maintenance and surveillance throughout its life. In consideration of these differences, a basis for license renewal is needed. License renewal should be based upon continuation of the existing licensing basis and recognition of existing programs and operating history.

36292 (IAEA-TECDOC—436, pp 483-497) **Financing models for HTR plants: Co-financing, counter trade, joint ventures.** Bogen, J.; Stoelzl, D. (Brown, Boveri und Cie A.G., Mannheim (Germany, F.R.)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

Structure and volume of investment cost for HTR nuclear power plants are different in comparison to other types of nuclear power plants. Even if the share of local participation is in comparable order of magnitude to other nuclear power plants, the required technical infrastructure for HTR plants is more suitable for existing and still practised technologies in countries which are in development processes. These HTR specific features offer special possibilities in HTR project financing. Various models are discussed in respect of the special HTR situation. Even if it is not possible to point out in a general manner the best solution - due to national, local and time dependant situations - this paper discusses the HTR specific impacts to buyer's credit financing, supplier's credit financing, barter trades or joint ventures and combined financing. (author). 4 refs, 9 figs.

36293 (IAEA-TECDOC—436, pp 499-509) **Perspectives on the HTGR from utilities in the USA.** Brey, H.L.; Mears, L.D. (Public Service Co. of Colorado, Denver (USA); Gas-Cooled Reactor Associates, San Diego, CA (USA)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

The Gas Cooled Reactor Associates (GCRA) represents utility/user interests within the United States in establishing and achieving HTGR program objectives. GCRA conducts Demonstration Project development activities, plus provides overall program coordination/integration support services to the U.S. Department of Energy. This paper summarizes three of the activities currently being undertaken by GCRA. These include: The 1986 Summary of the United States Utility/User Questionnaires concerning new electrical generating capacity, the future of nuclear power, and the potential of the HTGR; The utility/user requirements for the modular HTGR plant, and An update on the modular HTGR Demonstration Project development activities. (author). 3 refs, 11 figs.

36294 (IAEA-TECDOC—436, pp 511-519) **Market prospects of HTRs in newly industrialized and developing countries.** Garriba, S.; Vivante, C. (Politecnico di Milano (Italy); Commission of the European Communities, Brussels (Belgium)). Oct 1987. NTIS (US Sales Only), PC A23/MF A01. Order Number DE88701817/JAW. (CONF-8610160—).

From IAEA technical committee meeting on gas-cooled reactors and their applications; Juelich, F.R. Germany (20 Oct 1986).

Some unique characteristics seem to make HTR a nuclear system suitable to cope with future power and energy supply needs of a developing world. Aspects which deserve consideration are economics, technological flexibility, safety and proliferation issues. As compared with other nuclear reactor concepts, HTRs can be constructed into relatively small sizes according to a standardized approach. This characteristic renders the reactor suitable to be introduced in power grids of limited extension. The small size allows to increase the installed power generating capacity by following the variable trend of demand, all within a short construction period. The high degree of inherent safety makes the reactor system especially resistant to equipment failures and mismanagement. Safety and high-temperature features would allow the use of the reactor for supplying steam and process heat a newly industrializing country may need. In principle, non-proliferation records of HTRs depend upon the type of nuclear fuel and nuclear fuel cycle. If low-enriched or medium-enriched uranium is used, reprocessing would not be necessary. The exhausted fuel can be easily accommodated

and stored before ultimate disposal. Finally, as for its relation with the local context, HTR entails flexible arrangements, which can be adapted to participation and seem suitable to technology transfer. Given these opportunities, it can be suggested that forms of co-operation with developing countries are looked for to monitor technology progress and prepare appropriate solutions. (author). 8 refs.

36295 **(SAND—88-0084C) State of technology assessment for life extension of electrical and I & C equipment in nuclear power plants.** DuCharme, A.R.; Boger, R.M.; Meyer, L.C.; Beament, P.R. (Sandia National Labs., Albuquerque, NM (USA); Westinghouse Hanford Co., Richland, WA (USA); EG and G Idaho, Inc., Idaho Falls (USA); Virginia Power Co., Richmond (USA)). 1988. Contract AC04-76DP00789. 12p. (CONF-880748—4). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011249/JAW.

From American Nuclear Society topical meeting on nuclear power plant life extension; Snowbird, UT, USA (31 Jul 1988).

As part of the IEEE Working Group 3.4 on Nuclear Plant Life Extension, an assessment is made of the current state of technology for the life extension of certain classes of electrical and I&C equipment. The classes investigated include motors, cables, emergency diesel generators, penetrations, inverters/chargers, switchgear, and reactor protection systems. The work is focussed on assessment of current or recently completed R&D efforts to resolve issues affecting life extension of the equipment. Aspects discussed include the degree of resolution of these issues, potentially affected standards, and technical aspects requiring further research. 15 refs., 2 tabs.

36296 **Construction-man hour estimation for nuclear power plants.** Paek, J.H. Austin, TX; Univ. of Texas (1987). 139p. University Microfilms Order No. 87-17,503.

Thesis (Ph. D.).

This study centers on a statistical analysis of the preliminary construction time, main construction time, and total construction man hours of nuclear power plants. The use of these econometric techniques allows the major man hour driving variables to be identified through multivariate analysis of time-series data on over 80 United States nuclear power plants. The analysis made in this study provides a clearer picture of the dynamic changes that have occurred in the man hours of these plants when compared to engineering estimates of man hours, and produces a tool that can be used to project nuclear power plant man hours.

36297 **(FEI—1720) Three-dimensional schemes in the method of non-total factorization.** Buleev, N.I.; Ledovskij, V.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1985. 17p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701963/JAW.

Three-dimensional schemes for non-total factorization in solving difference equations of the diffusion type are reviewed. The derivation of equations in running coefficients of the scheme with the run according to the third coordinate and with the explicit scheme in a two-dimensional plane of two first coordinates is described in detail. The results of test calculation of the simulating problem with boundary conditions of the first type are given for this scheme. Equations determining running coefficients are given for other schemes, otherwise differences, being possessed in one or another scheme modification, are described. The schemes described permit efficiently to solve difference equations approximating differential elliptical equations of the different type. 12 refs.

36298 **(IAE—4308/4) Constants of delayed neutrons.** Manevich, L.G.; Nemirovskij, P.Eh.; Yudkevich, M.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1986. 36p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701975/JAW.

Experimental data on the probability of neutron emission P/sub n/ during fission fragment decay are evaluated. On the basis of the data on P/sub n/ and fragment yields the yields of delayed neutrons ν/sub d/ per one fission act in the processes of thermal fission of /sup 233,235/U, /sup 239,241/Pu and fission of ^{232}Th, /sup 235,238/U, ^{230}Pu in the fission spectrum range are calculated. With somewhat lower accuracy ν/sub d/ is obtained for /sup 233,236/U, ^{237}Np, /sup 240,241,242/Pu fast fission and ^{232}Th, /sup 233,235,238/U and ^{239}Pu fission by 14-MeV neutrons. Evaluation calculations of ν/sub d/ are made for exotic nuclei ^{229}Th, ^{238}Pu, ^{241}Am, /sup 243,244,245,247/Cm. For the main fission isotopes the time dependence of neutron activity drop after irradiation is calculated. 6-group constants are obtained. All the values obtained are compared with the results of macroscopic measurements. The 6-group constants comparison is made as applied to reactivity measurement using the method of reversed solution of kinetic equation. 27 refs.3 figs.; 14 tabs.

36299 **(IKE—6-172) ICM2D, a program for solving multigroup neutron transport problems in (x,y) geometry applying the J^{+-}-concept with consistent partial current coupling.** Rueckle, T.; Emendoerfer, D. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme). Apr 1987. 40p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753548/JAW.

This program has been developed for fast, two-dimensional transport calculations, on the theoretical basis of the method of consistent partial current coupling. The report explains the method and the characteristics of the ICM2D program. It is suitable to calculating multigroup neutron distributions in fuel elements with homogenized fuel rod cells. Defining the mesh size to be that of the homogenized fuel rod cell, the accuracy of the solution is near the S/sub N/-solution of the order 4. A sub-division of meshes reduces the accuracy. The computing times for solving two-dimensional multigroup transport problems are significantly reduced with the ICM2D program, compared to the S/sub N/-method.

36300 (INIS-SU—10, pp 40-46) **On possibility of vibrational stabilization in nuclear instable stationary regimes in nuclear reactors.** Trakhtenberg, A.M. 1987. (In Russian). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88780094/JAW.

Voprosy Atomnoj Nauki i Tekhniki.; (No. 2).

In Physics and technology of nuclear reactors.

A principle possibility of applying the vibrational stabilization method to nuclear reactors is studied. The problem of securing the stability of nuclear reactor operation steady-state regimes is one of the central ones in dynamics theory and nuclear reaction operation experience. In particular, the problem of xenon oscillation suppressing in a reactor, occuring as a result of steady-state regime instability is urgent. Investigation is conducted using the simpliest reactor model, repesenting it as a non-linear object with concentrated parameters. It is proved that vibrational stabilization is achieved by periodic fluctuations of the control rod positions in the reactor core and boric acid concentration in the coolant with period $1s<T<3x10^4s$. In practice stabilization is effective, when the steady-state regime is located near the stability boundary, which appears to be dangerous, i.e. self-oscillations with inadmissibly high amplitude occure in the reactor.

36301 (AD-A—190258/4/XAB) Design, construction, and testing of an in-pile loop for PWR (Pressurized Water Reactor) simulation. Master's thesis. Wicks, J.H. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Ocean Engineering). Jun 1987. 130p. NTIS, PC A07/MF A01.

Corrosion-product activation and transport in Light Water Reactors is a well-recognized, but poorly understood phenomenon, despite studies conducted worldwide for the past 20 years. In an effort to determine the mechanistic parameters that produce and release the transport activated corrosion products throughout a typical Pressurized Water Reactor (PWR), MIT has undertaken the construction of a model pressurized-water loop to simulate the thermal hydraulic characteristics of a representative full-scale PWR. This report presents the final detailed design of the PCCL. As-built, the loop duplicates the core and steam generator fluid surface film differential temperatures, bulk fluid temperatures, and wall fluid shear stress of an actual PWR. Included are proposed plans for seatrial testing of the initial loop prior to research operation. The final design was reviewed and authorized for construction by the PCCL Project Staff and the MIT Reactor Safeguards Committee.

36302 (CEA-CONF—9234) Sextant: an expert system for transient analysis of nuclear reactors and integral test facilities. Barbet, N.; Dumas, M.; Mihelich, G. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 8p. (CONF-870832—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753456/JAW.

From Topical meeting on artificial intelligence and other innovative computer applications in the nuclear industry; Snowbird, UT, USA (31 Aug 1987).

Expert systems provide a new way of dealing with the computer-aided management of nuclear plants by combining several knowledge bases and reasoning modes together with a set of numerical models for real-time analysis of transients. New development tools are required together with metaknowledge bases handling temporal hypothetical reasoning and planning. They have to be efficient and robust because during a transient, neither measurements nor models, nor scenarios are hold as absolute references. SEXTANT is a general purpose physical analyzer intended to provide a pattern and avoid duplication of general tools and knowledge bases for similar applications. It combines several knowledge bases concerning measurements, models and qualitative behavior of PWR with a mechanism of conjecture-refutation and a set of simplified models matching the current physical state. A prototype is under assessment by dealing with integral test facility transients. For its development, SEXTANT requires a powerful shell. SPIRAL is such a toolkit, oriented towards online analysis of complex processes and already used in several applications.

36303 (CONF-880601—33) TEM [transmission electron microscopy], APFIM [atom-probe field ion microscopy], and SANS [small-angle neutron scattering] examination of aged duplex stainless steel components from some decommissioned reactors. Chung, H.M.; Chopra, O.K. (Argonne National Lab., IL (USA)). Dec 1987. Contract W-31109-ENG-38. 10p. (CONF-880601—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009984/JAW.

From American Nuclear Society annual meeting; San Diego, CA, USA (12 Jun 1988).

The present investigation indicates that the primary embrittlement processes of the CF-8 grade cast stainless steel components during extended reactor service are spinodal decomposition of the ferrite phase and $M_{23}C_6$ carbide precipitation on the austenite-ferrite boundaries. The ferrite hardness measured for the Shippingport reactor valves appears to reflect the different extent of spinodal decomposition among the different valves which contain slightly different Cr contents. G-phase precipitation was minimal compared to that during accelerated aging of CF-8 steel in the laboratory (i.e., near 400{degree}C). This indicates that the activation energy may be strongly influenced by the synergism among the G-phase precipitation, carbide formation, and spinodal decomposition. 13 refs., 2 figs.

36304 (CONF-8805141—2) Crack arrest behavior of reactor pressure vessel steels at high temperatures. Pugh, C.E.; Naus, D.J.; Bass, B.R. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 26p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011833/JAW.

From IAEA specialists' meeting on fracture mechanics verification by large-scale testing; Stuttgart, F.R. Germany (25 May 1988).

The Heavy-Section Steel Technology Program at the Oak Ridge National Laboratory under the sponsorship of the US Nuclear Regulatory Commission is conducting experimental and analytical studies to improve the understanding of conditions that govern the initiation, rapid propagation, arrest and ductile tearing of cracks in reactor pressure vessel (RPV) steels. In support of this objective, large-scale wide-plate experiments are performed to generate crack-arrest toughness data for RPV steels at temperatures approaching and above the onset of Charpy upper-shelf behavior. Analytical studies are addressing the role of dynamics and nonlinear rate-dependent (i.e., viscoplastic) effects in the interpretation of crack run-arrest events in these ductile materials. A summary of the wide-plate tests performed to date is presented, including details of test procedures, test data, and results of analyses performed to date. The importance of incorporating viscoplastic effects into dynamic analysis of crack run-arrest events in these strain-rate sensitive steels is examined through applications of selected proposed viscoplastic constitutive equations and fracture parameters to the interpretation of data from the wide-plate tests. The crack-arrest data are compared with those from small ASTM-type specimens and other large structural tests.

36305 (EPRI-NP—5697) Valve stem packing improvements: Final report. Ruggieri, S.K.; Kelly, J.S. (Electric Power Research Inst., Palo Alto, CA (USA)). May 1988. 387p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011367/JAW.

Valve stem seal leakage has been the direct cause of a significant number of events which resulted in the shutdown of nuclear power plants. It has also been a major contributor to the maintenance effort required in these power plants. The overall objectives of this project were to: identify the root causes of selected events related to improper performance of valve stem seal systems, develop the means to permanently correct the performance deficiencies, evaluate the corrective actions in full-scale laboratory testing and in-plant evaluations, and provide for the technology transfer of the recommended corrective actions. Specific achievements detailed in this report include: the development of valve stem sealing systems that effectively control valve stem leakage, an extensive laboratory evaluation of these improved systems at full scale under simulated plant conditions, an extensive testing program to evaluate both the need for and relative effectiveness of corrosion inhibitors, and installation of the improved valve stem sealing system in an operating plant. The project was conducted in two phases. The activities and results of Phase 1 are published in EPRI Report NP-4255 (February 1986). This final report includes the activities and results of both Phase 1 and Phase 2.

36306 (FEI—1828) Heat and mass transfer in a transport channel. Matyushina, S.A.; Opanasenko, A.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1987. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88701968/JAW.

Heat and mass transfer in transport channels of a fast reactor charging complex is investigated. Results of studying mass transfer and temperature conditions in a model channel 430 mm in diameter and with relative length of 9.3 connecting heated gas (argon) cavity and environment are presented. Mathematical model for calculating fields of temperature and gas velocities with provision for diffusion based on solution of the Navier-Stokes equations in the Helmholtz form is considerd. The data obtained show that at similar conditions mass transfer is characterized with instability; it is proportional in value to a temperature difference between gas cavities. Mount-

ing of a cooling heat exchanger in the upper channel section along its 1/3 length leads to static gaseous lock abruptly decreasing mass transfer. 4 refs.; 4 figs.

36307 **(IAE—4309/4) Technique for probabilistic calculation of brittle fracture of power plant pressure vessels.** Tkachev, V.V.; Tutnov, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1986. 27p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701976/JAW.

Technique for probabilistic calculation of brittle fracture of power plant pressure vessels is presented. Effect of static spread in data on mechanical material properties, defect sizes and errors of nondestructive test means on the accuracy of brittle fracture time prediction is taken account of. Example of probabilistic calculation of nuclear reactor vessel fracture during its operation is given. 6 refs.; 2 figs.

36308 **(INIS-BR—964) Contribution for stress analysis in bend acessories of piping systems.** Melo, F.J.M.Q. de; Castro, P.M.S.T. de. (Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro). 1986. 15p. (In Portuguese). (CONF-8610317—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701618/JAW.

From 4. Brazilian symposium on piping and pressure vessels; Salvador, BA, Brazil (28 Oct 1986).

Analytical and numerical studies of the linear elastic behavior of bend pipes, with tangent pipes or flanged ends, such as used in nuclear power plants are presented. Two analytical techniques were developed; one is based on the integration of Euler equation and the other one is based on a Fourier analysis. The results obtained using these approaches are compared with results obtained by a finite element code for 'semiloof shells.

36309 **(INIS-BR—965) Elastic-plastic analysis of part-through crack propagation in piping and pressure vessels.** Souza, L.A. de; Ebecken, N.F.F. (Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro). 1986. 13p. (In Portuguese). (CONF-8610317—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701619/JAW.

From 4. Brazilian symposium on piping and pressure vessels; Salvador, BA, Brazil (28 Oct 1986).

The shell structures, often used in the construction of reservoirs, pipings, pressure vessels, nuclear power plants, etc, with part-through crack along its thickness, are analysed, using a computer system developed by the finite element method. The surface is discretized with three-dimensional quadratic elements, degenerated in its mid-surface, such the fracture is simulated by scalar elements (non linear springs). The results are analysed by the stress intensity factor K Sub(I) and the strain energy release rate, which is known as J-integral. The analysis is performed in the elastic and elastic-plastic regime. The basic hipothesis and the formulation adopted in the derivation of the scalar elements are also shown.

36310 **(INIS-BR—966) Dynamic analysis of pipings by Modal Synthesis.** Augusto, O.B.; Mattar Neto, M. (Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro). 1986. 13p. (In Portuguese). (CONF-8610317—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701620/JAW.

From 4. Brazilian symposium on piping and pressure vessels; Salvador, BA, Brazil (28 Oct 1986).

A Modal Synthesis method, the component modes, and its implementation as a post-processor of finite element program is presented. Examples of calculations of stationary and transient vibrations for monitoring pipelines of nuclear power plants are analysed. (M.C.K.).

36311 **(INIS-BR—967) Qualification of expansion and welding procedures of tube-to-tubesheet joints for heat exchangers in nuclear power plants.** Camargo, G.D.M.; Couto, J.G.V.; Castro, L.A.S. de. (Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro). 1986. 18p. (In Portuguese). (CONF-8610317—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701621/JAW.

From 4. Brazilian symposium on piping and pressure vessels; Salvador, BA, Brazil (28 Oct 1986).

Leaking tube to tubesheet joints are among the most frequent defects detected in the operation of tubular heat exchangers. This kind of problem requires a special treatment, in the case of heat exchangers intalled in nuclear power plants, aiming at a minimum of leakages and further repair outages. The criteria used for the pre-qualification of tube-to-tubesheet joints, is described, and the experiences acquired during the tests and fabrication of several components supplied by national manufacturers, are presented.

36312 **(INIS-BR—970) Stress in pressurized spheres with imperfections.** Godoy, L.A.; Flores, F.G. (Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro). 1986. 11p. (In Spanish). (CONF-8610317—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701624/JAW.

From 4. Brazilian symposium on piping and pressure vessels; Salvador, BA, Brazil (28 Oct 1986).

Stresses due to geometric imperfections in pressurized thin spherical shells, which are used in containments of nuclear reactors and steam generation systems are studied. The analysis is carried out discretizing the imperfect geometry by finite element method.

36313 **(INIS-BR—971) Seismic analysis of a containment vessel.** Toledo, E.M.; Loula, A.F.D.; Jospin, R.J. (Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro). 1986. 18p. (In Portuguese). (CONF-8610317—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701625/JAW.

From 4. Brazilian symposium on piping and pressure vessels; Salvador, BA, Brazil (28 Oct 1986).

A seismic analysis of a nuclear power plant's steel containment vessel is presented. Visual loads in this kind of analysis like SSE, DBE and SSB loadings are considered. With the response spectra previously obtained, for these loadings, one uses the response spectrum techniques in order to obtain estimatives for the maximum values of the stresses. Some considerations about the problem and the approach used for the solution, are initially described. Next, the analysed structure geometry and some results, compared with those obtained by using ANSYS computer code, is showed.

36314 **(INIS-BR—972) Seismic analysis of structures of nuclear power plants by Lanczos mode superposition method.** Coutinho, A.L.G.A.; Alves, J.L.D.; Landau, L.; Lima, E.C.P. de; Ebecken, N.F.F. (Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro). 1986. 20p. (In Portuguese). (CONF-8610317—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701626/JAW.

From 4. Brazilian symposium on piping and pressure vessels; Salvador, BA, Brazil (28 Oct 1986).

The Lanczos Mode Superposition Method is applied in the seismic analysis of nuclear power plants. The coordinate transformation matrix is generated by the Lanczos algorithm. It is shown that, through a convenient choice of the starting vector of the algorithm, modes with participation factors are automatically selected. It is performed the Response Spectra analysis of a typical reactor building. The obtained results are compared with those determined by the classical aproach stressing the remarkable computer effectiveness of the proposed methodology.

36315 (INIS-mf—11222, pp 46-56) **Dynamic diagnostics of the structure and components of a nuclear power plant during construction and operation.** Juhasova, E. (Slovenska Akademia Vied, Bratislava (Czechoslovakia). Ustav Stavebnictva a Architektury). 1987. (In Slovak). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

The demands are discussed put on the dynamic diagnostics of engineering structures and components of nuclear power plants during their construction and operation. The said measurements are made using field and laboratory tests. Suitable sources of vibration are characterized and the results are described of tests of seismic resistance of ceramic insulators and their steel suports on an elec-

trohydraulically controlled seismic table. It is recommended that during the construction of a nuclear power plant dynamic measurements should be made of structures and components using all available vibration sources and that the main production unit and its key components should be provided with seismometric instruments. (Z.M.). 7 figs., 2 tabs., 12 refs.

36316 **(ITEF—73(1987)) Method of three-dimensional calculation of a heterogeneous reactor in the dipole approximation.** Malofeev, V.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 30p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702097/JAW.

Method of three-dimensional calculation of heterogeneous reactor in the dipole approximation is presented. This method is based on difference transformation of heterogeneous reactor theory equations and on Fourier cine expansion of neutron flux axial constituent. The method is realized in the TRECD program developed on the basis of the monopole TREC program permitting to calculate reactors with the large number of channels. Results of monopole and dipole calculations according to the TRECD program and direct two-dimensional DISHER program illustrating the difference method accuracy are given. 8 refs.

36317 **(NUREG/CR—4932) Close of IE Bulletin 80-03: Loss of charcoal from standard Type 2, two-inch, tray adsorber cells.** Dean, R.S.; Foley, W.J.; Hennick, A. (Parameter, Inc., Elm Grove, WI (USA)). Apr 1988. 26p. (PARAMETER/IE—167). NTIS, PC A03/MF A01 - GPO. Order Number TI88009217/JAW.

IE Bulletin 80-03 was issued on February 6, 1980, because of concern about defective charcoal tray adsorber cells found in certain ventilation systems at the Sequoyah Nuclear Plant. Some charcoal cells are used in special engineered safety feature (ESF) filtration systems. Others are installed in normal ventilation systems to control radioactive materials during expected operations, in compliance with 10 CFR 50 Appendix I. Licensees of operating power reactors were required to take four specific actions. Holders of construction permits for power reactors were required to take two specific actions. A copy of IE Bulletin 80-03 and a synopsis of the required actions are included in Appendix A. Evaluation of utility responses and NRC/Region inspection reports is documented in Appendix B as the basis for bulletin closeout by means of specific criteria (see Page 4 of the report text). A followup item is proposed in Appendix C for use by the NRC in assuring satisfactory completion of corrective action. Abbreviations used in this report and associated documents are presented in Appendix D. 3 refs.

36318 **(NUREG/CR—5159) Prediction of check valve performance and degradation in nuclear power plant systems: Final report, September 1987--April 1988.** Kalsi, M.S.; Horst, C.L.; Wang, J.K. (Kalsi Engineering, Inc., Sugar Land, TX (USA)). May 1988. 76p. (KEI—1559). NTIS, PC A05/MF A01 - GPO. Order Number TI88011557/JAW.

Degradation and failure of swing check valves and resulting damage to plant equipment has led to a need to develop a method to predict performance and degradation of these valves in nuclear power plant systems. This Phase I investigation developed methods which can be used to predict the stability of the check valve disk when piping disturbances such as elbows, reducers, and generalized turbulence sources are present upstream of the valve within 10 pipe diameters. Major findings include the flow velocity required to achieve a full open, stable disk position, the magnitude of disk motion developed with these upstream disturbances with flow velocities below full open conditions, as well as disk natural frequency data which can be used to predict wear and fatique damage. Reducers were found to cause little or no performance degradation. Elbow effects must be considered when located within 5 diameters of the check valve, while severe turbulence source have significant effect at distances to 10 diameters. Clearway swing check designs were found to be particularly sensitive to manufacturing tolerances and installation variable making them likely candidates for premature failure. Reducing the disk full opening angle on these clearway designs in significant performance improvement.

36319 **(SAND—87-2121C) US DOE nuclear power equipment performance prediction program.** DeBey, T.M. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 8p. (CONF-880661—3). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88007202/JAW.

From ASME pressure vessel and piping conference; Pittsburgh, PA, USA (19 Jun 1988).

As part of their commercial nuclear power plant lifetime improvement effort, the DOE Technology Management Center at Sandia National Laboratories has initiated the development of predictive performance monitoring techniques for extending the operational life of nuclear power plants. Such techniques could offer an attractive alternative to potentially expensive equipment replacement or refurbishment. In addition to such a program helping to provide a basis for the regulatory authorities on which to permit extended operation, an effective monitoring program would be valuable in improving equipment reliability and safety during the initial license term. This effort has involved correlating component parameters with dominant failure modes and identifying potential monitoring techniques for those parameters. The current focus of this work is on emergency diesel generators that are vital safety components in nuclear power plants. A test lab has been assembled to examine the potential of specific monitoring techniques on diesel engines.

36320 **(SAND—87-2336C) Development of a {open<--quotes}combined environments{close<--quotes} life prediction methodology applicable to ambient nuclear power plant cable aging simulations.** Gillen, K.T.; Clough, R.L. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 21p. (CONF-880748—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011489/JAW.

From American Nuclear Society topical meeting on nuclear power plant life extension; Snowbird, UT, USA (31 Jul 1988).

Based on analogies to the Arrhenius approach for aging predictions in thermooxidative environments, we have derived a predictive methodology appropriate to combined radiation-thermal environments. It is shown how the approach manipulates data from accelerated environmental conditions to make meaningful predictions for low voltage cables under dose-rate/temperature conditions characteristic of ambient nuclear power plant aging. Since analyses are only possible for homogeneously-oxidized materials, calculations are included which give strong evidence that homogeneous oxidation is appropriate to the ambient nuclear power plant aging of most low voltage cables. Data consistent with the methodology are presented for a number of cable materials.

36321 **(SAND—87-2797C) US DOE nuclear plant equipment performance prediction.** DeBey, T.M. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 8p. (CONF-880748—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010836/JAW.

From American Nuclear Society topical meeting on nuclear power plant life extension; Snowbird, UT, USA (31 Jul 1988).

As part of the US Department of Energy (DOE) commercial nuclear power plant lifetime improvement effort, Sandia National Laboratories has initiated a project to investigate predictive performance monitoring techniques. The goal is to improve current equipment operation and to extend the operational life of the equipment. Early detection of equipment degradation and failure play an important role in the effort to extend plant life and also provide improved operation of all plants, new and old, through improved reliability and safety. For the plant life extension period, prognostic monitoring techniques could offer an attractive alternative to time-consuming and potentially expensive equipment replacement or refurbishment. This paper discusses the investigation of two important nuclear plant items for performance prediction methodologies: emergency diesels and steam turbines generators. 4 refs., 4 figs.

36322 **(SAND—88-1537C) Post-test analysis of a piping penetration in a 1:6-scale model of a reinforced concrete containment building.** Weatherby, J.R. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 15p. (CONF-880616—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011816/JAW.

From 4. workshop on integrity of containments for nuclear power plants; Washington, DC, USA (15 Jun 1988).

An overpressurization experiment was conducted on a scale-model of a reinforced concrete containment building. The test was terminated at an internal pressure of 145 psig due to excessive leakage through tears that developed in the steel liner. Virtually all leakage occurred through a 22-inch tear that propagated along the edge of a thickened insert plate that surrounded a piping penetration. This paper describes the results of a post-test finite element analysis of this region. Results of the analysis, visual observations, and thickness measurements all indicate that the 22-inch tear initiated due to high strains near a stud anchor. The results of the analysis also suggest that a relatively simple analytical technique can be used to estimate the pressure at which tears will initiate near penetrations in lined containment structures made of reinforced concrete.

36323 **(CONF-861185—14) RERTR [Reduced Enrichment Research and Test Reactor] Program fuel development and testing: The past year and the next.** Snelgrove, J.L. (Argonne National Lab., IL (USA)). 1986. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88010036/JAW.

From Reduced Enrichment for Research and Test Reactors (RERTR) program international meeting; Gatlinburg, TN, USA (3 Nov 1986).

Testing and demonstration of reduced-enrichment fuels under the US RERTR Program progressed steadily during the past year. The irradiation and examination of highly loaded miniature fuel plates continued in order to establish performance limits and to search for a more fundamental understanding of the swelling mechanism in aluminum-matrix dispersion fuels. Postirradiation examinations of the full-sized elements irradiated in the ORR have been completed, and the whole-core demonstration of U_3Si_2 fuel elements in the ORR is well underway. The current status of the fuel development and testing effort, the significant results obtained during the past year, and the plans for next year are summarized.

36324 **(FEI—1853) Mathematical simulation of stressed-deformed state in rod cylindrical fuel elemnts KONDOR program.** Khmelevskij, M.Ya.; Malakhova, E.I.; Dolmatov, P.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1987. 11p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701970/JAW.

A mathematical model for numerical computation of stressed-deformed stae in a rod cylindrical fuel element is developed. The model is based on preliminary discretization of the design scheme and linearization of radial parameters as radius functions. The formulation generality enables to calculate strength parameter kinetics in any circular cylindrical fuel element (e.g. annular fuel element; solid or tubular core; ceramic, metallic or dispersion fuel) for arbitrary transient operating conditions and taking into account all possible loading factors. The method is realized in the KONDOR programm (FORTRAN, ES-1061 computer). An example illustrating computation of stress kinetics in a fast reactor fuel element during transient operation is given. 2 refs.; 3 figs.

36325 **(ANL/TM—422(Rev.1)) Guide to telecommunications at ANL.** Winkler, L.; Opitz, L.C.; Heiberger, A.A. (eds.). (Argonne National Lab., IL (USA)). Apr 1988. Contract W-31109-ENG-38. 61p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010341/JAW.

The goals of this manual are to give personnel at Argonne National Laboratory an overview of available telecommunications facilities and services, to promote and encourage the use of Computing Services resources and facilities, and to describe policies and procedures that are part of the decision-making process involved in fulfilling communications requirements. This manual will be the primary source of information on telecommunications.

36326 **(CONF-880506—10) Demonstration of EBR-II power maneuvers without control rod movement.** Chang, L.K.; Mohr, D.; Planchon, H.P.; Feldman, E.E.; Messick, N.C. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 27p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010011/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

A group of five plant inherent control tests was successfully conducted in November 1987 in the Experimental Breeder Reactor II. These tests demonstrated that the plant power of a metal-fueled reactor can be passively controlled over a large power range by slowly changing the primary flow and the reactor inlet temperature. These variables are, in turn, regulated by the primary pump speed, the secondary flow, and the turbine inlet pressure. In all tests, control rods were not used to regulate power. It was demonstrated that the plant power can be controlled with reasonable accuracy without using control rods when the reactivity feedback characteristics of the reactor are well understood and the plant controllers are adequately designed.

36327 **(CONF-880506—19) Ex-vessel water-level and fission-product monitoring for LWR.** DeVolpi, A.; Markoff, D. (Argonne National Lab., IL (USA); Washington Univ., Seattle (USA). Dept. of Physics). 1988. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011999/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

Given that the need for direct measurement of reactor coolant inventory under operational or abnormal conditions remains unsatisfied, a high-energy gamma-ray detection system is described for ex-vessel monitoring. The system has been modeled to predict response in a PWR, and the model has been validated with a LOFT LOCA sequence. The apparatus, situated outside the pressure vessel, would give relative water level and density over the entire vessel height and distinguish differing levels in the downcomer and core. It would also have significant sensitivity after power shutdown because of high-energy gamma rays from photoneutron capture, the photoneutrons being the result of fission-product decay in the core. Fission-products released to the coolant and accumulated in the top of a PWR vessel would also be theoretically detectable.

36328 **(CONF-8806146—2) Application of AI technology to nuclear plant operations.** Sackett, J.I. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 28p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012048/JAW.

From American Society for Engineering Education annual conference; Portland, OR, USA (21 Jun 1988).

In this paper, applications of Artificial Intelligence (AI) Technology to nuclear-power plant operation are reviewed. AI Technology is advancing rapidly and in the next five years is expected to enjoy widespread application to operation, maintenance, management and safety. Near term emphasis on a sensor validation, scheduling, alarm handling, and expert systems for procedural assistance. Ultimate applications are envisioned to culminate in autonomous control such as would be necessary for a power system in space, where automatic control actions are taken based upon reasoned conclusions regarding plant conditions, capability and control objectives.

36329 **(EPRI-NP—5719-Vol.3) Reactor emergency action level monitor expert-system prototype: Independent review, Volume 3: Final report.** Groundwater, E.H.; Blanks, M.W. (Electric Power Research Inst., Palo Alto, CA (USA)). Apr 1988. 54p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009221/JAW.

A team from Science Applications International Corporation (SAIC) performed a third-party reveiw of the Reactor Emergency Action Level Monitor System (REALM) expert system developed by Technology Applications, Inc. (TAI) under contract to the

Electric Power Research Institute (EPRI). REALM'S purpose is to monitor power plant sensor data and determine the current Emergency Action Level (EAL), ranging from Normal Operations to General Emergency, each with corresponding reporting requirements required by the Nuclear Regulatory Commission (NRC). The expert system consists of seven sub-experts, having a total of approximately 300 inference rules and 700 objects. This report summarizes the review discussions and SAIC's specific recommendations on the preplanned review topics which surfaced during the review. 13 refs., 1 tab.

36330 **(EPRI-NP—5795) Control-room deficiencies, remedial options, and human factors research needs: Final report.** Seminara, J.L. (Electric Power Research Inst., Palo Alto, CA (USA); Seminara (J.L.), Los Altos, CA (USA)). May 1988. 147p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010312/JAW.

The post-TMI nation-wide Detailed Control Room Design Review (DCRDR) program has generated an extensive and unique body of human factors data. This report examined a sample of 25 DCRDR reports to: (1) identify and prioritize categories of human engineering discrepancies (HEDs), (2) identify novel enhancement solutions, and (3) develop candidate research programs for addressing unresolved issues. A total of 4,335 HEDs were examined and assigned to categories based on NUREG-0700 topical headings. The significance level of HEDs and associated resolution plans reported were also tabulated. This analysis yielded such data as: historical trends in reporting and resolving HEDs; effect of control room review methodology on number of HEDs reported; the relative importance of HEDs in different categories based on significance assessments at 25 plants; the distribution of specific problem areas across 25 plants. Based on a critical review of human factors problem areas and the available guidance for solving these problems, it was possible to develop a series of specific topic and generic issue research candidates. A total of 28 research candidates were developed and ranked in order of importance.

36331 **(EPRI-NP—5835M) FATIGUEPRO: On-line fatigue usage transient monitoring system: Final report.** Riccardella, P.C.; Kuo, A.Y.; Tang, S.S.; Gustin, H.L. (Electric Power Research Inst., Palo Alto, CA (USA); Structural Integrity Associates, San Jose, CA (USA)). May 1988. 79p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011000/JAW.

The objective of this research project was to develop a simplified method for evaluating fatigue usage accumulation at critical nuclear plant locations using existing instrumentation and available plant operating data. The resulting methodology permits cumulative fatigue usage to be monitored and tracked based on actual plant operating cycles rather than by counting cycles for a pre-determined set of design transients. Accomplishment of this objective has involved innovations in a number of key areas, including: (1) development of an analytical methodology to convert existing plant operating data into peak stress versus time at selected critical plant locations; (2) incorporation of the methodology into a computer software program that can be used to automatically compute and record fatigue usage accumulation on-line and in real time while the plant is running; and (3) demonstration of the methodology and software through application to one or more real plant locations for extended field testing. The methodology has been implemented in a software system called FatiguePro. A prototype system has been installed and tested for a limited number of locations at the San Onofre 2 pressurized water reactor (PWR). The results of this pilot plant study have demonstrated the feasibility of such an on-line fatigue usage transient monitoring system.

36332 (IAEA-TECDOC—444, pp 57-65) **Plant data monitoring system for the Angra-I nuclear power plant.** Otton Martins, C. (FURNAS, Rio de Janeiro (Brazil)). Dec 1987. NTIS (US Sales Only), PC A08/MF A01. Order Number DE88701820/JAW. (CONF-8610402—).

From Technical committee meeting on improving nuclear power plant safety through operator aids; Vienna, Austria (27 Oct 1986).

As a consequence of the post-TMI recommendations, a new Plant Data Monitoring System is being developed in Brazil for the Angra-I nuclear power plant. The main purpose of the system is to monitor the important safety parameters of the plant in a concise manner. In addition, the system includes an environment control system which will be used in emergency situations with a possible radioactivity release. In the present paper the technical details and the capabilities of the system are described and the procedure for implementation and integration of the new system into the existing control room concept is outlined. (author). 7 figs.

From Technical committee meeting on improving nuclear power plant safety through operator aids; Vienna, Austria (27 Oct 1986).

EDF has decided to introduce a new, fully computerized control room design for the future 1400 MW nuclear power plants. In the present paper the new control room concept is described and the time schedule for validation and implementation is outlined. (author). 4 figs.

36335 (IAEA-TECDOC—444, pp 75-93) **Operator aids in nuclear power plants in the Federal Republic of Germany.** Meyer, J. (Kraftwerk Union A.G., Erlangen (Germany, F.R.)). Dec 1987. NTIS (US Sales Only), PC A08/MF A01. Order Number DE88701820/JAW. (CONF-8610402—).

From Technical committee meeting on improving nuclear power plant safety through operator aids; Vienna, Austria (27 Oct 1986).

The development of Operator Aids in the FRG was based on an integrated approach and in accordance with basic design principles. First, criteria defining the extent of automatic control of the plant are outlined. These criteria consider optimal conditions for the operators, plant availability and plant safety. Second, the actual design of the control room including human engineering principles regarding design and environmental conditions is described. Third, details of the information system itself and the respective hardware are given. (author). 12 figs.

(Gesellschaft fuer Reaktorsicherheit m.b.H., Garching (Germany, F.R.)). Dec 1987. NTIS (US Sales Only), PC A08/MF A01. Order Number DE88701820/JAW. (CONF-8610402—).

From Technical committee meeting on improving nuclear power plant safety through operator aids; Vienna, Austria (27 Oct 1986).

Man-machine communication in power plants is increasingly relying on improved information quality provided by computerized operator support systems. It could be demonstrated that the different plant functions can be represented by one advanced software programme package, the STAR-GENERIS. The specific applications now under development include: symptom-oriented display of disturbed plant situation, post-trip analysis, integrated disturbance analysis, alarm reduction, and status surveillance of components and plant systems. From Technical committee meeting on improving nuclear power plant safety through operator aids; Vienna, Austria (27 Oct 1986).

Several operator aids have been installed or are planned at the Paks Nuclear Power Plant in Hungary. The VERONA core monitoring system has been added to the standard process-computer system to analyze and interpret the measurements of the core and the primary loops. Three different Safety Parameter Display Sytems have been tested and are partly in trial operation. A Computerized Tracking of Automatic Functions is in the design phase, as is the Computerization of the Operation Manual. (author). 3 refs, 5 figs.

From Technical committee meeting on improving nuclear power plant safety through operator aids; Vienna, Austria (27 Oct 1986).

After the TMI accident application of the most important post-TMI-concepts such as the man-machine-interface has been carried out in Italy for the two nuclear power plants Caorso (BWR, MK II) and Alto Lazio (BWR, MK III). For Caorso this includes the improvement of the control room according to NUREG-0700, the introduction of computerized systems such as the 3D MONICORE for core monitoring and management and the SPDS (under evaluation), and the implementation of new symptom-oriented emergency procedures. For Alto Lazio the following activities were carried out: a complete redesign of the control room according to NUREG-0700 concepts, a Technical Support Center (TSC) and Emergency Operating Facilities (EOF), the upgrading of the computer based supervisory system to support operation during emergency conditions and to increase operator efficiency, the design of the operator interface according to Human Factors criteria, and the implementation of new symptom-oriented emergency procedures. Finally a brief description of the main solutions adopted in the man-machine interface and human factor areas for both plants is given.

From Technical committee meeting on improving nuclear power plant safety through operator aids; Vienna, Austria (27 Oct 1986).

There are eight NPPs in operation in Spain. Five of them are Westinghouse PWR design with different power capabilities, while two are General Electric BWR design also with different power output. The last one is a Gas Cooled Reactor from a French supplier. The diversity will be increased next year, when a PWR plant of KWU design is due to start operation. This wide variety of plants with different designs increases the effort needed on the part of the regulatory body to address generic safety issues. One of these safety issues is the need for Operator Aids (OA) to improve plant safety through operational performance improvement. This paper outlines briefly the general ideas developed by the Nuclear Safety Council (Consejo de Seguridad Nuclear = CSN) to address this subject; they are presented in paragraph 2. Paragraph 3 describes the OA implementation process, while paragraph 4 is devoted to the actual situation of the OA subject for each plant (operational and under construction).

36342 **(PINSTECH—109) Renovation of PARR instrumentation and controls.** Karim, A.; Haq, I.; Akhtar, K.M.; Alam, G.D. (Pakistan Inst. of Nuclear Science and Technology, Islamabad. Nuclear Engineering Div.). Jan 1987. 61p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88702477/JAW.

The Pakistan research reactor (PARR) was commissioned in 1965 and operated since then in accordance with the requirements. In the first instance, it was proposed that the controls and instrumentation be modernized according to the state of current technology and for meeting the more stringent safety, and operational needs. A computer has been added for data acquisition, logging and analysis. A closed circuit television system has been installed to monitor access of personnel to the reactor building and for viewing the reactor core with an underwater camera. This report gives a brief account of the old instrumentation and some details of the new replacements. (orig./A.B). 17 fig.

36343 **Nuclear reactor shutdown control rod assembly.** Bilibin, K. (to Dept. of Energy, Washington, DC). US Patent 4,734,252. 29 Mar 1988. Filed date 7 Aug 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes a nuclear reactor having a reactor core and a reactor coolant flowing therethrough, a temperature responsive, self-actuated nuclear reactor shutdown control rod assembly, comprising: an upper drive line terminating at its lower end with a substantially cylindrical wall member having inner and outer surfaces; a lower drive line having a lower end adapted to be attached to a neutron absorber; a ring movable disposed about the outer surface of the wall member of the upper drive line; thermal actuation means adapted to be in heat exchange relationship with coolant in an associated reactor core and in contact with the ring, and balls located within the openings in the upper drive line. When reactor coolant approaches a predetermined design temperature the actuation means moves the ring sufficiently so that the balls move radially out from the recess and into the space formed by the second portion of the ring thereby removing the vertical support for the lower drive line such that the lower drive line moves downwardly and inserts an associated neutron absorber into an associated reactor core resulting in automatic reduction of reactor power.

36344 Programming for a nuclear reactor instrument simulation. Cohn, C. *Simulation;* 50: No. 1, 25-27(Jan 1988).

This note discusses 8086/8087 machine-language programming for simulation of nuclear reactor instrument current inputs by means of a digital-analog converter (DAC) feeding a bank of series input resistors. It also shows FORTRAN programming for generating the parameter tales used in the simulation. These techniques would be generally useful for high-speed simulation of quantities varying over many orders of magnitude.

36345 Techniques for examination and metallurgical damage assessment of pressure vessels. Jaske, C.E. (Battelle's Columbus Div., Columbus, OH (US)). pp 103-110 of Performance and evaluation of light water reactor pressure vessels. Rungta, R.; Gilman, J.D.; Bamford, W.H. New York, NY; American Society of Mechanical Engineers (1987). (CONF-870636—).

From 5. national congress on pressure vessels and piping; San Diego, CA, USA (28 Jun 1987).

Metallurgical techniques are used to examine and assess the damage or degradation that occurs in nuclear power plant reactor pressure vessels during long-term service. Those techniques are used to quantify the amount of radiation embrittlement, thermal fatigue cracking, and corrosion fatigue cracking. Those damage mechanisms and the current techniques of surveillance testing and nondestructive inspection used to assess them are reviewed briefly. Emerging damage assessment techniques that may find future use are discussed in more detail. The potential application of the following six emerging techniques is addressed: (1) miniature specimen testing, (2) reconstituted specimen testing, (3) nondestructive measurement of material properties, (4) acoustic emission monitoring, (5) surface replication, and (6) electrochemical testing.

36346 (DP-MS—87-143) Preliminary risks associated with postulated tritium release from production reactor operation. O'Kula, K.R.; Horton, W.H. (Savannah River Lab., Aiken, SC (USA)). 1988. Contract AC09-76SR00001. 9p. (CONF-880505—15). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009307/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

The Probabilistic Risk Assessment (PRA) of Savannah River Plant (SRP) reactor operation is assessing the off-site risk due to tritium releases during postulated full or partial loss of heavy water moderator accidents. Other sources of tritium in the reactor are less likely to contribute to off-site risk in non-fuel melting accident scenarios. Preliminary determination of the frequency of average partial moderator loss (including incidents with leaks as small as .5 kg) yields an estimate of {approximately}1 per reactor year. The full moderator loss frequency is conservatively chosen as 5 {times} 10/sup {minus/3} per reactor year. Conditional consequences, determined with a version of the MACCS code modified to handle tritium, are found to be insignificant. The 95th percentile individual cancer risk is 4 {times} 10/sup {minus/8} per reactor year within 16 km of the release point. The full moderator loss accident contributes about 75% of the evaluated risks. 13 refs., 4 figs., 5 tabs.

36347 (EGG/10282—1138) An aerial radiological survey of the Trojan Nuclear Plant and surrounding area, Prescott, Oregon: Date of survey: July--August 1986. Dahlstrom, T.S. (EG and G Energy Measurements, Inc., Las Vegas, NV (USA)). Feb 1988. Contract AC08-83NV10282. 17p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011668/JAW.

An aerial radiological survey was conducted during the period 24 July through 2 August 1986 over a 124-square-kilometer (48-square-mile) area surrounding the Trojan Nuclear Plant located on the Columbia River at Prescott, Oregon. The survey was conducted at a nominal altitude of 46 meters (150 feet) with line spacings of 76 meters (250 feet). Count rates were converted to exposure rates at 1 meter above the ground. A contour map of the terrestrial gamma exposure rate was prepared and overlaid on a USGS topographic map of the area. The exposure rates varied from 8 to 10 microroentgens per hour (μRh) in the southern and northernmost regions of the survey area with somewhat lesser rates of 6.5 to 8.0 μRh in the immediate vicinity of LongviewKelso, Washington. The highest area of increased activity was directly attributed to the main units of the plant and indicated the presence of ^{60}Co and ^{58}Co. Soil samples and ion chamber measurements were obtained at four locations to support the aerial data. An additional 11 soil samples were collected along the shoreline of the Columbia River. 6 refs., 11 figs., 4 tabs.

36348 (INIS-mf—11153, pp 29-35) **3. Siting of nuclear power plants.** Navratil, J. 1987. (In Czech). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88780081/JAW.

In Nuclear power. CAEC lecturers' manual.

The area for nuclear power plant siting in the CSSR is defined by the Federal Ministry of Fuels and Power according to the planned distribution of needs and sources of electric power and heat supply. The preliminary siting is the responsibility of state regional planning institutes TERPLAN and URBION. The investment intent study is made by Energoprojekt, a design organization, assisted by other specialized organizations. The study then serves as the information source for Czechoslovak-Soviet expertise which confirms the feasibility and acceptability of the construction and operation of a nuclear power plant in the given locality. A final decision on the nuclear power plant site is made by the Presidium of the Federal Government. General criteria are discussed used in site selection, including technical feasibility of construction, environmental protection including nuclear safety, minimization of disturbance of other interests in the use of the territory, and economy. In addition to the nuclear power plants under construction, four more areas are considered for the implementation of the Czechoslovak nuclear program till the year 2000, viz., northern Moravia, eastern Bohemia, northern Bohemia and Prague. (Z.M.).

36349 (INIS-mf—11153, pp 55-68) **7. Environmental impact of nuclear power plants.** Singer, J. 1987. (In Czech). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88780081/JAW.

In Nuclear power. CAEC lecturers' manual.

The environmental impact is compared of nuclear power plants and of coal-firing plants. The effect on the biosphere is discussed of the construction and operation of nuclear power plants. The irradiation risk associated with nuclear power plants, ionizing radiation sources, radiation protection methods, etc. are characterized with respect to specific radiation effects. Described in more detail are radionuclide migration from the nuclear power plant to surface water, in surface water to aquatic biocenosis, and the radioisotope transport chains atmosphere-man and surface and ground waters-man. Of non-radiation environmental impact of nuclear power plants, attention is devoted to the thermal burden to the environs of the plants, chemical pollution of the environs and the effect of high-voltage transmission lines. (Z.M.).

36350 (INIS-mf—11200) Location sites for nuclear power plants and the public drinking water supplies. An investigation of the possible effects of a nuclear meltdown accident on the public drinking water supply which depends on surface waters as basic element. (Samenwerkende Rijn- en Maaswaterleidingbedrijven (RIWA), Amsterdam (Netherlands). Werkgroep Kerncentrales). May 1987. 25p. (In Dutch). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702377/JAW.

This report presents the results of a study by the Dutch RIWA- Working Group Nuclear Power Plants, of the possible effects of a nuclear-reactor melt-down accident upon the drinking-water supply in the Netherlands which is dependent on surface waters. The aim of this report is to contribute to the 're-consideration with regard to siting of nuclear power plants' of the Dutch government. In the case of a nuclear-reactor melt-down accident in the Netherlands or directly adjacent countries, surface waters destined for drinking-water production may be contaminated severely. The amount of contamination depends, among other things, upon the distance, wind direction, dry as well as wet deposition and the

features of the place yielding drinking water. From calculations of contamination of surface waters in the case of open- supply build up it appears that the derived norm of the radionuclide cocktail may be exceeded for a period of weeks up to several months or even years. There are reasons to draw the same conclusion for supply build up in the dunes by means of surface infiltration in the dunes. A melt-down accident can cause very severe contamination. Also here it can be stated that, in the case of a calamity in the Netherlands or directly adjacent countries, a norm transgression may occur for weeks up to years. In view of the risks which nuclear power plants can hold for the drinking-water supply which depends upon surface-waters as basis element. Severe objections should be made with respect to the siting of nuclear power plants in the Netherlands unless the occurrence of melt-down accidents could be excluded. 11 refs.; 4 figs.; 7 tabs.

36351 (INIS-mf—11203) **Radiating water. Effects of nuclear power on the drinking water supply.** Bakker, J.; Harle, N.; Heijkers, H.; Schoene, S. (eds.). (Vereniging Milieudefensie, Amsterdam (Netherlands)). Apr 1987. 154p. (In Dutch). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702380/JAW.

From a nuclear power plant in operation radioactivity is continuously effusing into the environment, through the chimney, cooling waters and the loss of solid waste. In this account attention is concentrated on tritium which enters, in the form of gas and tritiated water from nuclear power plants under 'normal' operation, the aquatic environment and which, because it can not be purified from the water and because its effluences in surface waters are larger than those of other radioactive waste products, forms the largest threat for the drinking-water supply. In ch. 1 the health risks of tritium are outlined. In particular the genetic risks are insufficiently known until now. In ch. 2 the amount of tritium effluences are estimated, which appears to be many times higher than was generally accepted until now. What does this imply for the Dutch surface waters? In ch. 3 the question of the source term is discussed and in ch. 4 the source term is translated into the effects upon the aquatic environment and especially upon the drinking-water supply. In ch. 5 advisements for policies are formulated. The policy of the Dutch government until now is viewed and nuclear power is judged on the base of three starting points of radiation policy. Therein the demands are included which are inevitable in order to protect the Dutch aquatic environment from a too large radioactivity burden. 91 refs.; 5 figs.; 1 table.

36352 (INIS-mf—11222, pp 33-34) **Modification of regulations for performing geophysical and engineering seismological surveys during pre-project and project preparation of nuclear power plants.** Cidlinsky, K.; Simunek, P. (Geofyzika, n.p., Brno (Czechoslovakia); Energoprojekt, Prague (Czechoslovakia)). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

The association of the socialist countries for the development of nuclear power Interatomehnergo has drawn up regulations and guidelines for engineering seismological surveys for pre-project and project preparation of nuclear power plants. The draft national regulations of the USSR, GDR and CSSR are to be unified and approved shortly. A list is given of the criteria which condition the siting of a nuclear power plant in a certain locality, emphasising the range and significance of geological and engineering seismological surveying in the given locality. (Z.M.). 70 figs., 25 tabs., 139 refs.

36353 (INIS-mf—11222, pp 35-36) **Geophysical survey of the site of the North Moravian nuclear power plant.** Cidlinsky, K.; Firbas, P.; Nehybka, V.; Smerdova, J. (Geofyzika, n.p., Brno (Czechoslovakia)). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

A brief characteristic is presented of the results of the geophysical survey of the Blahutovice nuclear power plant site in North Moravia, CSSR. Next to seismic methods the geophysical survey also used detailed gravimetric and geoelectric methods; for the first time in Czechoslovakia the method of detailed seismic zoning. For the said measurement a network was installed in 1983 of five sites, one on the considered site of the nuclear power plant, the others along a perimeter with a radius of roughly 12 km. The results of the geophysical survey have shown that the Blahutovice locality is on a compact block where no geophysical or geological anomalies have been recorded. (Z.M.).

36354 (INIS-mf—11222, pp 37-45) **Medium transfer functions for the site of North Moravian nuclear power plant.** Bartak, H. (Energoprojekt, Prague (Czechoslovakia)). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

The method of seismic zoning was used in the geological survey of the Blahutovice nuclear power plant site in North Moravia (CS). As against the original Soviet method, the method used was broadenend to include the detection of the so-called transfer function of the medium which characterizes the ability of the environment to strengthen or weaken seismic waves. Briefly described are numerical methods which served to determine the impact of certain physical parameters on the character of the transfer function of the environment in the Blahutovice site and some results of calculations are presented. The impact of the following factors is given: the velocity of the propagation of waves in the layer of Quaternary sediments, the velocity of the propagation of seismic waves in the layer of Neogene sediments and the impact of the presence of the Quaternary layer. The calculations were made using the MICRO program. Experimental methods will be used for measuring the reliability of the said calculations of the transfer function of the medium. (Z.M.). 8 figs., 2 tabs., 4 refs.

36355 (NRPB-R—211) **Radiological impact of routine discharges during 1970-1984 and estimated discharges up to 1989 from the UK civil nuclear power programme.** Lawson, G.; McColl, N.; Jones, J.A.; Williams, J.; Dionian, J.; Cooper, J.R. (National Radiological Protection Board, Chilton (UK)). Jan 1988. 104p. H.M. Stationery Office, price Pound 7.00.

This report provides information about the radiological impact on the population of Europe of routine liquid and atmospheric discharges from civil nuclear sites in the United Kingdom. Discharges occurring in the years 1970 to 1984 are used, together with NRPB estimates of discharges from 1985 to 1989. At the time of calculation, 1984 was the most recent year for which complete discharge data for the United Kingdom were published. Collective effective dose equivalent commitments to the population of Europe arising from each year's discharges are calculated. These are presented together with the collective effective dose equivalent commitments truncated at 500 years. More detailed information is given for discharges in 1975 and estimated discharges in 1989, including an estimate of the radiological impact on the population of the United Kingdom.

36356 (NUREG—1273) **Technical findings and regulatory analysis for Generic Safety Issue II.E.4.3, "Containment Integrity Check".** Serkiz, A.W. (Nuclear Regulatory Commission, Washington, DC (USA)). Apr 1988. 165p. NTIS, PC A08/MF A01;1. Order Number TI88008757/JAW.

This report contains the technical findings and regulatory analysis for Generic Safety Issue II.E.4.3, "Containment Integrity Check." An evaluation of the containment isolation history from 1965 to 1983 reveals that (except for a small number of events) containment integrity has been maintained and that the majority of reported events have been events related to exceeding Technical Specification limits (or 0.6 of the allowable leakage level). In addition, more recent risk analyses have shown that allowable leakage rates even if increased by a factor of 10 would not significantly increase risk. Potential methods of continuous monitoring are identified and evaluated. Therefore, these technical findings and risk evaluations support closure of Generic Safety Issue II.E.4.3.

36357 (PINSTECH/HPD—130) Area and environmental gamma dose monitoring at PINSTECH. Javed, M.; Awan, M.A.; Ahmad, S.; Afsar, M.; Orfi, S.D. (Pakistan Inst. of Nuclear Science and Technology, Islamabad. Health Physics Div.). Nov 1986. 18p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702478/JAW.

Radiation dose monitoring of various radioactive laboratories including PARR building, radioactive waste disposal area and the environment upto initial peripheral limits of PINSTECH has been carried out by TLD's installed at different locations. Average dose rates in terms of percentage of dose limits have been compiled. The results for the year 1985 have been discussed in this report.

Inst. de Recherche Technologique et de Developpement Industriel (IRDI)). Aug 1987. 17p. (In French). (CONF-871004—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753451/JAW.

From International conference on the utilization of multipurpose research reactors and related international co-operation; Grenoble, France (19 Oct 1987).

To satisfy the requests of experimenters, two horizontal beams, tangential at core, have been created. After a brief recall of the Isis reactor the author describes the realized works and gives a summary description of the two beams equipment.

36359 (CONF-880422—1) Software engineering for the EBR-II data acquisition system conversion. Schorzman, W. (Argonne National Lab., Idaho Falls, ID (USA)). 1988. Contract W-31109-ENG-38. 20p. (CONF-880422—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009950/JAW.

From Topical meeting on engineering for nuclear plant operation and maintenance; Myrtle Beach, SC, USA (17 Apr 1988).

The purpose of this paper is to outline how EBR-II engineering approached the data acquisition system (DAS) software conversion project with the restraints of operational transparency and six weeks for final implementation and testing. Software engineering is a relatively new discipline that provides a structured philosopy for software conversion. The software life cycle is structured into six basic steps: 1) initiation, 2) requirements definition, 3) design, 4) programming, 5) testing, and 6) operations. These steps are loosely defined and can be altered to fit specific software applications. DAS software is encompassed from three sources: 1) custom software, 2) system software, and 3) in-house application software. A data flow structure is used to describe the DAS software. The categories are: 1) software used to bring signals into the central processer, 2) software that transforms the analog data to engineering units and then logs the data in the data store, and 3) software used to transport and display the data. The focus of this paper is to describe how the conversion team used a structured engineering approach and utilized the resources available to produce a quality system on time. Although successful, the conversion process provided some pit falls and stumbling blocks. Working through these obstacles enhanced our understanding and surfaced in the form of LESSONS LEARNED, which are gracefully shared in this paper.

36360 (CONF-8804126—1) Neutron flux enhancement in the NRAD reactor. Weeks, A.A.; Heidel, C.C.; Imel, G.R. (Argonne National Lab., Idaho Falls, ID (USA)). 1988. Contract W-31109-ENG-38. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010000/JAW.

From 11. annual TRIGA users conference; Bethesda, MD, USA (10 Apr 1988).

In 1987 a series of experiments were conducted at the NRAD reactor facility at Argonne National Laboratory - West (ANL-W) to investigate the possibility of increasing the thermal neutron content at the end of the reactor's east beam tube through the use of hydrogenous flux traps. It was desired to increase the thermal flux for a series of experiments to be performed in the east radiography cell, in which the enhanced flux was required in a relatively small volume. Hence, it was feasible to attempt to focus the cross section of the beam to a smaller area. Two flux traps were constructed from unborated polypropylene and tested to determine their effectiveness. Both traps were open to the entire cross-sectional area of the neutron beam (as it emerges from the wall and enters the beam room). The sides then converged such that at the end of the trap the beam would be 'focused' to a greater intensity. The differences in the two flux traps were primarily in length, and hence angle to the beam as the inlet and outlet cross-sectional areas were held constant. It should be noted that merely placing a slab of polypropylene in the beam will not yield significant multiplication as neutrons are primarily scattered away.

36361 (CONF-8806165—1) Small break LOCA analysis of the ONRL high flux isotope reactor. Wilson, T.L. Jr.; Cook, D.H.; Sozer, A. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 16p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012200/JAW.

From EPRI conference on power plant simulators and modeling; Charlotte, NC, USA (15 Jun 1988).

A digital simulation program, HFIRSYS, was developed using MMS to analyze small break loss of coolant events in the ORNL High Flux Isotope Reactor. The code evaluates the response of the primary reactor system including automatic controls actions resulting from breaks in auxiliary piping connected to the primary. The primary output of the code is the margin to the onset of nucleate boiling expressed as a ratio of heat flux which would cause boiling to the current hot channel heat flux. A description of the model, validation results and a sample transient are presented.

36362 (DOE/ER/02096—T3) University of Arizona TRIGA Reactor: 1986-1987 annual utilization report. Nelson, G.W. (Arizona Univ., Tucson (USA). Dept. of Nuclear and Energy Engineering). 1986. Contract AC07-76ER02096. 4p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88007321/JAW.

This is the annual report for the University of Arizona TRIGA Reactor under Contract No. AC02-76ER02096 covering the period July 1, 1986 through June 30, 1987 including the 1986-87 Academic Year. The purpose of this report is to document the facility usage which is possible because of DOE support under the contract. The reactor is operated under License R-52 with the United States Nuclear Regulatory Commission.

36363 (FEI—1735) Automated system for studying irradiation creep of materials in the BR-10 nuclear. Aim and design concept. Kruglov, A.S.; Bykov, V.N.; Chubarov, S.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1985. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88701966/JAW.

General concepts of construction aim and structure of the KRIP (complex reactor investigation of creep) scientific research automated system (SRAS) designed for studies in the fields of radiation materials technology carried out in the BR-10 reactor, are considered. A complex of intrachannel test devices providing for stress excitation in materials of samples tested is the central element of the KRIP SRAS. The microprocessor system based on the SM-1800 computer provides for programmed control of the device operation under automatic condition. Development of the KRIP SRAS is a stage on the way of creation of the automated research complex designed for the expansion of the volume of works and decrease of manpower requirements and cost of a definite experiment. 6 refs.; 2 figs.

36364 (ORNL/TM—10444) Evaluation of HFIR [High Flux Isotope Reactor] pressure-vessel integrity considering radiation embrittlement. Cheverton, R.D.; Merkle, J.G.; Nanstad, R.K. (eds.). (Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OR21400. 273p. NTIS, PC A12/MF A01;1; GPO Dep. Order Number DE88008959/JAW.

The High Flux Isotope Reactor (HFIR) pressure vessel has been in service for 20 years, and during this time, radiation damage was monitored with a vessel-material surveillance program. In mid-November 1986, data from this program indicated that the radiation-induced reduction in fracture toughness was greater than expected. As a result, a reevaluation of vessel integrity was undertaken. Updated methods of fracture-mechanics analysis were applied, and an accelerated irradiations program was conducted using the Oak Ridge Research Reactor. Results of these efforts indicate that (1) the vessel life can be extended 10 years if the reactor power level is reduced 15% and if the vessel is subjected to a hydrostatic proof test each year; (2) during the 10-year life extension, significant radiation damage will be limited to a rather small area around the beam tubes; and (3) the greater-than-expected damage rate is the result of the very low neutron flux in the HFIR vessel relative to that in samples of material irradiated in materials-testing reactors (a factor of $\sim 10^4$ less), that is, a rate effect.

36365 (PINSTECH/NED—128) Effect of different reflector materials on core neutronics of LEU cores of MTR type research reactor. Khan, L.A.; Qazi, M.K. (Pakistan Inst. of Nuclear Science and Technology, Islamabad. Nuclear Engineering Div.). Sep 1987. 29p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702479/JAW.

Effect of different reflector materials like light water, heavy water, graphite, beryllium, and beryllium oxides on core excess reactivity and multigroup neutron fluxes have been studied using standard computer codes WIMS-D and EXTERMINATOR-II. Three energy groups, X-Y calculations have reflected on two opposite faces by single row/double row of the reflector material followed by light water The core reflected by single row of light water, heavy water, graphite, beryllium and beryllium oxide has a percentage excess reactivity of 7.38, 10.03, 9.82, 11.93 and 11.67, respectively. Total excess reactivity of the core becomes 7.38, 10.63, 12.86 and 12.54 percentage respectively, when the second row of the reflector material is introduced.

36366 (PTB-FMRB—112) Filtered neutron beams at the FMRB - review and current status. Alberts, W.G.; Dietz, E. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Forschungs- und Messreaktor). Dec 1987. 59p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753585/JAW.

A review is presented of our experience with filtered neutron beams installed in beam tubes of the Research and Measurement Reactor Braunschweig since 1976: Desing of the filters and measurement of the beam parameters are reported and an outline of the research work done with the beams is given. The present status of the irradiation facility, which consists of 5 beams (144 keV, 24.5 keV, 2 keV, 0.2 keV and thermal neutrons), is described in some detail to allow understanding of the physical as well as the technical prerequisites for performing calibrations of neutron measuring instruments. An appendix contains the actual beam parameters.

36367 (WHC-SA—0144) Fast Flux Test Facility sodium pump operating experience - mechanical. Buonamici, R. (Westinghouse Hanford Co., Richland, WA (USA)). Nov 1987. Contract AC06-87RL10930. 9p. (CONF-871199—3). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011947/JAW.

From US/UK specialist meeting on sodium pumps; San Jose, CA, USA (9 Nov 1987).

The Heat Transport System (HTS) pumps were designed, fabricated, tested, and installed in the Fast Flux Test Facility (FFTF) Plant during the period from September 1970 through July 1977. Since completion of the installation and sodium fill in December 1978, the FFTF Plant pumps have undergone extensive testing and operation with HTS testing and reactor operation. Steady-state hydraulic and mechanical performances have been and are excellent. In all, FFTF primary and secondary pumps have operated in sodium for approximately 75,000 hours and 79,000 hours, respectively, to August 24, 1987.

36368 Comparisons of PRD components for various EBR-II configurations. Meneghetti, D.; Kucera, D.A. (Argonne National Lab., IL (USA)). *Annals of Nuclear Energy;* **14**: No. 9, 473-480(1987). Contract W-31-109-ENG-38.

Comparison of detailed calculations of contributions by region and component of the power-reactivity-decrements (PRD) for four differing loading configurations of the Experimental Breeder Reactor-II (EBR-II) are given. The linear components and Doppler components are calculated. The non-linear (primarily subassembly bowing) components are deduced by differences relative to measured total PRD values. Variations in linear components range from about 10% to as much as about a factor of two depending upon the component. The deduced non-linear components can differ both in magnitude and sign. Effects of differing assumptions of the nature of the fuel-to-clad interactions upon the PRD components are also calculated.

36369 Time constants and feedback transfer functions of EBR-II subassembly types. Grimm, K.N.; Meneghetti, D. (Argonne National Lab., IL (USA)). *Annals of Nuclear Energy;* **14**: No. 9, 481-487(1987). Contract W-31-109-ENG-38.

Time constants, feedback reactivity transfer functions and power coefficients are calculated for stereotypical subassemblies in the EBR-II reactor. These quantities are calculated from nodal reactivities obtained from a reactor kinetic code analysis for a step change in power. Due to the multiplicity of eigenvalues, there are several time constants for each nodal position in a subassembly. Compared with these calculated values are analytically derived values for the initial node of a given channel.

36370 (BMU—1986-133) Concept to support the safety assessment in nuclear power plants with probabilistic methods. Status report. Methodology, risk limit line curves and practical applications. Gottschalk, P.A.; Bracht, K.; Fidorra, J.; Friederichs, H.; Gruendler, D.; Hofer, E.; Jahns, A.; Kaestle, H.J.; Krzykacz, B.; Liemersdorf, H. (Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.); Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.)). 1986. 208p. (In German). (GRS-A—991). GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.).

Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten.

The discussion among experts centers on the question whether risk limits based on probabilistic considerations could be introduced. A great number of different approaches are available worldwide. They concern different subaspects. Unified yardsticks for a comparative evaluation of the total spectrum of events ranging from normal operation to deviations and incidents till hypothetical accidents in nuclear power plants are not available. The book shows a special path to consistent systematics. Methodology and approach are demonstrated under the aspect of the individual risk and for a limitation of the incidence probability for stochastic effects of radiation. Farmer's idea of a limit-line curve as a means for safety assessment is developed further. A risk limit-line curve is made according to Cox and Baybutt's suggestion. The curve delin-

eates delayed-injury-relevant individual doses according to their expected frequency in dependence from the dose level. Numerical data are derived from their pollution control concept of the Radiation Protection Ordinance. The construction of the limit-line curve is described and its possible use for a consistent assignment to dose, frequency and risk classes is shown. The RIGREP computer programme for explicit calculation of the curve and derived variables is presented. Pertinent results from reactor safety research are taken to demonstrate a concept for the evaluation of the risk induced by incident and accident.

36371 **(BNL-NUREG—40365) Severe accident core heatup transients in modular high temperature gas-cooled reactors without operating Reactor Cavity Cooling Systems.** Kroeger, P.G. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 9p. (CONF-880532—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88002093/JAW.

From American Nuclear Society topical meeting; Seattle, WA, USA (1 May 1988).

The ultimate decay heat removal system for the current Modular High Temperature Gas-Cooled reactors is a completely passive natural convection air cooling loop. This paper considers an extremely remote accident scenario, where even this passive system fails, and heat rejection is only via a layer of thermal insulation to the reactor silo structure and the surrounding soil. The results show that even in this case the peak fuel temperatures remain well within safe limits. However, vessel and concrete temperatures can - under extreme circumstances and after several weeks - reach temperature levels at which structural failure becomes possible.

36372 **(CEA-CONF—9263) Experimental validation for calcul methods of structures having shock non-linearity.** Brochard, D.; Buland, P. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 9p. (In French). (CONF-8711193—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753469/JAW.

From Symposium on non linear behaviour of reinforced concrete submitted to a seismic excitation; Saint-Remy-Les-Chevreuse, France (25 Nov 1987).

For the seismic analysis of non-linear structures, numerical methods have been developed which need to be validated on experimental results. The aim of this paper is to present the design method of a test program which results will be used for this purpose. Some applications to nuclear components will illustrate this presentation.

36373 **(CEA-IPSN-INFO—70) Tricastin 4 shutdown for safety injection circuit repair.** (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire). Jun 1987. 1p. (In French). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88752563/JAW.

36374 **(CNEA-NT—49/85) Radiation protection criteria for cases of probabilistic disruptive events.** Beninson, D.J. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Gerencia de Proteccion Radiologica y Seguridad). 1985. 8p. (In Spanish). (CNEA-REPO—17). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702229/JAW.

The individual risk limitation for the case of probabilistic disruptive events is studied, when the radiation effects cease to be only stochastic; the proposed criterion is applied for the case of high level waste repositories. The protection's optimization results from the differential cost-benefit. More general procedures of decision theory that use probabilistically defined utility functions are considered for its calculation. These more general procedures can be applied also in cases where radiation exposures are only potential, to optimize the required level of safety features. It is shown that for disruptive events of low probability and large resulting consequences, the concept of 'expectation' of consequence can not be used in decision making, but that the use of probabilistically based utility functions can conceptually assure a consistent approach in deciding the required level of safety. The use of utility functions of logaritmic form to assign weights to consequences involving different loss of life is explored (M.E.L.).

36375 **(CONF-880455—3) Simulating unprotected accidents for advanced liquid metal reactors using the SAS4A accident analysis code.** Tentner, A.M.; Dunn, F.E.; Kalimullah; Miles, K.J. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 9p. NTIS, PC A02;3. Order Number DE88009934/JAW.

From Conference of the Society of Computer Simulation; Orlando, FL, USA (18 Apr 1988).

To ensure that the public health and safety are protected during any accident in a Liquid Metal Fast Breeder Reactor (LMFBR), many accidents are analyzed for their potential consequences. The SAS4A code system, described in this paper, provides such an analysis capabililty, including the ability to analyze low probability events such as the Hypothetical Core Disruptive Accidents (HCDAs). The SAS4A code system has been designed to simulate the events that occur in a LMFBR core during the initiating phase of a Hypothetical Core Core Disruptive Accident. During such postulated accident scenarios as the Loss-of-Flow and Transient Overpower events, a large number of interrelated physical phenomena occur during a relatively short time. These phenomena include transient heat transfer and hydrodynamic events, coolant boiling and fuel and cladding melting and relocaton. Due to the strong neutronic feedback present in a nuclear reactor, these events can significantly influence the reactor power. The SAS4A code system is used in the safety analysis of nuclear reactors, in order to estimate the energetic potential of very low probability accidents. The results of SAS4A simulations are also used by reactor designers in order to build safer reactors and eliminate the possibility of any accident which could endanger the public safety.

36376 **(CONF-880506—3) Probabilities of inherent shutdown of unprotected events in innovative liquid metal reactors.** Mueller, C.J.; Wade, D.C. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 12p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009946/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

The uncertainty in predicting the effectiveness of inherent shutdown in innovative liquid metal cooled reactors with metallic fuel results from three broad contributing areas of uncertainty: (1) the inability to exactly predict the frequency of ATWS events with potential to challenge the safety systems and require inherent shutdown; (2) the approximation of representing all such events by a selected set of "generic scenarios"; and (3) the inability to exactly calculate the core response to the selected generic scenarios. This paper discusses the work being done to address each of these contributing areas, identifies the design and research approaches being used at Argonne National Laboratory to reducing the key contributions to uncertainties in inherent shutdown, and presents results. The conditional probabilities (given ATWS initiation) of achieving temperatures capable of defeating inherent shutdown are shown to range from {approximately}0.1% to negligible for current designs.

36377 **(CONF-880506—8) The US Liquid Metal Reactor Development Program.** Till, C.E.; Arnold, W.H.; Griffith, J.D. (Argonne National Lab., IL (USA); Westinghouse Hanford Co., Richland, WA (USA); USDOE Assistant Secretary for Nuclear Energy, Washington, DC). 1988. Contract W-31109-ENG-38. 7p. (CONF-880506—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009951/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

The US Liquid Metal Reactor Development Program has been restructured to take advantage of the opportunity today to carry out R and D on truly advanced reactor technology. The program gives particular emphasis to improvements to reactor safety. The new directions are based on the technology of the Integral Fast Reactor (IFR). Much of the basis for superior safety performance using IFR technology has been experimentally verified and aggressive programs continue in EBR-II and TREAT. Progress has been made in demonstrating both the metallic fuel and the new

electrochemical processes of the IFR. The FFTF facility is converting to metallic fuel; however, FFTF also maintains a considerable US program in oxide fuels. In addition, generic programs are continuing in steam generator testing, materials development, and, with international cooperation, aqueous reprocessing. Design studies are carried out in conjunction with the IFR technology development program. In summary, the US maintains an active development program in Liquid Metal Reactor technology, and new directions in reactor safety are central to the program.

36378 (CONF-880506—12) Integral fast reactor safety features. Cahalan, J.E.; Kramer, J.M.; Marchaterre, J.F.; Mueller, C.J.; Pedersen, D.R.; Sevy, R.H.; Wade, D.C.; Wei, T.Y.C. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 13p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010012/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

The Integral Fast Reactor (IFR) is an advanced liquid-metal-cooled reactor concept being developed at Argonne National Laboratory. The two major goals of the IFR development effort are improved economics and enhanced safety. In addition to liquid metal cooling, the principal design features that distinguish the IFR are: (1) a pool-type primary system, (2) an advanced ternary alloy metallic fuel, and (3) an integral fuel cycle with on-site fuel reprocessing and fabrication. This paper focuses on the technical aspects of the improved safety margins available in the IFR concept. This increased level of safety is made possible by (1) the liquid metal (sodium) coolant and pool-type primary system layout, which together facilitate passive decay heat removal, and (2) a sodium-bonded metallic fuel pin design with thermal and neutronic properties that provide passive core responses which control and mitigate the consequences of reactor accidents.

36379 (CONF-880506—14) Behavior of metallic fuel in treat transient overpower tests. Bauer, T.H.; Wright, A.E.; Robinson, W.R.; Klickman, A.E. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01. Order Number TI88010042/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

Results and analyses are reported for TREAT in-pile transient overpower tests of margin to cladding failure and pre-failure axial expansion of metallic fuel. In all cases the power rise was exponential on an 8 s period until either incipient or actual cladding failure was achieved. Test fuel included EBR-II driver fuel and ternary alloy, the reference fuel of the Intergral Fast Reactor concept. Test pin burnup spanned the widest range available. The nature of the observed cladding failure and resultant fuel dispersals is described. Simple models are presented which describe observed cladding failures and pre-failure axial expansions yet are general enough to apply to all metal fuel types.

36380 (CONF-880506—15) PRD [power-reactivity-decrement] components of a homogeneous U10Zr-fueled 900 MWt LMR. Meneghetti, D.; Kucera, D.A. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010039/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

The linear and Doppler feedback components of the regional contributions of the power-reactivity-decrement (PRD) for a representative 900 MWt homogeneous U10Zr-fueled sodium-cooled reactor are calculated. The PRD is the reactivity required to bring the reactor from zero-power hot-critical condition to a given power level. These components are further separated into power dependent and power-to-flow dependent parts. The values are compared with corresponding quantities calculated for the Experimental Breeder Reactor II (EBR-II). The implications of these comparisons upon inherent safety characteristics of metal-fueled sodium-cooled reactors are discussed. The effects of fuel axial restraint on feedback, resulting from possible fuel-clad interactions due to burnup are also calculated. The possible enhancement of desirable feedbacks by use of appropriately designed subassembly-duct bowing feedback characteristics is estimated.

36381 (CONF-880506—17) A risk characterization of safety research areas for Integral Fast Reactor program planning. Mueller, C.J.; Cahalan, J.E.; Hill, D.J.; Kramer, J.M.; Marchaterre, J.F.; Pedersen, D.R.; Sevy, R.H.; Tilbrook, R.W.; Wei, T.Y.; Wright, A.E. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 19p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011199/JAW.

From Safety of next generation power reactors; Seattle, WA, USA (1 May 1988).

This paper characterizes the areas of Integral Fast Reactor (IFR) safety research in terms of their importance in addressing the risk of core disruption sequences for innovative designs. Such sequences have traditionally been determined to constitute the primary risk to public health and safety. All core disruption sequences are folded into four fault categories: classic unprotected (unscrammed) events; loss of decay heat; local fault propagation; and failure of critical reactor structures. Event trees are used to describe these sequences and the areas in the IFR Safety and related Base Technology research programs are discussed with respect to their relevance in addressing the key issues in preventing or delimiting core disruptive sequences. Thus a measure of potential for risk reduction is obtained for guidance in establishing research priorites.

36382 (CONF-880702—6) Passive safety and the advanced liquid metal reactors. Hill, D.J.; Pedersen, D.R.; Marchaterre, J.F. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 19p. (CONF-880702—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009953/JAW.

From 23. intersociety energy conversion engineering conference; Denver, CO, USA (31 Jul 1988).

Advanced Liquid Metal Reactors being developed today in the USA are designed to make maximum use of passive safety features. Much of the LMR safety work at Argonne National Laboratory is concerned with demonstrating, both theoretically and experimentally, the effectiveness of the passive safety features. The characteristics that contribute to passive safety are discussed, with particular emphasis on decay heat removal systems, together with examples of Argonne's theoretical and experimental programs in this area.

36383 (CONF-880748—5) Evaluation of aged concrete structures for continued service in nuclear power plants. Naus, D.J.; Marchbanks, M.F.; Arndt, E.G. (Oak Ridge National Lab., TN (USA); Nuclear Regulatory Commission, Washington, DC (USA)). 1988. Contract AC05-84OR21400. 12p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011832/JAW.

From American Nuclear Society topical meeting on nuclear power plant life extension; Snowbird, UT, USA (31 Jul 1988).

Results are summarized of a study on concrete component aging and its significance relative to continued service of nuclear power plants (NPPs) beyond the initial period for which they were granted operating licenses. Progress is presented of a second study being conducted to identify and provide acceptance criteria for structural safety issues which the USNRC staff will need to address when applications are submitted for continued service of NPPs. Major activities under this program include: development of a materials property data base, establishment of structural component assessment and repair procedures, and development of a methodology for determination of structural reliability.

36384 (CONF-8806153—1) Role of BWR secondary containments in severe accident mitigation: issues and insights from recent analyses. Greene, S.R. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 21p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011837/JAW.

From 4. workshop on containment integrity; Arlington, VA, USA (14 Jun 1988).

All commercial boiling water reactor (BWR) plants in the US employ primary containments of the pressure suppression design. These primary containments are surrounded and enclosed by a secondary containment consisting of a reactor building and refueling bay (MK I and MK II designs), a shield building, auxiliary

building and fuel building (MK III), or an auxiliary building and enclosure building (Grand Gulf style MK III). Although secondary containment designs are highly plant specific, their purpose is to minimize the ground level release of radioactive material for a spectrum of traditional design basis accidents. While not designed for severe accident mitigation, these secondary containments might also reduce the radiological consequences of severe accidents. This issue is receiving increasing attention due to concerns that BWR MK I primary containment integrity would be lost should a significant mass of molten debris escape the reactor vessel during a severe accident. This paper presents a brief overview of domestic BWR secondary containment designs and highlights plant-specific features that could influence secondary containment severe accident survivability and accident mitigation effectiveness. Current issues surrounding secondary containment performance are discussed, and insights gained from recent ORNL secondary containment studies of Browns Ferry, Peach Bottom, and Shoreham are presented. Areas of significant uncertainty are identified and recommendations for future research are presented.

36385 (DBW-RIZA—87-014x) Radioactivity after 'Chernobyl'. Cesium spread in Dutch waters caused by the 'Chernobyl' accident: first results and adapted research program. Hettling, H.K. (Rijkswaterstaat, Lelystad (Netherlands). Dienst Binnenwateren - Rijksinstituut voor de Zuivering van Afvalwater (RIZA)). Jan 1987. 34p. (In Dutch). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702231/JAW.

In consequence of the reactor accident in Chernobylsk a large number of Dutch waters have been investigated for the occurrence and spread of radionuclides, especially with the intention to know better the effects of long-living radionuclides (Cs-137) on the aquatic environment. For humans Cs-137 is of particular importance because of its long lifetime (30 years) and because it is accumulated predominantly in the muscles, which results in an increment of internal irradiation. These results also can be employed for forecasting the effects and follow-ups of calamities and of effluents from nuclear-power plants. Finally Cs may be used as tracer for studying hydrological processes (mixing-rate in underwater bottom, behaviour of micropollution, sedimentation). Concrete points for attention are horizontal and vertical spread of cesium, the processes and mechanisms which play a role therein and the effects upon the (biotic and abiotic) aquatic environment. The field research carried out for this purpose is subdivided in a monitory program and a process investigation. Because of operational problems until now only the analysis results from May up to July 1986 are available. Besides this field research a literature investigation has been carried out of the environment of Cs-137, the most important long-living radionuclide which efflued from the reactor accident. In this report the results are inventarized of the field research and literature investigation carried out until now. A linking program has been drawn up, based on these results. 14 refs.; 2 figs.; 1 table.

36386 (DOE/NE/37945—T1) Simulation-based expert system for nuclear reactor diagnostics: Final report, September 15, 1985-April 30, 1988. Lee, J.C.; Martin, W.R.; Wehe, D.K. (Michigan Univ., Ann Arbor (USA). Dept. of Nuclear Engineering). Apr 1988. Contract AC02-85NE37945. 23p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010182/JAW.

An expert system methodology combining model- and rule-based algorithms has been developed for diagnosis of off-normal events in nuclear power plants. A rule-based reasoning system is used in a fuzzy logic structure to analyze plant data heuristically to form a set of hypotheses about a particular transient. Hypothesis testing and fault magnitude estimation are performed with simulation programs to model plant behavior. A new parameter estimation algorithm, called the simulation filter, has been developed for accurate simulation of plant dynamics with low-order physical models of plant components. A critical safety function approach is used to delineate the complexity of a power plant. The simulation-based expert system methodology has been incorporated as the Rx code. Validity of the Rx methodology has been tested through simulation of the Three Mile Island accident. Methods of systematically generating diagnostic rules through pattern recognition and fault tree encoding have been developed and demonstrated on a preliminary basis.

36387 (DPST—88-469) Reactor materials program process water component failure probability. Daugherty, W. L. (Savannah River Lab., Aiken, SC (USA)). 12 Apr 1988. Contract AC09-76SR00001. 66p. NTIS, PC A04;3. Order Number DE88011676/JAW.

The maximum rate loss of coolant accident for the Savannah River Production Reactors is presently specified as the abrupt double-ended guillotine break (DEGB) of a large process water pipe. This accident is not considered credible in light of the low applied stresses and the inherent ductility of the piping materials. The Reactor Materials Program was initiated to provide the technical basis for an alternate, credible maximum rate LOCA. The major thrust of this program is to develop an alternate worst case accident scenario by deterministic means. In addition, the probability of a DEGB is also being determined; to show that in addition to being mechanistically incredible, it is also highly improbable. The probability of a DEGB of the process water piping is evaluated in two parts: failure by direct means, and indirectly-induced failure. These two areas have been discussed in other reports. In addition, the frequency of a large bread (equivalent to a DEGB) in other process water system components is assessed. This report reviews the large break frequency for each component as well as the overall large break frequency for the reactor system.

36388 (EGG-M—01288) Estimated TMI-2 vessel thermal response based on the lower plenum debris configuration. Tolman, E.L.; Moore, R.A. (EG and G Idaho, Inc., Idaho Falls (USA)). 1988. Contract AC07-76ID01570. 30p. (CONF-880724—16). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007705/JAW.

From 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference; Houston, TX, USA (24 Jul 1988).

The TMI-2 accident resulted in extensive reactor core damage and release of fission products from the fuel. Recent defueling work has confirmed that 30 to 40% (40 to 55 metric tons) of the orginial core material achieved melting temperatures, and an estimated 15 metric tons of molten core material relocated to the lower head region of the reactor vessel. Because of the extensive core damage and core material relocation, the TMI-2 accident provides a unique opportunity to extend our understanding of the physical processes controlling the latter stages of in-vessel core damage progression. The TMI-2 data have provided important insight into the initial core heatup and relocation mechanisms, interaction of the molten core materials with the core support structures and vessel coolant, and the potential localized damage to the instrument assemblies and vessel head. This paper presents the results of recent analytical work to evaluate the long-term thermal response of the lower head.

36389 (EPRI-NP—4917) Commercial-grade motors in safety-related applications: Final report. Holzman, P.M. (Strategic Technology and Resources, Winchester, MA (USA)). Apr 1988. 160p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010309/JAW.

The objective of this project was to discuss the process necessary to utilize commercial grade equipment in safety related applications and to provide utilities with guidance for accepting commercial grade motors for safety-related applications. The generic commercial-grade concepts presented in this report can be successfully applied to motors. Commercial grade item utilization has the greatest applicability to motors in "mild" environments, because these motors are essentially similar to commercial grade motors in materials, construction methods, and capabilities. The acceptance process is less applicable to motors that are subject to "harsh" environments during postulated accidents, because of the unique design features and testing required to qualify these motors.

36390 (EPRI-NP—5753M) Source Term Experiments Project (STEP): A summary: Final report. Baker, L. Jr.; Fink, J.K.; Simms, R.; Schlenger, B.J.; Herceg, J.E. (Argonne National Lab., IL (USA)). Mar 1988. Contract W-31109-ENG-38. 128p. NTIS, PC A07/MF A01 - Research Reports Center, Box 50490, Palo Alto, CA 94303; 1; GPO Dep. Order Number DE88007532/JAW.

A series of four experiments aimed at characterizing the radiological source term associated with postulated severe light water reactor accidents has been conducted at Argonne National Laboratory's TREAT Facility. The experiments were designed to provide data regarding the physicochemical properties, near the point of origin, of the biologically important volatile fission products released early in such accidents. This report summarizes the conduct and the posttest examination results of the STEP tests, which were simulations of the early phases or risk-dominating accident sequences in both pressurized water reactors and boiling water reactors. The thermal-hydraulic results of the tests, including the hydrogen generated by Zircaloy-steam reaction, were described by code calculations. The calculated maximum fuel temperatures ranged from about 2200 K to 2900 K for the tests. Deposits on coupons from the sample tree, located directly above the four fuel element bundle, and from coupons, deposition plates, and impactor wires, located in canisters adjacent to the test vessel, were examined by scanning electron microscope (SEM), electron microprobe, and other methods. The SEM images were used to determine aerosol size distributions and concentrations. An extensive release of fission products occurred for the low pressure tests, STEP-1 and -2. The relative quantities, morphologies, and chemical characteristics were determined for the released fission products: cesium, iodine, tellurium, molybdenum, and rubidium; and the fuel element materials: tin, zirconium, and uranium. A smaller release of fission products occurred in the high pressure tests, STEP-3 and -4, because of the lower fuel temperatures which resulted from a natural convective flow process induced under the high pressure conditions.

36391 (EPRI-NP—5769-Vol.2) Degradation and failure of bolting in nuclear power plants: Volume 2: Final report. Nickell, R.E. (Applied Science and Technology, Poway, CA (USA)). Apr 1988. 316p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009899/JAW.

A four-year program to resolve the generic safety issue of bolting degradation and failure in nuclear power plants has developed guidelines for material selection, bolting preload control, and plant operation, as well as a realistic method for evaluating the structural integrity of bolted joints. These measures can help improve plant availability while reducing radiation exposure and costs of maintenance and inspection. This report provides the technical basis for resolution of the generic issue of bolting degradation and failure in nuclear power plants.

36392 (EPRI-NP—5777-Vol.1) Defensive strategies for reducing susceptibility to common-cause failures: Volume 1, Defensive strategies: Final report. Crellin, G.L.; Mott, J.E.; Smith, A.M. (Saratoga Engineering Consultants, Inc., San Jose, CA (USA)). Jun 1988. 100p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011429/JAW.

This report presents the final results of EPRI Project RP2169-5. The study, begun in 1982, had three overall objectives: (1) develop a better method for understanding fault events, in general, and common cause failures (CCF) in particular; (2) develop a well focused data base for analyzing factors that describe or influence CCFs; (3) develop and assess defensive measures that might be employed against CCFs. In response to the first objective, a Classification System was developed as a logical and credible method for dissecting and understanding fault events, with special attention on the means to clearly identify and evaluate those events with multiple faults deriving from a common or shared cause. This system, which employs the concept of Linear and Branched Events, is briefly described herein with examples illustrating its use. A data base consisting of over 1700 events was compiled to meet the second objective, and a variety of analyses drawn from that data base are presented. The major portion of the report is devoted to the investigations conducted on defensive measures for CCFs. Analytically-based, data-based and expert-based approach are each discussed in detail, and provide a variety of guidelines that may be used to delineate specific defensive actions for both new plant designs as well as currently operating plants. 17 refs., 25 figs., 1 tab.

36393 (EPRI-NP—5811) Experimental simulation of a small-scale Babcock & Wilcox reactor model: Final report. Kiang, R.L.; Jeuck, P.R. III; Shrader, E.J. (Electric Power Research Inst., Palo Alto, CA (USA)). Mar 1988. 196p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010313/JAW.

This report documents the design, the instrumentation system, the data-acquisition system, and the testing of a small-scale, low pressure model of the cooling systems of a Babcock & Wilcox pressurized water reactor. This work is part of a larger program to address some of the safety issues in the B & W design. This test data are stored on data tapes; they are available to qualified requesters through EPRI. The primary use of these data is expected to be code verification and comparisons with results from other test facilities in the program.

36394 (EPRI-NP—5821) TMI-2 technology transfer progress report: Interim report. Owrutsky, S.; Schwartz, F.L. (Electric Power Research Inst., Palo Alto, CA (USA); Pentek, Inc., Coraopolis, PA (USA)). May 1988. 87p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011001/JAW.

The objective of this report is to communicate the scope and key accomplishments of the TM1-2 technology transfer program; to show the relationship of various TM1-2 activities to the overall cleanup effort and to other EPRI-sponsored nuclear power programs.

36395 (EUR—11043) Analysis of the print media in Europe following the Chernobyl accident. Otway, H.; Haastrup, P.; Cannell, W. (Commission of the European Communities, Luxembourg). 1987. 76p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752573/JAW.

The print media coverage of the Chernobyl accident was analysed in seven European countries. The goal was to identify common communications problems and to suggest how they might be resolved. Aside from difficulties with technical information on units of radiation exposure, contamination, and effects, the media did a reasonably good job of presenting to the public the information they were given by official sources. Some evidence of confusion was found, and it affected the credibility of communications, but the press seemed to be reflecting confusion existing within crisis management teams and the scientific community rather than creating it. Some of the more common problems are discussed and ideas for improving crisis management and the communication of information about risks are explored.

36396 (FEI—1857) Functional possibilities of program complex for diagnostics and evaluation of residual resources of some elements of nuclear power plants. Bogomolov, V.N.; Makarova, I.N.; Puchkov, P.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1987. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88701971/JAW.

Development and construction of modern systems of technical diagnostics are one of the ways for providing NPP trouble-free operation. Technique for diagnostics and estimation of residual resources containing the following stages has been suggested earlier: construction of standard mathematical models, calculation of residuals (differences between observed and calculated parameter values); revealing residual trends and predicting output parameter values. A set of programs being a part of a special software of diagnostic complex has been developed to support this technique. The "off-line diagnostics" system is used to analyse data from operating NPPs and to work off algorithms of their technical state diagnostics. Its use permitted to considerably increase the data processing efficiency.

36397 (GAO/RCED—86-213BR) Nuclear safety: Comparison of DOE's Hanford n-reactor with the Chernobyl reactor. (General Accounting Office, Washington, DC (USA)). 1986. 62p. General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

GAO found that many differences exist between the Department of Energy's N-Reactor and the reactor near Chernobyl. One of the most significant differences involves the reactors' inherent physics responses to increases in coolant temperature. Other differences are (1) N-Reactor uses a metal form of uranium fuel, while the Chernobyl reactor uses an oxide form of uranium fuel and (2) N-Reactor uses once-through emergency cooling rather than a recirculating emergency cooling system like Chernobyl's. GAO found that the overall safety of N-Reactor relies heavily on successful operation of a different type of system - a reactor confinement system. N-Reactor has been operating 3 years beyond its expected life, and many systems and components are deteriorating. Maintaining safe operations through the mid-1990s will require considerable upgrading and rehabilitation. To extend safe operation of N-Reactor beyond the year 2000, major renovations - costing as much as $1.2 billion - will be required.

36398 (GAO/RCED—87-124) Nuclear regulation: A perspective on liability protection for a nuclear plant accident. (General Accounting Office, Washington, DC (USA)). 1987. 48p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The Price-Anderson Act encourages private industry development of nuclear energy. It establishes a source of funds to compensate personal injury and property damage from a nuclear accident and limits the liability of private industry for such accidents. The indemnity provisions of the act, which allow the Nuclear Regulatory Commission and the Department of Energy to enter into new indemnity agreements and set the liability limits, expire in August 1987. GAO believes that the act's indemnity authority should be extended and that its liability protection is too low to provide reasonable compensation for the worst nuclear plant accident. The financial consequences of a catastrophic accident at 115 of 119 plants could far exceed the liability limit. The act covers all off-site accident damages resulting from the release of radioactive material. However, it does not clearly state whether the costs for a precautionary evacuation are covered when a release appears imminent but does not actually occur.

36399 (GRS-F—160) Reports on research programs in the field of reactor safety sponsored by the Federal Ministry of Research and Technology. Reported period: January 1-June 30, 1987. (Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)). Oct 1987. 327p. (In German). NTIS (US Sales Only), PC A15/MF A01. Order Number DE88753539/JAW.

Investigations on the safety of light water reactors (LWR) being performed in the framework of the research program on reactor safety (RS-projects) are sponsored by the Federal Ministry for Research and Technology (BMFT). Objective of this program is to investigate in greater detail the safety margins of nuclear power plants and their systems and the further development of safety technology. Besides the investigations of LWR tasks also projects on the safety of advanced reactors are sponsored by the BMFT. The individual reports are classified according to the research program on the safety of LWRs 1977-1980 of the BMFT. Another table of contents uses the same classification system as applied in the nuclear safety index of the CEC (Commission of the European Communities) and the OECD (Organization for Economic Cooperation and Development). The reports are arranged in the sequence of their project numbers.

36400 (IAEA-INSAG-TN—2) Importance for nuclear safety of efficient feedback of operational experience. Report by the International Nuclear Safety Advisory Group. (International Atomic Energy Agency, Vienna (Austria)). Sep 1987. 12p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701985/JAW.

Experience of practical operation is a valuable source of information for improving and optimizing the safety and reliability of nuclear power plants. Therefore it is essential to collect information on abnormal events occurring at plants during operation and on all deviations from normal performance by systems and personnel that could be precursors of accidents. For this purpose it is necessary to establish hierarchical systems to feedback operational safety experience at utility, national and international levels and to make these systems as effective as possible. The present report attempts to identify the safety objectives of these systems, to analyse the difficulties presently encountered and to suggest possible improvements.

36401 (INIS-BR—1047) Regulatory activities in reactor safety. Salvatore, J.E.L. (Comissao Nacional de Energia Nuclear de Brasil, Rio de Janeiro). 1987. 50p. (In Portuguese). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702311/JAW.

The safety philosophy in designs and operation of nuclear power plants and, the steps for evaluating the safety and quality assurance, in the licensing procedure are described. The CNEN organization structure and the licensing procedure for nuclear power plants in Brazil are presented. (M.C.K.).

36402 (INIS-GB—134) Statement on nuclear incidents at nuclear installations -third quarter 1987. (Health and Safety Executive, London (UK)). 29 Mar 1988. 4p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753515/JAW.

Four incidents are reported. Carbon dioxide containing a small amount of radioactive material was released at the Chapelcross works of British Nuclear Fuels. However, air monitoring showed the contamination to be small. Surfaces contaminated were cleaned and the reactor was allowed to restart as scheduled. Refurbishment work at the Berkeley Nuclear Power Station sewage plant revealed five radioactive particles. The sludge has been isolated until a disposal method is found. Contamination on a coverall was found at the Sellafield reprocessing plant. Both the operators who may have worn the coverall may have received excess doses. Improvements in the possible source of contamination have been made. A leak of gas from the Hunterston B nuclear power station was found to be from a failed joint on a bolted flange on the bypass circuit heat exchanger. The joint has been repaired. (U.K.).

36403 (INIS-mf—11222, pp 119-124) Use of probability risk assessment method for assessing nuclear power plant safety. Suchomel, J. (Vyskumny Ustav Jadrovych Elektrarni, Trnava (Czechoslovakia)). 1987. (In Slovak). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

The advantages are characterized of the method of the probability safety assessment in the sense of the application of the probability risk assessment method to problems of nuclear power plant safety. The advantages consists in that the method systematically and genuinely integrates in a unified system all safety aspects: project charactrisitcs of nuclear power plants, operating procedures, operating experience, reliability of equipment, reliability of the human factor, physical processes during reactor core meltdown accidents and the potential health hazards and effects of accidents on the environment of nuclear power plants. The development is described of the methods of probability safety assessment and the main knowledge is summed up relating to their application with regard to the damage of reactor core, and the general aspects of nuclear power plant hazards. (Z.M.).

36404 (INIS-mf—11222, pp 125-131) Trends in development of method of probability assessment of nuclear power plant safety. Dach, K. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

Trends are discussed in the development of methods of the probability safety assessment of nuclear power plants. The research effort is focused on the study of uncertainties, the study of the human factor effect, the study of failures with common cause and

on the creation of expert systems. It is stated that at present the methods of probability assessment of safety are suitable for assessing the safety of nuclear power plants allowing the use of detailed knowledge of risks for raising the level of nuclear safety. At the present level of development they can serve as an important instrument for improving the quality of safety documentation and the decision-making sphere. (Z.M.). 2 figs., 3 tabs., 4 refs.

36405 (INIS-mf—11222, pp 132-145) **Problems of impact load on nuclear power plant structures.** Adamik, V.; Matejovic, P. (Vyskumny Ustav Jadrovych Elektrarni, Jaslovske Bohunice (Czechoslovakia)). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

The most important aspects are summed up of aircraft accidents as this type of accident covers all possible types of impact loads, external and internal for nuclear power plants. The philosophy is presented of approaches to the solution of these problems and concrete technical procedures are given. The analysis of the present state of the solution of this problem area shows that the local behaviour of reinforced concrete will have to be studied under impact load as well as the protection of internals of affected buildings with regard to induced vibrations. (Z.M.). 9 figs., 2 tabs., 23 refs.

36406 (INIS-mf—11222, pp 146-150) **Effect of external load on nuclear power plant building technology.** Ricicha, P. (Ceske Vysoke Uceni Technicke, Prague (Czechoslovakia)). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

A brief characteristics is presented of the program for the calculation of effects of external load on nuclear power plant structures. The program is designed for the calculation of short-term dynamic effects when the interval of solution does not exceed the multiple of the longest eigenperiod of the linearized system. It uses direct integration of equations of motion. The range of the usability of the program depends on the element library. Available at present there are five elements of deformation type in which the primary approximated variables are the shift or the rotation. Graphically illustrated are the results of three nonlinearized solutions: the deflection of axially symmetrical thin spherical cap, the deflection of the reinforced concrete beam and the deflection of the cooling tower as a result of impact of an air pressure wave from the explosion of a gas cloud. (Z.M.). 5 figs.

36407 (INIS-mf—11222, pp 151-156) **Failure probability for nuclear power plant components at seismic load.** Pecinka, L. (Skoda, Plzen (Czechoslovakia). Zavod Energeticke Strojirenstvi). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

The probability is discussed of the failure of components of nuclear power plants by earthquakes which may initiate a loss of coolant accident and also certain transient processes. Briefly described is a mathematical model based on the determination of such a value of subgrade acceleration which will cause the exhaustion of the material reserves of the component and thereby its fracture or loss of functional ability. The application of this model is demonstrated on the calculation of the probability failure of the main circulating pipe of the Dukovany nuclear power plant. (Z.M.). 8 refs.

36408 (INIS-mf—11222) **Safety and operating reliability of reactor WWER. External load.** Pecinka, L. (ed.). (Ceskoslovenska Komise pro Atomovou Energii, Prague). 1987. 158p. (In Czech and Slovak). (CONF-8611245—). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW.

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

The Proceedings from the seminar "Safety and operating reliability of reactor WWER - external load" held in Marianske Lazne (CS), November 5 to 6, 1986, comprises the full texts of 19 papers of which 16 belong in the INIS Subject Scope. The seminar was the fifth in the regular cycle which has been held every two years since 1978 and was initially focused only on seismic load. The papers deal with the results of the geophysical survey of future sites of Czechoslovak nuclear plants, novelities in geophysics, seismic tests of the Mochovce nuclear power plant and the method of the probability risk assessment which presents a qualitatively novel view of nuclear safety. (Z.M.). 124 figs., 44 tabs., 261 refs.

36409 (INIS-mf—11222, pp 57-64) **Some experience from seismic check-ups of components of Mochovce nuclear power plant.** Masopust, R. (Vystavba Elektraren Skoda, Prague (Czechoslovakia)). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

The first Czechoslovak nuclear power plant with the so-called partial anti-seismic design will be built in Mochovce. The evaluation of seismic resistance is prescribed only for equipment and systems which secure the safe reactor shutdown, the withdrawal of residual heat and prevent uncontrolled release of radioactivity into the environment. The following variants were compared in the calculation analysis of the primary loop of the WWER-440 reactor for the Mochovce nuclear power plant: the seismically unsecured loop of a usual design for WWER-440 nuclear power plants, the loop provided with mechanical or hydraulic dampers and the loop provided with viscose shock absorbers. The tests showed that technically most suitable is the use of viscose shock absorbers which do not completely block the movement of the system during the earthquake but absorb it intensively. The viscose shock absorbers are also much cheaper than the dampers. Briefly described is experience with the experimental evaluation of the seismic resistance of components of the Mochovce nuclear power plant. Great difficulty was encountered by the non-existence in Czechoslovakia of a seismic table allowing simultaneous excitation in the vertical and horizontal directions. (Z.M.). 18 refs.

36410 (INIS-mf—11222, pp 65-69) **Experience from seismic check-ups of nuclear power plant components.** Podrouzek, J. (Vystavba Elektraren Skoda, Prague (Czechoslovakia)). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

The experience is discussed with seismic tests of technological equipment of conventional power plants exported from the Czechoslovak Socialist Republic to seismic regions which are being used at the Mochovce nuclear power plant. The calculation assessment of seismic resistance was made mainly at the SKODA enterprise. There are certain difficulties with experimental assessment because Czechoslovakia only has three large testing units and several small test stands. This mainly concerns electrical equipment, measurement systems and control system and air technology systems whose seismic resistance can only be tested experimentally. There are also unsolved problems concerning the classification of systems, namely to determine which systems are to be tested for seismic resistance and which are not. Breifly described are existing problems of seismic tests of equipment for the Temelin nuclear power plant. Next to the primary coolant circuit which as seismically resistant will be delivered from the USSR it will be necessary to test the seismic resistance of the live steam inlet tubing for the turbine, the condenser mounting, high- and low-voltage distribution systems, etc. (Z.M.). 15 refs.

36411 (INIS-mf—11222, pp 70-79) **Seismic analysis of V 213-C reactor for Mochovce nuclear power plant.** Zeman, V. (Vysoka Skola Strojni a Elektrotechnicka, Plzen (Czechoslovakia)). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

The mathematical model is described of the V 213-C reactor serving the seismic analysis made for the Mochovce nuclear power plant. As against the original model the model of the upper reactor part was detailed and was divided into two subsystems. This is a discrete dynamic model with 24 degrees of freedom. The model allows to obtain seismic response of the reactor by the spectrum response method. This is done using the SEIZ3 program written in FORTRAN IV. Next to the said spectrum response method a new method was processed and applied based on approaches of stochastic dynamics, namely the so-called scatter method. For this mehod a program was written in FORTRAN IV under the name STOCHA1 whose input parameters are based on SEIZ3 program outputs. Some results of calcultions are presented in tables and graphs. (Z.M.). 4 figs., 2 tabs., 6 refs.

36412 (INIS-mf—11222, pp 80-84) **Calculation of shell components of V 213-C reactor for Mochovce nuclear power plant.** Cechura, M. (Skoda, Plzen (Czechoslovakia). Zavod Energeticke Strojirenstvi). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

Briefly described is the calculation of the stress of the support cylinder of the V 213-C reactor for the Mochovce nuclear power plant. The support cylinder is a thin-walled cylindrical shell with the diameter and wall thickness graded by height. The respective equation of motion was solved by numerical integration and the stochastic modal method. It is stated that numerical integration gives more accurate results but is more demanding on calculation time. The stochastic method is quicker but the accurate result strongly depends on suitably selected input conditions. (Z.M.). 1 fig., 7 refs.

36413 (INIS-mf—11222, pp 85-94) **Seismic calculation of supporting nodes and large-size parts of shielding for Mochovce nuclear power plant.** Pysek, J. (Skoda, Plzen (Czechoslovakia). Zavod Energeticke Strojirenstvi). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

Some results are presented of seismic calculation of the suport node and shielding parts of the V 213-C reactor for the Mochovce nuclear power plant. The support node represents the system fixing the pressure vessel in the shaft in the flange joint area. It functions as a support transmitting horizontal forces acting on the pressure vessel and prevents the rotation of the pressure vessel around its longitudinal axis. (Z.M.). 9 figs., 4 tabs., 4 refs.

36414 (INIS-mf—11222, pp 95-103) **Effect of friction on static and dynamic behavior of piping systems.** Rejent, B.; Kosek, Z. (Energoprojekt, Prague (Czechoslovakia)). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

As concerns the Mochovce and Temelin nuclear power plants, the construction of piping systems must not only meet the conditions of static strength but also of seismic resistance. Friction forces in the supports of piping systems are high and substantially change the character of deformations and the level of real strain in the system. In view of the fact that problems relating to significant friction have not as yet been resolved even in the statics and dynamics of machines and structures, a simplified specific technical solution is devised for the solution of the said technical problem. The soution consists in reducing resistance by mounting the horizontal tubing paths on pairs of material which are permissible with regard to static load capacity and also provide seismic resistance. The limits are determined of the coefficient of friction in the supports which with sufficient safety meet the seismic conditions of the Czechoslovak territory. (Z.M.). 8 figs., 10 refs.

36415 (INIS-mf—11222, pp 116-118) **Standard-based calculational check-ups of seismic effects on first class piping.** Roucka, M. (Kralovopolska Strojirna, Brno (Czechoslovakia)). 1987. (In Czech). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702804/JAW. (CONF-8611245—).

From 5. seminar on safety and operating reliability of reactor WWER; Marianske Lazne, Czechoslovakia (5 Nov 1986).

The problems are discussed of the application of valid standards in the calculation of seismic effects on the piping systems of the Mochovce nuclear power plant. The calculations may be made using accelerograms, e.g., by the method of numerical integration, or using the spectrum response method. (Z.M.). 4 tabs.

36416 (ITEF—194(1986)) **Some problems of the modified TVR-M reactor safety.** Mikhajlov, V.M.; Myrtsymova, L.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1986. 16p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702108/JAW.

Some physical aspects, concerning the safety of the modernized TVR-M reactor and its temporary spent fuel storage facility are considered. Delayed neutron efficiency and neutron lifetime in the reactor are calculated. Changes of multiplication factor during moderator and coolant draining and reduction of control rod worths in the reactor with lightwater coolant are determined. Subcriticality degree of the melted reactor core and the storage facility with heavy and light water is obtained. Reduction of energy release during safety rod (SR) drop is calculated. It is shown, that the reactor core meltdown in the case of the maximum hypothetical accident does not lead to critical mass occurance. During SR emergency drop and reactor shutdown the energy release in it is decreased up to 10% for 10s and up to 1% for an hour. It is shown, that when the coolant circuit is filled with light water the reactor becomes over critical with all control and safety rods being dropped. Therefore, for the reactor core emergency cooling in the case of complete heavy water (coolant) loss it is required to develop additional technical and organization procedures. 6 refs.; 8 tabs.

36417 (IWGATWR—1-2, pp 38-40) **Safety concept and development of nuclear power engineering.** Ponomarev-Stepnoj, N.N.; Protsenko, A.N.; Slesarev, I.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). Dec 1987. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702119/JAW. (CONF-8705279—).

From 1. meeting of the international working group on advanced technologies for water cooled reactors; Vienna, Austria (18 May 1987).

36418 (KTA-GS—53) **KTA status report II/1987 (June 1, 1987-December 1, 1987).** (Kerntechnischer Ausschuss (KTA), Koeln (Germany, F.R.)). Dec 1987. 58p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753584/JAW.

The status report II/87 gives an account of the KTA activities and achievements in the regulatory sector in the period of the 41th KTA meeting (June 1 to December 1, 1987). The survey of rules and codes approved of has been elaborated in cooperation with the chairmen of the working groups and sub-committees. The report is intended to provide quick information on developments in the nuclear regulatory system. Information on regulatory work in progress is given in the KTA manual, indicating changes e.g. in subject fields, technical details, time-schedules, or members of working groups.

36419 (NUREG—1266-Vol.2) **NRC [Nuclear Regulatory Commission] safety research in support of regulation, 1987.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research). May 1988. 57p. NTIS, PC A04/MF A01 - GPO. Order Number TI88010188/JAW.

This report, the third in a series of annual reports, was prepared in response to congressional inquiries concerning how nucle-

ar regulatory research is used. It summarizes the accomplishments of the Office of Nuclear Regulatory Research during 1987. The goal of this office is to ensure that research provides the technical bases for rulemaking and for related decisions in support of NRC licensing and inspection activities. This report describes both the direct contributions to scientific and technical knowledge with regard to nuclear safety and their regulatory applications.

38420 (NUREG—1320) Nuclear fuel cycle facility accident analysis handbook. Ayer, J.E.; Clark, A.T.; Loysen, P.; Ballinger, M.Y.; Mishima, J.; Owczarski, P.C.; Gregory, W.S.; Nichols, B.D. (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Industrial and Medical Nuclear Safety). May 1988. 522p. NTIS, PC A22/MF A01 - GPO. Order Number TI88011368/JAW.

The Accident Analysis Handbook (AAH) covers four generic facilities: fuel manufacturing, fuel reprocessing, waste storage/solidification, and spent fuel storage; and six accident types: fire, explosion, tornado, criticality, spill, and equipment failure. These are the accident types considered to make major contributions to the radiological risk from accidents in nuclear fuel cycle facility operations. The AAH will enable the user to calculate source term releases from accident scenarios manually or by computer. A major feature of the AAH is development of accident sample problems to provide input to source term analysis methods and transport computer codes. Sample problems and illustrative examples for different accident types are included in the AAH.

38421 (NUREG/CR—4836) Approaches to uncertainty analysis in probabilistic risk assessment. Bohn, M.P.; Wheeler, T.A.; Parry, G.W. (Sandia National Labs., Albuquerque, NM (USA)). Jan 1988. Contract AC04-76DP00789. 7p. (SAND—87-0871). NTIS, PC A06/MF A01 - GPO;1. Order Number TI88009290/JAW.

An integral part of any probabilistic risk assessment (PRA) is the performance of an uncertainty analysis to quantify the uncertainty in the point estimates of the risk measures considered. While a variety of classical methods of uncertainty analysis exist, application of these methods and developing new techniques consistent with existing PRA data bases and the need for expert (subjective) input has been an area of considerable interest since the pioneering Reactor Safety Study (WASH-1400) in 1975. This report presents the results of a critical review of existing methods for performing uncertainty analyses for PRAs, with special emphasis on identifying data base limitations on the various methods. Both classical and Baysian approaches have been examined. This work was funded by the US Nuclear Regulatory Commission in support of its ongoing full-scope PRA of the LaSalle nuclear power station. Thus in addition to the review, this report contains recommendations for a suitable uncertainty analysis methodology for the LaSalle PRA.

38422 (NUREG/CR—5113) Findings of the Peer Review Panel on the Draft Reactor Risk Reference Document, NUREG-1150. Kastenberg, W.E.; Apostolakis, G.; Bickel, J.H.; Blond, R.M.; Board, S.J.; Epstein, M.; Hofmann, P.; King, F.K.; Ostrach, S.; Reed, J.W. (Nuclear Regulatory Commission, Washington, DC (USA); Lawrence Livermore National Lab., CA (USA)). May 1988. Contract W-7405-ENG-48. 228p. (UCID—21346). NTIS, PC A10/MF A01 - GPO;1. Order Number TI88011713/JAW.

This report contains the finding of the {open+-quotes}NUREG-1150 Peer Review Panel{close+-quotes} on the methodology and results presented in the Draft Reactor Risk Reference Study (NUREG-1150) and supporting documentation. The report consists of two principal parts: the chairman's report, which summarizes the principal issues of the review, and the individual members' reports, which supply the individual findings and technical details of the fourteen reviewers.

38423 (OEFZS—4413) Severe fuel damage projects. Sdouz, G. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H.). Oct 1987. 58p. (In German). (RS—297/87). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88702204/JAW.

After the descriptions of the generation of a Severe Fuel Damage Accident in a LWR the hypothetical course of such an accident is explained. Then the most significant projects are described. At each project the experimental facility, the most important results and the concluding models and codes are discussed. The selection of the projects is concentrated on the German Projekt Nukleare Sicherheit (PNS), tests performed at the Idaho National Engineering Laboratory (INEL) and smaller projects in France and Great Britain. 25 refs., 26 figs.

38424 (SAND—87-1048C) IFCI: An integrated code for calculation of all phases of fuel-coolant interactions. Young, M.F. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 17p. (CONF-880724—8). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88005105/JAW.

From 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference; Houston, TX, USA (24 Jul 1988).

A problem of considerable interest in reactor safety is the possibility of molten fuel-coolant interactions (FCIs) occurring during a hypothetical light water reactor core meltdown accident. These interactions may occur under a variety of conditions either within the reactor vessel or in the reactor cavity. The IFCI computer code is being developed to investigate the FCI problem at reactor scale in as mechanistic a manner as possible. This paper discusses the main features of the IFCI code and the results of the first test problem run with IFCI.

38425 (SAND—87-2376C) On the melting of reactor core particle beds. Dosanjh, S.S. (Sandia National Labs., Albuquerque, NM (USA)). Dec 1987. Contract AC04-76DP00789. 32p. (CONF-880724—5). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88004683/JAW.

From 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference; Houston, TX, USA (24 Jul 1988).

During severe nuclear reactor accidents similar to Three-Mile Island, fragmentation of the fuel rods can convert the reactor core into a large rubble bed composed primarily of UO_2 and ZrO_2 particles. In the present study a one-dimensional model is developed for the melting and refreezing of such a bed. The analysis includes mass conservation equations for the species of interest (UO_2 and ZrO_2); a momentum equation that represents a balance among drag, capillary and gravity forces; an energy equation which incorporates the effects of convection by the melt, radiation and conduction through the bed and internal heat generation; and a UO/sub 2-ZrO{sub 2/ phase diagram. A few key results are that (1) capillary forces are only important in beds composed of particles smaller than a few millimeters in diameter and in such beds, melt relocates both upward and downward until it freezes, forming crusted regions above and below the melt zone; (2) as melt flows downward and freezes, a flow blockage forms near the bottom of the bed and the location of this blockage is determined by the bottom thermal boundary layer thickness; (3) the maximum thickness of the lower crust increases linearly with the height of the bed; and (4) deviations from intially uniform composition profiles occur because ZrO_2 is preferentially melted and these deviations decrease as the initial ZrO_2 concentration is increased.

38426 (SAND—87-2467C) Recent fuel-coolant interaction experiments conducted in the FITS [Fully Instrumented Test Site] vessel. Marshall, B.W. Jr. (Sandia National Labs., Albuquerque, NM (USA)). Jan 1988. Contract AC04-76DP00789. 17p. (CONF-880724—10). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88005734/JAW.

From 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference; Houston, TX, USA (24 Jul 1988).

The US Nuclear Regulatory Commission has been sponsoring research at Sandia National Laboratories to investigate the interaction of molten core materials with water. These interactions play an important role during severe core-melt accidents inside a pressurized light water reactor. They influence the rates and magnitudes of hydrogen and steam generated, the characteristics of the debris bed created in the lower plenum after melt-relocation, the transient pressurization of the primary system, and the fission product release characteristics and timimg. Furthermore, since the core

is cooled with water, an understanding of the parameters that control the behavior of these fuel-coolant interactions (FCIs) is necessary to make correct accident-management decisions. In an effort to assist in the understanding of these and other FCI-related issues, as well as provide important data for model development and validation, six FCI experiments were conducted at Sandia. Results discussed include the transient gas-phase pressures, the rate and magnitude of hydrogen generation and the post-test debris characteristics.

36427 **(SAND—88-0011C) Characterization of the internal event frequencies for the final NUREG-1150.** Camp, A.L.; Cramond, W.R. (Sandia National Labs., Albuquerque, NM (USA)). 30 Jun 1988. Contract AC04-76DP00789. 6p. (CONF-880601—7). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88004692/JAW.

From American Nuclear Society annual meeting; San Diego, CA, USA (12 Jun 1988).

NUREG-1150 represents an attempt by the Nuclear Regulatory Commission (NRC) to characterize the risk from a selected group of commercial nuclear power plants. In support of that effort, the NRC is sponsoring the Accident Sequence Evaluation Program at Sandia National Laboratories (SNL) to provide estimates of the internal event core damage frequencies for the Surry, Sequoyah, Peach Bottom, and Grand Gulf power plants. Initial results and the accompanying methodology were published during 1987 in several volumes as NUREG/CR-4550 to support the release of the draft NUREG-1150. The mean core damage frequencies were relatively low, ranging from 8E-6 to 1E-4. As a result of the public comments and various peer reviews, the analyses are being revised to support issuance of the final NUREG-1150 in the late summer of 1988. This paper describes the changes in the sequence frequencies that have occurred, presents the insights that have been obtained from these studies, and identifies certain limitations that still remain.

36428 **(SAND—88-0263C) MELPPROG debris meltdown model and validation experiments.** Dosanjh, S.S.; Gauntt, R.O. (Sandia National Labs., Albuquerque, NM (USA)). Feb 1988. Contract AC04-76DP00789. 19p. (CONF-880724—13). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88006498/JAW.

From 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference; Houston, TX, USA (24 Jul 1988).

The MELPROG computer code is being developed to provide mechanistic treatment of Light Water Reactor (LWR) accidents from accident initiation through vessel failure. This paper describes a two-dimensional (r-z) debris meltdown model that is being developed for use in the MELPROG code and discusses validation experiments. Of interest to this study is melt progression in particle beds that can form in both the reactor core and the lower plenum during severe LWR accidents. Key results are (1) a dense metallic crust is created near the bottom of the bed as molten materials flow downward and freeze; (2) liquid accumulates above the blockage as solid continues to melt and if Zirconium is present, the pool grows rapidly as the molten Zr dissolves both UO_2 and ZrO_2 particles; (3a) if the melt wets the solid, a fraction of the melt flows radially outward under the action of capillary forces and freezes near the radial boundary; and (3b) in a nonwetting system, all of the melt flows into the bottom of the bed. Solutions are qualitatively similar to the post-accident configuration of the Three-Mile Island (TMI-2) core. When the models discussed here are implemented in the MELPROG code, we will be able to conduct a very detailed TMI-2 calculation.

36429 **(SAND—88-0330C) Concrete containment test.** von Riesemann, W.A.; Horschel, D.S.; Clauss, D.B.; Lambert, L.D. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 24p. (CONF-8805117—2). NTIS, PC A03;3. Order Number DE88010520/JAW.

From NRC/MITI technical information exchange workshop; Tokyo, Japan (16 May 1988).

Sandia National Laboratories is conducting a series of research programs whose objective is to develop a suite of validated methods that can be used to predict the response of containment structures when subjected to severe accident loadings. Experiments are being conducted on scale models of containment structures, penetrations, and on sealing materials, such as O-rings. This paper presents the results of the overpressurization test of a 1:6-scale reinforced concrete containment model. The high pressure test was completed on July 29, 1987.

36430 **(SAND—88-0331C) Containment penetrations.** Clauss, D.B.; von Riesemann, W.A.; Parks, M.B. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 22p. (CONF-8805117—1). NTIS, PC A03;3. Order Number DE88010502/JAW.

From NRC/MITI technical information exchange workshop; Tokyo, Japan (16 May 1988).

The performance of LWR containment buildings subject to a severe accident (i.e., an event with loads exceeding the design basis) is an important safety issue. Containment capacity, failure mode, failure size, and failure locations are important measures of containment performance. A systematic evaluation of containment performance requires consideratin of all potential failure modes, which include leakage or failure of penetrations in addition to shell failure of the containment wall. This paper reviews the status of research on the behavior of containment penetrations subject to severe accident loads. Test results and analytical procedures are briefly described, and references that include more detailed discussions are cited where available.

36431 **(SAND—88-1550C) Some uncertainties in radionuclide release during core-concrete interactions.** Williams, D.C.; Powers, D.A.; Shiver, A.W. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 14p. (CONF-8806143—1). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88011491/JAW.

From 2. nuclear reactor severe accident chemistry symposium; Toronto, Canada (5 Jun 1988).

Radionuclides released during core-concrete interactions (CCI) can make a major contribution to the severe accident source term. Despite recent advances in understanding, significant uncertainties remain in the prediction of these releases. In the present paper, selected chemical issues that play an important role are discussed and their impact upon some typical calculations using the CORCON and VANESA codes are evaluated. It is shown that the uncertainty in the oxygen potential of the oxidic phase of the melt can lead to uncertainties of one to over two orders of magnitude in the release fractions for Ba, Sr, La, and Ce. Using La and Ce as examples, it is shown that questions involving speciation in the condensed phase are also capable of affecting the calculated release by one or more orders of magnitude. An activity coefficient model for cerium is introduced which reduces calculated cerium release by up to two orders of magnitude for the accident sequence considered. Some additional chemical issues are examined, including the coking reaction; the effect of the latter on the calculated releases is not large.

36432 **Core assembly storage structure.** Jones, C.E. Jr.; Brunings, J.E. (to Dept. of Energy, Washington, DC). US Patent 4,737,336. 12 Apr 1988. Filed date 4 Apr 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

In a liquid metal-cooled nuclear reactor wherein the reactor core barrel and some auxiliary equipment including core assembly transfer equipment including core assembly transfer equipment are all immersed in a pool of liquid metal within a containment vessel, the reactor including an adjacent structure for the storage of core assemblies from the core barrel, the improvement in the core assembly storage structure is described comprising: an enclosed housing , substantially vertical support members interconnecting the top and bottom plates; an inlet duct in fluid communications with the interior of the housing at one end and having an opposite end in fluid communication with a source of ambient air; an exhaust duct in fluid communication with an opposite wall of the housing and having an opposite end in fluid communication with the atmosphere; thimble members extending through the top plate, support means affixed to the bottom plate and located adjacent a lower end of each of the thimbles.

36433 Fission product iodine and cesium release behavior under light water reactor accident conditions. Collins, J.L.; Osborne, M.F.; Lorenz, R.A.; Malinauskas, A.P. (Oak Ridge National Lab., P.O. Box X, Oak Ridge, TN (US)). *Nuclear Technology;* **81**: No. 1, 78-94(Apr 1988).

The release behavior of the fission products iodine and cesium has been characterized in fission product release tests that have been conducted at Oak Ridge National Laboratory with highly irradiated, light water reactor fuel segments under conditions simulating severe accidents. The chemical forms of the fission products depended on the composition of the carrier gases used in the tests. In purified helium or steam-helium-hydrogen atmospheres, the behavior of the released iodine was characteristic of cesium iodide, whereas that of the cesium, which was not associated with cesium iodide, was characteristic of cesium oxide in the helium atmosphere and of cesium hydroxide in the steam-helium-hydrogen atmosphere. In the dry-air tests, iodine appeared to be in elemental form and cesium in the oxide form. In the steam-helium-hydrogen tests, the released cesium (other than CsI) significantly reacted with and was retained by hot oxidized stainless steel, zirconia, and silica surfaces. In contrast, cesium iodide appeared to be unaffected by these surfaces.

36434 The use of inherent reactivity feedbacks to improve fast reactor availability. Singer, R.M. (Argonne National Lab., EBR-II Div., Building 310, 9700 South Cass Avenue, Argonne, IL (US)). *Nuclear Technology;* **81**: No. 1, 39-51(Apr 1988).

The availability of metal-fueled fast reactors can be improved by the elimination of scrams caused by a class of low-flow events by taking into account the inherent reactivity feedbacks acting during such events. With this approach, the flow signal normally used in the loss-of-flow (LOF) protection system has its trip setpoint substantially reduced, and the power-to-flow signal is used with a normal trip setpoint. This permits the safety system to more closely monitor the safety of the reactor, i.e., its temperature rise as indicated by the power-to-flow ratio, and to avoid the initiation of a scram during an event in which the flow is decreasing but the core temperatures are remaining within prescribed limits. During such events, the inherent feedbacks act to reduce power and thereby limit any temperature or power and thereby limit any temperature or power-to-flow increases despite substantial reductions in the flow. This approach was applied to such an incident in Experimental Breeder Reactor II and was shown to avoid the scram that actually occurred while providing reactor protection. Additional calculations were performed illustrating the range of applicability of this type of LOF protection.

36435 The possibility of local detonations during degraded-core accidents in the Bellefonte nuclear power plant. Sherman, M.P.; Berman, M. (Sandia National Labs., Severe Accident Containment Response Div., Albuquerque, NM (US)). *Nuclear Technology;* **81**: No. 1, 63-77(Apr 1988).

It is possible to objectively determine whether a detonation can propagate in a given geometry (volume shape and size, obstacle configuration, degree of confinement) for a given mixture composition (concentrations of hydrogen, air, and steam); this is done by conservatively equating the detonation propagation criteria with the criteria for transition from deflagration to detonation. To reduce the degree of conservatism in this procedure, estimates of the probability of transition to detonation are constructed, based on subjective extrapolations of empirical data. A methodology is introduced that qualitatively ranks mixtures and geometries according to the degree to which they are conductive to transition to detonation. The methodology is then applied to analyzing the potential for local detonation in the Bellefonte reactor containment for a variety of accident scenarios. Based on code-calculated rates and quantities of hydrogen generation and calculated rates of transport and mixing, this methodology indicates a low potential for detonation except for one volume in a few cases.

36436 Analysis of instrument tube ruptures in the Zion-1 pressurized water reactor. Fletcher, C.D.; Bolander, M.A. (Idaho National Engineering Lab., EG and G Idaho, Inc., Idaho Falls, ID (US)). *Nuclear Technology;* **81**: No. 1, 52-62(Apr 1988).

In Westinghouse four-loop pressurized water reactors (PWRs), many long small-diameter instrument tubes are employed to route flux monitoring instrumentation lines from the lower plenum of the reactor vessel to a flux mapping seal table. A recent safety concern is that a seismic event could hypothetically rupture instrument tubes at the seal table, effectively causing a lower plenum small-break loss-of-coolant accident (SBLOCA). Continued cooling of the reactor core during a SBLOCA requires depressurization of the primary coolant system such that emergency core cooling (ECC) injection flow balances the break flow. For a lower plenum SBLOCA, the break remains liquid-covered, thus retarding primary coolant system depressurization. As a result, for continued cooling of the core, the break must be sufficiently small such that ECC flow balances break flow at elevated pressures. This study investigates instrument tube ruptures at the seal table location. Separate effects analyses investigate instrument tube pressure and heat loss, instrument lines remaining within the tubes, and tube nodalization effects. Systems effects analyses evaluate the significance of the safety concern through a best-estimate, single-failure analysis for the Zion-1 PWR.

36437 Stuck fuel rod capping sleeve. Gorscak, D.A.; Nilsen, R.J.; Maringo, J.J. (to Dept. of Energy, Washington, DC). US Patent 4,732,730. 22 Mar 1988. Filed date 9 May 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A stuck fuel rod capping sleeve is described comprising: an inner cylindrical sleeve made of low work hardening, highly ductile material and having tapered and split end portions; an outer cylindrical sleeve made of moderately ductile material and mounted on the inner cylindrical sleeve, the outer cylindrical sleeve having threads located at each end thereof; and a locking sleeve threaded on each end of the outer cylindrical sleeve, each locking sleeve having threads located on its exterior surface.

36438 Seismic margin reviews of nuclear power plants: identification of important functions and systems. Prassinos, P.G.; Moore, D.L.; Amico, P.J. (Lawrence Livermore National Lab., CA (USA); Energy, Inc., Kent, WA (USA); Applied Risk Technology Corp., Columbia, MD (USA)). *Reliability Engineering and System Safety;* **20**: 263-275(1988).

A study of the results of several seismic probabilistic risk assessments was performed to develop a screening approach for the assessment of the seismic margin of nuclear power plants. This screening approach combines both systems insights and fragility information to simplify the margin review process. The purpose of this paper is to present the basis and method used for the development of the systems screening portion of the seismic margin review methodology.

36439 Oxidation of zircaloy-4 in steam at 1300 to 2400°C. Prater, J.T.; Courtright, E.L. (Advanced Materials Section, Pacific Northwest Lab., Richland, WA 99352 (US)). pp 489-501 of Zirconium in the nuclear industry. Adamson, R.B.; Van Swam, L.F.P. Philadelphia, PA; ASTM (1987). (CONF-850601—).

From 7. international conference on zirconium in the nuclear industry; Strasbourg, France (24 Jun 1985).

The oxidation kinetics of Zircaloy-4 in steam have been extended to 2400°C. Growth of the ZrO_2 and α-Zr(O) layers display parabolic behavior over the entire temperature range studied; however, a discontinuity in the oxidation kinetics above 1510°C causes rates to increase above those previously established by the Baker-Just relationship. This increase coincides with tetragonal-to-cubic phase transformation in ZrO/sub 2-x/. No additional discontinuity in the oxide-growth rate is observed upon melting of Zr(O). The effects of temperature gradients have also been taken into account, and corrected values representative of near-isothermal conditions have been computed. Experiments have been performed in steam-hydrogen mixtures at 1565 and 1815°C. Concentrations of hydrogen up to 90 mol% have no effect on the oxidation kinetics. The rate-controlling factor appears to be the available flux of oxygen atoms incident to the reaction surface and is not dependent upon hydrogen content.

36440 Modular high-temperature gas-cooled reactor (MHTGR) status. Breher, W.; Neylan, A.; Shenoy, A. (GA Technologies Inc., San Diego, CA (US)). pp 1569-1574 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—).

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879274.

The MHTGR is an advanced reactor concept being developed under a cooperative program involving the U.S. Government, the nuclear industry ,and the utilities. The design utilizes basic HTGR features of ceramic fuel, helium coolant, and a graphite moderator. However, the specific size and configuration is selected to utilize the inherent safety characteristics associated with these standard features to develop passive safety systems that provide a significantly higher margin of safety and investment protection than current generation reactors. The design meets the Protection Action Guideline (PAG) limits at the 425 m site boundary, hence precluding the need for evacuation of sheltering of the public during any licensing basis event. The safe behavior is not dependent upon operator action and is insensitive to operator error. The conceptual design is presently being reviewed by the Nuclear Regulatory Commission (NRC). A safety evaluation report and licensability statement are scheduled to be issued by the NRC in January 1988. Status of the design with respect to applications, performance/operation, siting flexibility, investment protection, safety and economics are presented in this paper.

36441 Demonstration of passive safety features in EBR-II. Planchon, H.P. Jr.; Golden, G.H.; Sackett, J.I. (Argonne National Lab., Argonne, Illinois and Idaho Falls, ID (US)). pp 529-535 of Proceedings of the American power conference: Volume 49. Chicago, IL; Illinois Institute of Technology (1987). (CONF-870415—). Contract W-31-109-ENG-38.

From 49. annual American power conference; Chicago, IL, USA (27 Apr 1987).

Two tests of great importance to the design of future commercial nuclear power plants were carried out in the Experimental Breeder Reactor-II on April 3, 1986. These tests, (viewed by about 60 visitors, including 13 foreign LMR specialists) were a loss of flow without scram and a loss of heat sink without scram, both from 100% initial power. In these tests, inherent feedback shut the reactor down without damage to the fuel or other reactor components. This resulted primarily from advantageous characteristics of the metal driver fuel used in EBR-II. Work is currently underway at EBR-II to develop a control strategy and diagnostic technology that promote inherent safety and improved operational characteristics.

36442 CORCON-Mod 2 modifications: Immiscible fluid mixing and fission product vaporization. Corradini, M.L.; Gonzalez, F.; Norkus, J.K. (Dept. of Nuclear Engineering and Engineering Physics, Univ. of Wisconsin-Madison, Madison, WI 53706 (US)). pp 397-405 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

The vaporization of radioactive materials during molten core concrete interactions have been determined to be an important contributor to the radiological source term in the event of reactor containment failure. Recent experiments have indicated that at modest superficial gas velocities (1-30 cm/sec), the melt may be mixed, as opposed to the stratified geometry previously assumed. The mixing of the melt has important implications for not only the heat transfer process within the melt, but also for the calculation of material vaporization and the chemical composition of the melt. Modifications have been made to the CORCON-Mod2 code to consider the mixing of the melt using results of recent experiments using simulant fluids. Also the vaporization of fission products from the melt in either the stratified or mixed configuration is calculated. The internal thermodynamic data base in CORCON has been updated and the ideal chemical equilibrium model is used to calculate the vaporization of core materials. Kinetic effects have been neglected.

36443 Impact of ZR metal and coking reactions on the fission product aerosol release during MCCI. Lee, M.; Davis, R.E.; Khatib-Rahbar, M. (Accident Analysis Group, Safety and Risk Evaluation Div., Dept. of Nuclear Energy, Brookhaven National Lab., Upton, NY (US)). pp 391-396 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

During a core meltdown accident in a light water reactor, molten core materials (corium) could leave the reactor vessel and interact with concrete. In this paper, the impact of the zirconium content of the corium pool and the coking reaction on the release of fission products during Molten Core Concrete Interactions (MCCI) are quantified using CORCONMOD2 and VANESA computer codes. Detailed calculations show that the total aerosol generation is proportional to the zirconium content of the corium pool. Among the twelve fission product groups treated by the VANESA code, CsI, Cs_2O_2 and Nb_2O_5 are completely released over the course of the coreconcrete interaction, while an insignificant quantity of Mo, Ru and ZrO_2 are predicted to be released. The release of BaO, SrO and CeO_2 increase with increased Zr content, while the release of Te and La_2O_3 are relatively unaffected by the Zr content of the corium pool. The impact of the coking reaction of the radiological releases is estimated to be significant; while the impact of the coking reaction on the aerosol production is insignificant.

36444 Investigation of molten corium-concrete interaction phenomena and aerosol release. Spencer, B.W.; Thompson, D.H.; Armstrong, D.R.; Fink, J.K.; Gunther, W.H.; Kilsdonk, D.J.; Sehgal, B.R. (Reactor Analysis and Safety Div., Argonne National Lab., 9700 South Cass Ave., Argonne, IL (US)). pp 375-381 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

The Electric Power Research Institute is sponsoring a program of laboratory investigations at Argonne National Laboratory to study the interaction between molten core materials and concrete, with particular emphasis on measurements of the magnitude and chemical species present in the aerosol releases. The approach is to sustain internal heat generation in reactor-material corium using direct electrical heating. Real reactor materials (UO_2, ZrO_2, oxides of stainless steel, plus metallics) are used, with small amounts of La_2O_3, BaO, and SrO added to simulate nonvolatile fission products. In intermediate-scale scoping tests completed to date, corium inventories of up to 29 kg have been heated with power inputs in excess of 1 kWkg melt. The measured concrete ablation rates have ranged from 0.9 to 3.9 mmminute. Aerosol samples have been examined using a scanning electron microscope and show submicron particles, 2-6 micrometer spheres, and agglomerates that range from a few micrometers to strings 13 micrometers in length.

36445 Experiments related to the resuspension of aerosols during hydrogen burns. Nelson, L.S.; Guay, K.P. (Sandia National Labs., Albuquerque, NM (US)). pp 369-374 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—). Contract AC04-76DP00789.

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

The authors performed seven "add-on" experiments in two large combustion facilities to investigate the capability of hydrogen burns to remove simulated structural fission product aerosols previously deposited on small metal discs that have surfaces protypical of those found in nuclear reactor containments. The authors' results suggest that hydrogen combustion provides an especially effective mechanism for removal (and, presumably, resuspension) of sedimented aerosols produced in a hypothetical nuclear reactor core-degradation or core-melting accident. The presence of condensing steam does not seem to assure adhesion of sedimented aerosols during hydrogen burns. Differences are exhibited between different surfaces as well as between types of aerosol. In-depth studies will

be required to assess the impact exposure of sedimented aerosols to hydrogen burns might have on the radiological source term.

36446 **The parsec computer code for analysis of direct containment heating by dispersed debris.** Sienicki, J.J.; Spencer, B.W. (Reactor Analysis and Safety Div., Argonne National Lab., 9700 South Cass Avenue, Argonne, IL (US)). pp 355-362 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

A multiphase flow and heat transfer, coupled Lagrangian and Eulerian computer program, PARSEC, has been developed to predict the heatup of a gas atmosphere resulting from the gas-driven dispersal of high temperature debris droplets/particles as well as the associated formation of aerosol by the oxidation enhanced vaporization of metal from the surfaces of the droplets, oxidation of reactive debris constituents, and generation of hydrogen. Predictions of the code and the fundamental modeling incorporated therein are in good agreement with available data on the essentially unimpeded dispersal of high temperature melts involving reactor materials in the Argonne CWTI-13 and CWTI-14 experiments as well as iron-alumina thermite in the Sandia DCH-1 test.

36447 **DHCVIM - A direct heating containment vessel interactions module.** Ginsberg, T.; Tutu, N.K. (Brookhaven National Lab., Dept. of Nuclear Energy, Upton, NY (US)). pp 347-354 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

Models for prediction of direct containment heating phenomena as implemented in the DHCVIM computer module are described. The models were designed to treat thermal, chemical and hydrodynamic processes in the three regions of the Sandia National Laboratory Surtsey DCH test facility: the melt generator, cavity and vessel. The fundamental balance equations, along with constitutive relations are described. A combination of Eulerian treatment for the gas phase and Lagrangian treatment for the droplet phase is used in the modeling. Comparisons of calculations and DCH-1 test results are presented. Reasonable agreement is demonstrated for the vessel pressure rise, melt generator pressure decay and particle size distribution.

36448 **Integrated MELPROG/TRAC analyses of a PWR station blackout.** Henninger, R.; Dearing, J.F.; Kelly, J.E. (Safety Code Development, Nuclear Technology and Engineering Div., Los Alamos National Lab., Los Alamos, NM (US)). pp 326-331 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

The first mechanistic analysis of the entire reactor-coolant system during a station-blackout core-meltdown accident has been made with MELPROG/TRAC. As was found in previous standalone MELPROG calculations, natural circulation within the vessel was established shortly after core uncovery. The circulation results in temperatures in the hot leg that could lead to failure and, hence, depressurization long before vessel failure. Auxiliary calculations examined the effects of debris-quenching modeling, natural convection flow around the primary loop, and late emergency core-cooling activation.

36449 **Zircaloy oxidation and hydrogen generation behavior during severe accidents.** Cronenberg, A.W.; Miller, R.W.; Osetek, D.J. (ESA, Inc., 836 Clair View, Idaho Falls, ID 83402 (US)). pp 301-306 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

Zircaloy oxidation and H_2 generation data are presented for recent in-pile severe fuel damage tests. The principal questions investigated concern zircaloy melting and bundle reconfiguration effects on oxidation behavior. A comparison of H_2 generation and cladding temperature data indicate that significant oxidation occurred after the onset of fuel liquefaction. Posttest metallographic observations of the test debris also indicate a high degree of oxidation of once-molten zircaloy. Analysis of bundle reconfiguration effects indicate that essentially complete flow area blockage (>98%) would be required to retard steam flow through the degraded bundle so as to diminish H_2 production. Such extreme blockage conditions are not supported by posttest bundle examination.

36450 **Stability of zircaloy oxidation during severe LWR accidents.** Kuan, P. (Idaho National Engineering Lab., EG and G Idaho, Inc., P.O. Box 1625, Idaho Falls, ID 83415 (US)). pp 297-300 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—). Contract AC07-76ID01570.

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

The stability of zircaloy oxidation by steam at high temperatures under certain light water reactor (LWR) accident conditions is examined. When the oxidized surface radiates through a thin layer of steam to a cool heat sink, such as cooling water, it is found that the oxidation if stable, in the sense that no temperature escalation occurs due to the exothermic reaction, if (a) the temperature is below 1850 K (3330°R) and the zircaloy has been oxidized to a depth of about 15μm (5.9×10^{-4} in.), or (b) the zircaloy has been oxidized to a depth of 67 μm (2.6×10^{-3} in.), regardless of temperature.

36451 **Experimental and analytical studies of passive shutdown heat removal systems.** Pedersen, D.; Tessier, J.; Heineman, J.; Stewart, R.; Anderson, T.; August, C.; Chawla, T.; Cheung, F.B.; Despe, O.; Haupt, H.J. (Argonne National Lab., 9700 South Cass Avenue, Argonne, IL (US)). pp 145 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

A naturally circulating air stream to remove decay heat from a nuclear reactor is a key feature of advanced liquid metal reactor concepts. General Electric and Rockwell International continue to develop innovative designs aimed at improving safety and enhancing plant licensability. Argonne National Laboratory provides technical support to both. Shutdown heat removal employs a passive system that rejects heat by radiation and natural convection to air to assure adequate cooling. Although calculations indicate viability of this system, uncertainties remain with respect to particular designs, changing environmental conditions and material properties. Needed data are gathered in a facility that stimulates a full-scale segment of the reactor system.

36452 **Transient non-equilibrium two-phase flow: reflooding of a heated vertical tube under controlled oscillation inlet flow conditions.** Ng, Y.S. Berkeley, CA; Univ. of California (1986). 334p. University Microfilms Order No. 87-18,103.

Thesis (Ph. D.).

Flow oscillations have been observed in large-scale reflood experiments and are believed to significantly affect the rate of core recovery following a loss-of-coolant accident (LOCA). This work studies the effects of flow oscillations on heat transfer during oscillatory reflooding of a vertical heated tube and the nature of the resulting flow regime occurring along the flow channel. Experiments were performed using the UCB Reflood-Forced Oscillation Test Facility, which basically consisted of a test loop and associated instrumentation, data acquisition system, gamma densitometer, 30-kV power supply, oscillator, feed water supply, and data logging devices. Tests with a variety of boundary conditions all indicated that the overall tube quenching was delayed by the presence of the flow oscillations. A numerical model was developed to simulate the fast reflood runs (in which inverted annular flow occurred during upstroke). The two-fluid representation approach was quite successful in analyzing the given flow system. The present single-tube reflood model is mainly used to interpret the UCB oscillatory reflood data

as well as to elucidate the fundamental aspects of flow and heat-transfer phenomena existing in the oscillatory reflood process.

25 ENERGY STORAGE

36453 **(PB—88-933401) Energy Storage Systems: A current awareness bulletin.** Williams, L.E. (ed.). (USDOE Office of Scientific and Technical Information, Oak Ridge, TN). Feb 1988. 27p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008288/JAW.

Energy Storage Systems (EST) announces on a bimonthly basis the current worldwide information available on all aspect of energy storage. This publication contains the abstracts of reports, journal atricles, conference papers, patents, theses, and monographs added to the Energy Data Base (EDB) during the past two months.

36454 **(AD-A—190196/6/XAB) Repetitive opening switches using optically activated semiconductors. Final technical report, 1 September 1984-31 August 1987.** Lee, C.H.; Rhee, M.J. (Maryland Univ., College Park (USA). Dept. of Electrical Engineering). 1 Oct 1987. 58p. NTIS, PC A04/MF A01.

This is the final technical report for a research program to study repetitive opening switches using optically activated semiconductors. This program was funded by the Air Force Office of Scientific Research for the period September 1, 1984 to August 31, 1987 under Grant No. AFOSR-84-0359. The goal of the research was to study opening-switch characteristics of various semiconductors in conjunction with inductive energy-storage systems.

36455 **(CRIE-U—87009) Survey on the civil engineering problems concerning the super-conducting magnetic energy storage (SMES).** Shin, Koichi; Kanazu, Tsutomu; Hibino, Satoshi. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jul 1987. 29p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752543/JAW.

Previously published data are examined, selected and classified to identify major civil engineering technology requirements for the design and construction of facilities for superconducting magnetic energy storage (SMES). In a SMES system, an electromagnetic stress is generated in the outward direction along the coil radius. When installed in an underground cavity with a diameter of 200-500 m, it exerts a force to the external material, which changes in a one-day cycle in the range from several 10s to 100kgf/cm^2. And the rock around the cavity suffers from low temperatures because of the cooling of the system. Thus a study is required to determine the fatigue characteristics of the rock and construction materials exposed to long-period cycles of low-range temperature change. The coil should be rigid enough to avoid displacement, because superconductivity cannot be maintained if the coil undergoes an excessive strain. An analysis should be carried out, therefore, to determine the behaviors of the cavity and coil under an electromagnetic stress and during an earthquake. The effects of daily changes in magnetic field on rock, construction materials and environment have not been clarified yet. There remain problems concerning induced electric current and electrochemical corrosion. It is also necessary to develop construction methods and supporting materials that are resistant to large stresses. (4 figs, 8 tabs, 35 refs)

36456 **(BFR-R—88-1986) Aquifer heat store in a gravel deposit at the southern end of Brunnsviken. A feasibility study.** Eriksson, A.; Melin, O. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 35p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752893/JAW.

This investigation has looked at the feasibility of providing seasonal storage of low-temperature water (maximum 20 degrees C) in a gravel deposit at the southern end of Brunnsviken in Stockholm. Heat would be recovered using a heat pump to raise the temperature to a suitable level for space heating and domestic hot water supply. The same heat pump would be used during the summer to provide cooling, thus recharging the store with heat and cold on a six-monthly cycle basis. If the cooling capacity is insufficient for recharging the heat store, additional heat could also be supplied by heat change with the warm surface water from Brunnsviken during the summer. A number of larger buildings, having both heating and cooling requirements, lie within the area. The total annual heating requirement has been estimated as amounting to 17 GWh and the corresponding cooling requirement to 4 GWh. The greatest volume of gravel, and therefore the maximum storage capacity, lies to the north of Sveaplan. Total storage potential is estimated as amounting to 5-10 GWh with reasonable temperature levels. The Wenner-Gren Centre and the Sveaplan Higher Secondary School are therefore felt to offer the best prospects for utilising the gravel as a heat store. (authors).

36457 **(BFR-R—90-1986) Signal analysis for design rating of heat stores.** Simonsson, B.; Svedinger, B. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 67p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752895/JAW.

Correctly rated and utilized heat stores provide considerable scope for improving the efficiency of energy systems for supply of heating energy to build environments. Thus, for example, the use of a heat store can reduce the need for installed peak load capacity in a production system and help to optimize the form of energy used, energy price variations and so on. This report describes a newly-developed method of applying signal analysis to measured consumption data to allow calculation of, for example: - reduction of installed peak load capacity, - required store size for various operating strategies, - required store output power, - savings associated with varying energy prices. The method can also be used to simulate and illustrate the performance of the store in relation to design temperature variations, assumed energy prices and operating strategies. The applicability of the method developed has been documented using measured data from an experimental building project at the Instrumentation Center at the Royal Institute of Technology in Stockholm. Its engineering applications is illustrated in an example from a smaller district heating system. The report also includes proposals for a number of development projects with aim of testing and further developing the method for applications within the field of electrical energy and water supply systems, as well as for industrial processes. (authors).

36458 **(BFR-R—92-1986) Energy storage in clay. A new method for construction ground heat exchangers.** Engvall, L. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 18p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752897/JAW.

One method of storing energy involves sensible heat storage in a body of clay. The necessary temperature changes in the clay are effected by means of a system of vertical heat exchanger pipes driven down into the ground, and through which a hot or cold liquid circulates, heating or cooling the clay. This project has been concerned with a test of a new method for installation of the heat exchanger pipes. The method involves the use of relatively light-weight equipment with which the hoses are pressed down into the ground. The equipment that has been used is similar to a hydraulic drilling rig as normally used for geotechnical investigations. The work has involved: - development of the necessary tools, - determination of the necessary press force and the possible depth to which the tools can be driven in clays of varying strenghts, - capacity testing. The trials indicate that the method is suitable where the ground consists of loose clay with a shear strength not exceeding about 20 kPa. For these conditions, the maximum depth to which the pipes can be driven is about 20 m. Stronger soil or greater driving depths require the drilling rig to be anchored, resulting in its capacity probably being too low to allow the method to be feasible.

36459 **(EUR—10614-EN/I-II) Solar assisted absorption or motor driven heat pump with earth seasonal storage. Final report. Pt. 1 and 2.** Lazzarin, R.M. (Commission of the European Communities, Luxembourg. Directorate General Telecommunications, Information Industries and Innovation). 1987. 185p. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Energy.

A plant composed of an energy roof, a seasonal earth storage and an absorption heat pump has been experimented. The purpose was to study the behaviour of the various components and their interaction. The surveys went on during two years. The following operations are considered: The charging of the earth storage by the energy roof and the working of an absorption heat pump connected either to the energy roof or to the earth storage.

36460 **(NEI-DK—78) Finite element method for heat and mass transport in porous structures ; Mathematical formulation and numerical techniques for program D2AQ.** Reffstrup, J.; Wuertz, J. (Danmarks Tekniske Hojskole, Lyngby. Lab. for Energiteknik; Danmarks Geologiske Undersoegelske, Copenhagen; Risoe National Lab., Roskilde (Denmark)). Nov 1982. 69p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753333/JAW.

The D2AQ model is designed primarily for the solution of coupled heat and mass transport in porous media. The finite element method has been used as numerical method in the model, that is, the finite element method is used in the spatial discretization of the problem, whereas the finite difference method is used to advance the solution in time. The model is still under development and new options are being added. In the present version the model has been used primarily to analyse how flow conditions in the aquifer are dependent on the boundary conditions used in the solution, (i.e. changes in filter settings, changes in injection temperature, etc.). The model can be used for the solution of related problems that can be described by the same mathematical formulation as mass and heat transfer problems, such as transport of solutes in porous structures and salt water intrusion. (SM).

36461 **(NEI-FI—22) Mine cavern used for heat storage in a district heating system.** Vartiainen, O.; Kilpinen, E.; Englman, T.; Lindevall, J.; Sipilae, K. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). Feb 1987. 65p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752837/JAW.

A research program to utilize waste energy by storing it in the form of heated water in a mine cavern was carried out at Tyryrin Kalkkitehdas (Tytyri Lime Factory) owned by Oy Lohja Ab. The goal was to work out a suitable technical application to utilize the existing subsurface mine cavern for heat storage and to study the feasibility of various technical alternatives taking into account also the recovery of heat content of the compressors' cooling water. The storage of heated water would be accomplished at high temperature conditions, viz. between 100-55 deg C. The storage would be linked with the district heating net through at heat exchanger. Technically the existing mine cavern can be changed to the storage of heated water fairly easily. The upper part of the storage cavern the total volume of which being 245 000 cu. meter is well suitable for the purpose. Depending in the amount of heat energy being available for storage the effective water volume of ab. 63 000-88 000 cu. m is needed. As mentioned above this effective part of the storage could be located in the upper part of the excavation. The future growth of the local district heating capacity will play a very important role in the realization of the heat storage at Tyryri Plant. A strong increase of the net's heat consumption will make it possible to feed more heat directly from the heat recovery plant into the net thus less heat being left for storing.

36462 **(ORNL/TM—10715) Thermal energy storage technical progress report: April 1986-March 1987.** Tomlinson, J.J.; Taylor, M.J. (Oak Ridge National Lab., TN (USA)). Feb 1988. Contract AC05-84OR21400. 58p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010753/JAW.

Progress in the development of Thermal Energy Storage (TES) technology under the Oak Ridge National Laboratory TES Program for the period April 1986-March 1987 is reported. Program goals and project structure are presented. Each of the projects active during this report period is discussed, and the interrelation of specific projects toward major technology transfer activities is described.

36463 **(ORNL/TM—10719) Transient thermal analysis of three latent heat storage configurations for rapid thermal charging.** Stovall, T.K. (Oak Ridge National Lab., TN (USA)). 28 Jun 1988. Contract AC05-84OR21400. 72p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88008943/JAW.

A space-based thermal storage applicaton must accept large quantities of heat in a short period of time at an elevated temperature. An approximate model of a lithium hydride phase change energy storage system was used to estimate reasonable physical dimensions for this applicaton which included the use of a liquid metal heat transfer fluid. A finite difference computer code was developed and used to evaluate three methods of enhancing heat transfer in the PCM energy storage system. None of these three methods, inserting thin fins, reticulated nickel, or liquid lithium, improved the system performance by a significantly large amount. The use of a 95% void fraction reticulated nickel insert was found to increase the storage capacity of the system slightly with a small decrease in the system energy density. The addition of 10% liquid lithium was found to causes minor increases in both storage density and storage capacity with the added benefit of reducing the hydrogen pressure of the lithium hydride. 18 refs., 23 figs., 9 tabs.

36464 **(PNL-SA—15441) Potential energy storage from aquifer thermal energy storage.** Anderson, M.R.; Weijo, R.O.; Smoot, J.L. (Pacific Northwest Lab., Richland, WA (USA)). Nov 1987. Contract AC06-76RL01830. 14p. (CONF-880212—8). NTIS, PC A03;3. Order Number DE88009482/JAW.

From 15. annual energy technology conference and exposition; Washington, DC, USA (17 Feb 1988).

Aquifer thermal energy storage (ATES) is a technology that allows energy to be stored in aquifers and retrieved when needed. With this technology, energy is transferred to and from an aquifer through a network of wells. The aquifer operates as a containment vessel that permits very little loss of stored energy. From 50% to 90% of the energy transferred to the aquifer can be recovered for use in space heating and cooling or as process heat. This paper summarizes a study conducted for the US Department of Energy's ATES Program. Pacific Northwest Laboratory conducted the study to estimate the overall potential energy savings from ATES utilization in the US. This estimate included the potential short- and long-term savings from both heating and cooling applications of ATES. The results can be used in determining the direction of research conducted on ATES, specifically whether the primary focus of research should be on heat or chill storage, and which end markets are the primary users and sources of heat or chill ATES.

36465 **(SAND—87-3061C) Prediction of velocity and temperature profiles in thermally driven gravity currents applied to stratified thermal storage tanks.** Nakos, J.T.; Wildin, M.W. (Sandia National Labs., Albuquerque, NM (USA); New Mexico Univ., Albuquerque (USA). Dept. of Mechanical Engineering). 1988. Contract AC04-76DP00789. 27p. (CONF-880716—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88004452/JAW.

From 1. national fluid dynamics congress; Cincinnati, OH, USA (24 Jul 1988).

It has been demonstrated that one way of producing thin thermoclines in a chilled water thermal storage tank is by introducing the fluid in the form of a gravity current. Early in the flow the gravity current is controlled mainly by inertia and buoyancy forces, producing what is called the inertia-buoyancy (I-B) regime. Subsequently, the viscous force dominates inertia, and the flow is governed by viscous and buoyancy forces, resulting in the viscous-buoyancy (V-B) regime. In the work to be reported, vertical profiles of velocity and temperature in two-dimensional, thermally driven, constant inflow gravity currents were studied. This was done to provide a basis for understanding the initial stages of the formation of a thermocline. The gravity current was modelled with

three regions, the head, the main body and the mixed region. In this analysis, the head was ignored and a laminar flow model was used to predict velocity and temperature profiles in the main body near the floor and in the mixed region above the main body and behind the head. Analytical and numerical models were developed for both regimes. Major features of the I-B regime temperature above the floor to an elevation roughly equal to the top of the inlet diffuser opening and a high gradient region above the top of the inlet opening. Velocity profiles in the I-B regime velocity profiles and also higher gradients above the top of the inlet opening than those in the V-B regime. 6 refs., 8 figs.

36466 **Encapsulated sink-side thermal energy storage for pulsed space power systems.** Foote, J.P.; Morris, D.G.; Olszewski, M. (Oak Ridge National Lab., Oak Ridge, TN 37831 (US)). pp 1940-1945 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—). Contract AC05-84OR21400.

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879184.

Inclusion of thermal energy storage in a pulsed space power supply will reduce the mass of the heat rejection system. In this mode, waste heat generated during the brief high-power burst operation is placed in the thermal store; later, the heat in the store is rejected to space via the radiator over the much longer nonoperational period of the orbit. Thus, the radiator required is of significantly smaller capacity. A candidate design for the thermal energy storage component utilizes lithium hydride encapsulated in 304L stainless steel or molybdenum in a packed-bed configuration with a lithium or sodium-potassium (NaK) heat transport fluid.

Electrolyte tubes have been fabricated from some high-soda glasses in the Na_2O-ZrO_2-Al_2O_3-SiO_2 system. Using these tubes, small-scale Na/S cells have been built and tested. Test results are presented, as a by-product of the sodium-ion-conducting-glass work, a miniature reference electrode/sensor with high-soda glass membrane has been developed. The reference electrode/sensor has been used to measure thermodynamically defined sodium activity for the temperature range of 100-600°C in many different electrochemical systems.

36468 **(CONF-8806127—7) Post-test observations on CSPL cells.** Smaga, J.A.; Marr, J.J. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011975/JAW.

From 7. DOE/EPRI beta battery workshop; Toronto, Canada (1 Jun 1988).

The sulfur electrode from Chloride Silent Power Limited (CSPL) sodium/sulfur cells has been extensively studied as one part of our post-test analysis program at Argonne National Laboratory (ANL). The sulfur in electrodes from charged cells tended to settle in the base of the electrode, but this tendency was dependent on the density of graphite fibers in the cylindrical section of the electrode. Analysis by energy dispersive spectroscopy was used to measure polarization-induced compositional gradients for rapidly cooled discharged cells. Quantitative determinations were also made of the gases within the sulfur electrode, and the composition of these gases was found to change with cycling.

36469 **(LBL—25253) Estimation of power-energy plots for secondary batteries.** McLarnon, F.R.; Cairns, E.J.; Landgrebe, A.R. (Lawrence Berkeley Lab., CA (USA); USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC. Office of Energy Storage and Distribution). May 1988. Contract AC03-76SF00098. 12p. (CONF-880665—3). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011922/JAW.

From 33. international power source symposium; Cherry Hill, NJ, USA (13 Jun 1988).

A fast convenient method for estimating power plots for galvanic cells is discussed. Comparisons between various electrochemical couples can be made with this method, along with the evaluation of different cell designs, and parameters, such as sustained peak power, can be estimated.

36470 **(SAND—88-1321C) Component stress during freeze/thaw cycling.** Braithwaite, J.W.; Subia, S.R.; Stone, C.M.; Hammetter, W.F. (Sandia National Labs., Albuquerque, NM (USA)). 23 May 1988. Contract AC04-76DP00789. 21p. (CONF-8806127—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011204/JAW.

From 7. DOE/EPRI beta battery workshop; Toronto, Canada (1 Jun 1988).

During the past year, the feasibility and usefulness of mathematically modeling the processes occurring in Na/S cells during freeze/thaw (F/T) cycling has been demonstrated with the identification of potential stress producing phenomena. The first strain measurements on functioning cells have been completed that have shown the variable nature of the positive-electrode materials, a factor that may account for the randomness of actual F/T induced failures. Physical property measurements have quantified the important effect the presence of the graphite felt can have on Young's modulus for sulfur. With the completion of the physical-property and strain measurements in the coming year, final modification will be made to the material models contained in the thermo-mechanical code. The strain data will be used to validate the accuracy of the component stress calculations. Once validated, this code can be used to identify and simulate important aspects of various design options and to determine the feasiblity of proposed failure mechanisms. 4 refs., 10 figs., 1 tab.

36471 **(SAND—88-1322C) Effect of thermal cycling on CSPL [Chloride Silent Power Ltd.] sodium/sulfur cells.** Braithwaite, J.W.; Stackpool, F.M.; Subia, S.R.; Stone, C.M. (Sandia National Labs., Albuquerque, NM (USA); Chloride Silent Power Ltd., Runcorn (UK)). 23 May 1988. Contract AC04-76DP00789. 20p. (CONF-8806127—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011205/JAW.

From 7. DOE/EPRI beta battery workshop; Toronto, Canada (1 Jun 1988).

The initial phase of a task being performed to improve the freeze/thaw (F/T) durability of CSPL cells has been completed. Extensive experimental testing along with preliminary thero-mechanical modeling results show that intrinsic F/T durability of the CSPL-PB cell design is excellent. Additionally, the therom-mechancial modeling claculations demonstrated that the PB design may be more tolerant to undesirable conditions than conventional, higher capacity cells with larger L/D ratios. However, the results following thermal cycling of the intial battery modules that were fabricated at CSPL were not as encouraging. F/T failure increased significantly over that observed in individual cell tests. This situation may have been caused by other factors (e.g. cell production rate scale-up, poor temperature uniformity) and may not represent the inherent durability of the modules. Future activity includes characterizing cell performance in modules, completing the detailed evaluation of cell behavior, and refining the thero-mechanical model.

36472 **(SAND—88-1324C) Considerations and measurements of latent-heat-storage salts for secondary thermal battery applications.** Koenig, A.A.; Braithwaite, J.W.; Armijo, J.R. (Beta Power, Inc., Wayne, PA (USA); Sandia National Labs., Albuquerque, NM (USA)). 16 May 1988. Contract AC04-76DP00789. 21p. (CONF-8806127—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011091/JAW.

From 7. DOE/EPRI beta battery workshop; Toronto, Canada (1 Jun 1988).

Given its potential benefits, the practicality of using a latent heat-storage material as the basis for a passive thermal management system is being assessed by Chloride Silent Power Ltd. (CSPL) with technical assistance from Beta Power, Inc. and Sandia National Laboratories (SNL). Based on the experience gained in large-scale solar energy storage programs, fused salts were selected as the primary candidates for the heat-storage material. The initial phase of this assessment was directed to an EV battery being designed at CSPL for the ETX-II program. Specific tasks included the identification and characterization of potential fused salts, a determination of placement options for the salts within the battery, and an assessment of the ultimate benefit to the battery system. The results obtained to date for each of these tasks are presented in this paper.

36473 **(SAND—88-7093C) Recent developments in nickel hydrogen technology.** Beauchamp, R.L.; Dunlop, J.D. (Johnson Controls, Inc., Milwaukee, WI (USA); COMSAT Labs., Clarksburg, MD (USA)). 1988. Contract AC04-76DP00789. 9p. (CONF-880665—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011248/JAW.

From 33. international power source symposium; Cherry Hill, NJ, USA (13 Jun 1988).

A program to design and develop a multikilowatt-hour nickel hydrogen battery for storing electricity from photovoltaic or other power sources is continuing under a cost sharing contract with Sandia National Laboratories. The challenge has been to dramatically reduce the first-cost of the battery to make it economically competitive, on a life-cycle cost basis, with other energy storage batteries used in terrestrial applications. The advantages offered by nickel hydrogen batteries are: (i) a long cycle life, (ii) no maintenance, and (iii) a high tolerance to abuse (2). The last characteristic is possibly the most important. It implies that there is no need for a charge controller between the solar array and the battery. This would have a beneficial effect on the installation's long term reliability and cost. It also means that one can take full advantage of the maximum output of the solar array, in contrast to systems where the controller isolates the battery during times of maximum insolation. Couple this to the battery's excellent energy efficiency and there can be a significant reduction in the size of the array. In addition, since the state-of-charge is directly related to pressure, the battery can be used as a load management system. 4 refs., 4 figs.

36474 **Electrochemical system including lamella settler crystallizer.** Maimoni, A. (to Dept. of Energy, Washington, DC). US Patent 4,735,872. 5 Apr 1988. Filed date 18 Nov 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

In an electrochemical system including a cell stack, an electrolyte storage/reaction chamber means, means for circulating electrolyte from the storage/reaction chamber means, through the cell stack, and back to the storage/reaction chamber means, and means for removing solid reaction products produced in the cell stack from the electrolyte, the improvement is described comprising: the means for removing solid reaction products comprising: a lamella settler crystallizer operatively connected to the electrolyte storage/reaction chamber means, the crystallizer being positioned at an angle with respect to horizontal; means for circulating electrolyte from the storage/reaction chamber means, through the crystallizer, and back to the storage/reaction chamber means; and means operatively connected to the crystallizer for collecting products separated from the electrolyte as it passes through the crystallizer.

29 ENERGY PLANNING AND POLICY

36475 (CONF-8603244—, pp 49-65) **Energy situation in the Federal Republic of Germany and the world.** Maack, J. (Bundesverband der Energie-Abnehmer e.V. (VEA), Hannover (Germany, F.R.)). Mar 1986. (In German). NTIS (US Sales Only), PC A10. Order Number DE88770211/JAW.

From VDI-ADT annual meeting on better utilization of raw materials and energy in the textile industry; Reutlingen, F.R. Germany (14 Mar 1986).

A short report about energy consumption in the Federal Republic of Germany is followed by some remarks on the situation on the sectors mineral oil, natural gas coal and electric energy. The explanatory figures of the annex are based on figures collected until 1985.

2901 Energy Analysis And Modeling

REFER ALSO TO CITATION(S) 36483, 36503, 36519

36476 **(EMR/OEC—RR6) Energy analysis: methods, uses, implications. A review and critique of the state-of-the-art.** Winstanley, G. (Department of Energy, Mines and Resources, Ottawa, Ontario (Canada). Office of Energy Conservation). Feb 1976. 84p. (CE—01488). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

Energy analysis is concerned with tracking physical flows of energy through the economic production system. Energy prices may not adequately reflect all the costs (environmental, social, private, intergenerational) which should ideally be considered in making decisions regarding the appropriate use of energy resources. Energy analysis, often descriptive rather than evaluative, provides additional physical information upon which normative policy descisions can be based. This paper sets out the methodological approaches which may be taken, their limitations and associated problems, and the conventions which have come to be associated with the discipline. A compete bibliography is appended. Since energy is a ubiquitous and possibly limitational factor of production, current concerns about energy price and availability have pushed the subject of energy analysis into a prominent position. An initial oversell of the technique's potential has led to the incorporation of references to energy analysis in political documents and even in law before either the methodological or philosophical questions regarding its use and implications have been carefully evaluated. It seems clear that energy analysis and its applications to policy development should still be regarded as an exploratory technique; any real assessment of its usefulness must await empirical evidence. While there is a recognition of the importance of energy as a physical input to economic activity, its relative importance among the other factors which enter the evaluation process has yet to be determined in the context of social priorities. 52 refs., 3 figs.

36477 **(IKE-K—54-17) Estimate of the energy consumption of private households in Baden-Wuerttemberg.** Klaiss, H.; Scheirle, N. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme). Apr 1980. 137p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88753371/JAW.

The energy consumption of the private households and small consumers has had an ascending share of the total energy consumption in the last years. It is today nearly 50%. The existing energy statistics preponderantly prove no different amounts for both parts of the sector. The study in hand only refers to the private households. At first the past consumption is analysed. From 1960 to 1974 the consumption has approximately trebled, and now (1974) amounts to 7.602×10^3 t SKE. Striking is the big increase of oil and the high share for space-heating (80%). On the basis of the analysis a dynamic model is built up. By doing so, two scenarios are calculated. In the reference-scenario a further increase of consumption is computed up to 10.588×10^3 t SKE for the year 2000. The electric household effects then prove the highest increase. In the saving

variant 'off the oil' a maximum of $8.912x10^3$ t SKE results in the year 1985.

36478 **(LBL—22586) Energy assessment of Ivory Coast, Morocco, Nigeria, and Senegal.** Ghirardi, A.; Sathaye, J.; Goering, P. (Lawrence Berkeley Lab., CA (USA)). Nov 1986. Contract AC03-76SF00098. 38p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88008420/JAW.

This report is an overview of the energy market in four West African countries: The Ivory Coast, Morocco, Nigeria, and Senegal. We feel these countries are representative of the West African region. Together they account for 75% of the total energy use in West Africa, 78% of GDP, and 76% of population. The purpose of the study is to analyze the evolution of energy demand in the context of the general socio-economic background of the region. The study also examines energy supply and trade related to the energy sector. The analysis focuses on the study of commercial fuels. Although we have reviewed studies of wood, solar, wind, and agricultural residues, we leave out detailed discussions of these non-commercial energy forms. The first part of the report is an assessment of the trends in energy demand in the four study countries. We discuss the main factors driving energy demand sector by sector. This is followed by a review of the primary energy resources of the countries, and of the capacity for production of secondary fuels. The last section looks at energy trade, with particular emphasis on the role of the United States.

36479 **(BFR-D—25-1986) Effects of state support on industry and on the market for solar heating, heat pumps and heat storage.** Isacson, Oe.; Ewetz, J.; Lundgren, G. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 57p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752880/JAW.

The objective of this investigation has been to study in detail the effects of State energy research, development and demonstration support on industry and the market for solar heating, heat pumps and heat storage. Particular attention has been paid to demonstrating direct results from various forms of State support, and to investigating whether better results could be obtained in the future through any change to the form of support. State energy research, development and demonstration support is regarded as having been wholly decisive for technological development within the solar heating and large-scale heat storage sectors. Within the heat pump sector, State energy research, development and demonstration support and market introduction support have accelerated the market and also created markets within certain niches which the manufacturers themselves would not have been able to exploit. Indirect support in the form of training and courses at institutes of technology and universities, special courses, etc. has played an important part in establishing knowledge in all areas of the three energy technologies. Examples exist today within the solar heating sector of commercial components that have been developed with the help of State R and D support, and commercial systems are now starting to be built in the heat storage sector using a technology that has been developed in State-supported projects. (authors).

The text of the presentation speech is presented which reviews A.H. Benade's career since 1952. (PSB)

36481 **(DOE/EA—0101) Environmental assessment of the proposed Solar Energy Research Institute facility at South Table Mountain, Jefferson County, Colorado.** (Solar Energy Research Inst., Golden, CO (USA)). 5 Feb 1980. Contract AC02-83CH10093. 163p. NTIS, PC A08;3. Order Number DE88008859/JAW.

In compliance with NEPA, this environmental assessment report examines the potential environmental impacts of constructing and operating the proposed Solar Energy Research Institute (SERI) facility at South Table Mountain, Jefferson County, Colorado. It describes the proposed office/laboratory building, testing sites and support facilities, characterizes the existing baseline environmental setting, assesses potential impacts of implementing the proposed plan, and examines reasonably available alternatives.

36482 **(PNL-SA—15690) Federal laboratories: what kind of economic impact can the region expect?.** Mohler, B.L.; Harrer, B.J.; Garrett, B.A. (Pacific Northwest Lab., Richland, WA (USA)). May 1988. Contract AC06-76RL01830. 19p. (CONF-8804149—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011900/JAW.

From 22. annual Pacific Northwest economic conference; Boise, ID, USA (28 Apr 1988).

The objective of this paper is to discuss the ability of DOE and its laboratories, to impact regional economic development while addressing national needs through the mobilization of federal resources. It has become clear that an important and enduring responsibility of DOE and its laboratories should be to ensure that the results of federal research, whether in the form of knowledge or technology, are in fact, utilized in ways which foster industrial competitiveness on a global scale.

36483 **(RISO-M—2665) Inclusion of uncertainty in economic assessments of energy technologies.** Nielsen, L.H. (Risoe National Lab., Roskilde (Denmark)). Jun 1987. 167p. (In Danish). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88752928/JAW.

The report presents a study for taking uncertainties into account in economic assessments of energy technologies. The study has been carried out for the Nordic Council of Ministers and the Danish ministry of Energy. Probabilistic calculations and sensitivity analyses are utilized to give an overall picture of the uncertainties involved. Probability distributions on key quantitites such as levelized cost of energy in difference project assessments are calculated using Monte Carlo simulation. Calculations are performed on private and national economic basis. Employment and import effects can be taken into account. Calculations are based on detailed data for the various components and employment and import coefficients. Assumptions on overall shadow prices can enter the calculations. The approach allows all data to be stochastic variables, and stochastic interdependencies can be included. A conceptually simple procedure for stating empirical or subjective correlations in data is used. Furthermore, a facility for stating assumptions on uncertainty of fuel price forecasts has been developed. Sensitivity analyses describe the influence from individual data distributions and stochastic fuel price forecasts on the calculated overall uncertainty, and thus point out major and minor risk contributing factors. When possible a graphical presentation of data and results is chosen. The graphical presentation seems natural when displaying probabilistic information and helps to overview often many interacting uncertain quantities in the analysis. This forms an information platform upon which the decision maker can apply his basic criteria of decision. A number of examples illustrating the model developed (MUSA) are included in the report. The aim of the study has been to construct a tool for e.g. energy planners, where uncertainty aspects can be handled in a straight forward and practical way.

36484 (EUR—10633) State of the environment in the European Community 1986. (Commission of the European Communities, Luxembourg). 1986. 370p. Commission of the European communities, Luxembourg.

The report on the state of the environment in the European Community (1986) shows - within the limits of the available information - how the environment (in the Community of ten Member states) has changed in recent years, particularly in the period since the adoption of the first Community Environment Programme. It follows two earlier reports published by the Commission in 1977 and 1979, linking the state of the environment with the development of the Commission's activities in the environmental field. The present report fulfils an undertaking given by the Commission to the European Parliament to develop an information base which can improve understanding both of changes in the Community environment, and the effects of Community policies, in the environmental field and also in other areas with an impact on the environment.

36485 (IIUG-pre—87-9) Danger aversion - prevention - structural ecological orientation. Three ideal types of environmental policy. Prittwitz, V. (Wissenschaftszentrum Berlin fuer Sozialforschung gGmbH (WZB) (Germany, F.R.). Internationales Inst. fuer Umwelt und Gesellschaft). 1987. 25p. (In German). Wissenschaftszentrum Berlin fuer Sozialforschung g.G.m.b.H. (WZB) (Germany, F.R.). Internationales Inst. fuer Umwelt und Gesellschaft.

The author analyzes three ideal types of political environmental action - danger aversion, prevention, and structural ecological orientation. These types compete, yet can also complement or mutually strengthen one another. Preventative environmental policy is thus not necessarily a synonym for good environmental policy. In its historical framework and with certain conditions under which it has an optimal effect, preventative environmental policy is merely one part of the system of political environmental action.

36486 (ORNL—6450/R3) Environmental Sciences Division environmental regulatory update table. Langston, M.E.; Nikbakht, A.; Salk, M.S. (Oak Ridge National Lab., TN (USA)). Mar 1988. Contract AC05-84OR21400. 108p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88008951/JAW.

Environmental Sciences Division Publication No. 3054.

The Environmental Regulatory Update Table provides information on regulatory initiative so interest to DOE operations and contractor staff with environmental management responsibilities. The table is updated each month with information from the Federal Register and other sources, including direct contact with regulatory agencies. Each table entry provides a chronological record of the rulemaking process for that initiative with an abstract and a projection of further action.

36487 (ORNL—6450/R4) Environmental Sciences Division environmental regulatory update table. Langston, M.E.; Nikbakht, A.; Salk, M.S. (Oak Ridge National Lab., TN (USA)). May 1988. Contract AC05-84OR21400. 116p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88010763/JAW.

The Environmental Regulatory Update Table provides information on regulatory initiatives of interest to DOE operations and contractor staff with environmental management responsibilities. The table is updated each month with information from the Federal Register and other sources, including direct contact with regulatory agencies. Each table entry provides a chronological record of the rulemaking process for that initiative with an abstract and a projection of further action. This report contains a monthly update of environmental regulatory activity that is of interest to the Department of Energy. It is provided to DOE operations and contractor staff to assist and support environmental management programs by tracking regulatory developments. Any proposed regulation that raises significant issues for any DOE operation should be reported to the Office of Environmental Guidance and Compliance.

36488 (PB—88-182597/XAB) Gene engineering of yeasts for the degradation of hazardous waste. Environmental research brief, July 1983-June 1986. Loper, L.C. (Cincinnati Univ., OH (USA). Coll. of Medicine). Jan 1988. 6p. NTIS, PC A02/MF A01.

This research examined the structure and function of cytochrome P-450 genes in yeast as a model for gene engineering such as eukaryotic P-450 enzymes for biodegradation of hazardous waste by yeasts. Saccharomyces cerevisiae and Candida tropicalis are two yeasts known to produce major P-450 enzymes. These enzymes were purified, and antibodies produced in rabbits were then used in the isolation or characterization of clones containing a P-450 gene from each organism. DNA sequence was determined for the gene isolated from S. cerevisiae and for several hundred bases of chromosomal DNA on each side of the gene, and deletion experiments in the promoter region were conducted. The deduced protein sequence from this gene was compared to those of the other known subfamilies of eukaryotic P-450 genes; the several features identified included a new homology region for these protein sequences. The C. tropicalis gene and its promoter region have been partially sequenced.

36489 (SNV—3148) Combating acidifying emissions. Swedish strategies and policies. Loevgren, K. (National Swedish Environmental Protection Board, Solna). 1986. 30p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752944/JAW.

Sulphur emissions in Sweden have decreased by more than two-thirds as from the peak value of the early 1970s. The emissions of nitrogen oxides increased heavily during the 1950s and the 1960s. Since 1980 they have decreased. The aim of the Swedish government is to reduce sulphur dioxide emissions by not less than 65% and nitrogen oxides emissions by 30% between the years 1980 and 1995. Swedish emissions of hydrocarbons are projected to decrease by about 30% between 1980 and 1995. Emissions must be reduced, not only in Sweden but all over Europe, if damage from acidification and air pollution is to be avoided.

36490 (WHC-SA—0068-FP) Hanford Fire Department hazardous material response program. Good, D.E. (Westinghouse Hanford Co., Richland, WA (USA)). Aug 1987. Contract AC06-87RL10930. 13p. (CONF-8708246—1). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009192/JAW.

From Fire protection conference; Chicago, IL, USA (25 Aug 1987).

A large number of hazardous materials are used daily in chemical processing and other operations at Hanford. These materials are transported by truck and rail and stored at various site locations. In addition a main public highway, State Route 240, runs through the Hanford Site and is used for transporting agricultural chemicals to farms and orchards in the surrounding area. An extensive plan for responding to emergencies involving radiological materials has been developed and implemented at the site. The more probable accident, that involving the spill or release of a toxic material, has recently emerged on the national scene as an area that also requires emergency preparedness planning. The Hanford Fire Department, over the past two years, has developed and implemented a Hazardous Materials Response Program (Haz-Mat) to address the increased toxic materials concern. The Fire Department Haz-Mat team and its response are an integrated part of a comprehensive Hanford Site Nonradiological Hazardous Materials Emergency Plan. 2 tabs.

36491 Environmental protection for the 1990s and beyond. Russel, M. (Oak Ridge National Lab., TN (USA)). *Environment;* **29**: No. 7, 12-15, 34-38(Sep 1987).

Four major changes taking place in environmental protection are: (1) a focus on toxic substances and their ecological impacts, (2) a shift from industrial to private citizen responsibility, (3)

new tools and strategies among the environmental professionals, and (4) shifting roles played by various levels of government and private citizens. Following a historical review which highlights the ecological and health effects of strip mining, the author explores environmental threats and protection in terms of how humans relate to natural systems. The wide dispersal of pollution sources will require changing the behavior of individuals and trading some personal freedoms in order to reduce risks. The new approach will require a more open decision making process so that citizens and institutions become partners in the effort.

36492 **Chemical emergencies: evaluation of guidelines for risk identification, assessment, and management.** Morris, S.C.; Moskowitz, P.D.; Fthenakis, V.M.; Hamilton, L.D. (Brookhaven National Lab., Upton, NY (USA)). *Environment International;* 13: No. 4-5, 305-310(1987).

In the wake of tragic accidents in Italy, India, Mexico City, and elsewhere, the Council of European Communities, the International Labor Organization, the US Environmental Protection Agency, and the World Bank have each issued guidelines for identifying, assessing, and managing risks from major hazards at industrial facilities. These guidelines are examined and compared. All treat the general problem in similar ways. Presence of a specific compound exceeding that thought to present a potential hazard to public health triggers further action. But, there are different threshold quantities among these guidelines due to different interpretations about such factors as toxicity and dispersive potential. A problem common to all guidelines is their failure to deal quantitatively with probabilities of accidents. Development of additional screening methods is recommended. 21 references, 6 tables.

36493 **(NEI-FI—37) Finland and energy.** (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). 1986. 14p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752920/JAW.

Energy activities and development in Finland are shortly reviewed. Finland's energy consumption per capita is one of the highest in the world. The reasons for this are the heating needs and the structure of industry. All fossil fuels must be imported. Domestic energy, such as hydropower, peat and firewood in its various forms cover only about 30% of total consumption. Energy was a significant factor in the Finnish economy even before the world-wide energy crisies in early 1970's. Development of energy - efficient technology has long had a high priority in Finland. Finland is one of the leading countries using nuclear power, in 1985 38% of electricity was produced in the four nuclear power plants. For the future, the total energy consumption is expected to grow more slowly than average for the past decades. The growth is predicted to be about on half of the growth of the gross national product. That's why it is obvious that the objectives of energy conservation and more efficient use of energy, started in the Energy Policy Programme, can be achieved.

36494 **(NP—8752804) Report for the period 1. July 1986 - 30. June 1987 from the Mineral Resources Administration in Greenland.** (Raastofforvaltningen for Groenland, Copenhagen (Denmark)). Sep 1987. 80p. (In Danish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752804/JAW.

The Mineral Resources Administration considered licensing and application for exploration and exploitation concessions from several companies like A/S Arco Greenland, Nunaoil A/S, Arktisk Mine Kompagni A/S etc. The petroleum exploration in Jameson Land and the concession for Jameson Land were renegotiated. Greenex A/S and their mining project in Marmorilik were discussed like the continuation of the mine. The Kanumas project on exploration of petroleum in Western and Eastern Greenland contains seismic surveys and implies the cooperation with international oil companies. The economy and the environmental aspects of the different exploration project is likewise discussed. (SM).

36495 **(PB—88-863584/XAB) Polyethelene terephthalate (PET) scrap recycling. January 1973-May 1988 (Citations from the Rubber and Plastics Research Association data base). Report for January 1973-May 1988.** (National Technical Information Service, Springfield, VA (USA)). May 1988. 100p. NTIS PC N01/MF N01.

Supersedes PB—87-860854.

This bibliography contains citations concerning the recycling of polyethelene terephthalate products. Discarded bottles and household PET scrap are primary sources of this material. Recycling machinery, processes, and programs are discussed. Cable insulation, sheet films, foam products, and other products made from recycled polyethelene terephthalate are described. The impact recycling this material has on resource conservation and waste-disposal problems is evaluated. (This updated bibliography contains 209 citations, 34 of which are new entries to the previous edition.)

36496 **(SDJBA—1986) James Bay Development Corporation annual report, 1986.** (Society for the Development of James Bay and Affiliates (Canada)). 1986. 56p. (In French). (MICROLOG—88-01427). Societe de developpement de la Baie James (Quebec), 110, boulevard Matagami, C.P. 970, Matagami, P.Q., Canada J0Y 2A0; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The James Bay Development Corporation is a paragovernmental body whose objective is to promote the development and exploitation of those natural resources, other than hydroelectric, which are found in the James Bay region of Quebec. It also oversees the administration and infrastructure management in the territory. This report reviews the year's activities of the Corporation and its affiliates involved in tourism, native development, mining, and municipal affairs. Most of the report consists of financial statements.

36497 **(ANL—8010091) Argonne National Laboratory technology transfer report, FY 1987.** (Argonne National Lab., IL (USA)). Nov 1987. Contract W-31109-ENG-38. 33p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010091/JAW.

In 1985 Argonne established the Technology Transfer Center (TTC). As of the end of FY 1987, the TTC has a staff equivalent to four full-time professionals, two secretaries, and two student aides; FY 1987 ORTA funding was $220K. A network of technology transfer representatives provides windows into and out of Argonne's technical divisions on technology transfer matters. The TTC works very closely with the ARCH Develoment Corporation, a not-for-profit corporation set up to commercialize selected Argonne and University of Chicago patents. The goal of the Technology Transfer Center at Argonne is to transfer technology developed at Argonne to the domestic private sector by whatever means is most effective. The strategies by which this is accomplished are numerous and the TTC is, in effect, conducting a number of experiments to determine the most effective strategies. These include cooperative R&D agreements, work-for-others contracts, subcontracting to industry, formation of joint ventures via ARCH, residencies by industry staff at Argonne and vice versa, patent licensing and, of course, conferences, workshops and visits by industry and to industry.

36498 **(CONF-880528—6) The technical editing internship: What makes it work?.** Caruthers, C.M.; Caruthers, L.E.; Schmidt, B.J. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 6p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88010041/JAW.

From 35. annual international technical communication conference; Philadelphia, PA, USA (10 May 1988).

The following paper presents the experiences and perceptions of the three main participants of a technical editing internship

at Argonne National Laboratory during the summer of 1986. Linda Caruthers, Clifford Caruthers, and Bryan Schmidt{emdash}teacher, supervisor, and intern, respectively{emdash}share what they received as their roles and responsibilities in guiding, managing, and becoming an entry-level technical editor. The following discussions demonstrate how the efforts of three people pursuing different objectives achieve the primary goal of all technical writers and editors: high-quality publications.

36499 (DOE/DP—8008612) Technology security: Volume 1. (USDOE Assistant Secretary for Defense Programs, Washington, DC. Office of International Security Affairs). Mar 1988. 121p. NTIS, PC A06/MF A01; GPO Dep. Order Number DE88008612/JAW.

This study defines the scope of DOE nuclear and nuclear-related technology transfer and security interests and explains their interrelationship, describes existing programs and activities which support these interests and assesses their impact on one another, and identifies pertinent factors that should be taken into consideration in devising measures that may enhance these programs. The focus is on those DOE nuclear and nuclear-related technologies which could make significant contributions to military programs in other countries. The study examines several mechanisms which are viewed as important avenues for technology transfer, (i.e., visits assignments, and foreign travel; public releases; international activities; and clandestine acquisition). The input of various DOE program offices and laboratories was elicited. This provided the benefits of each organization's expertise in technology controls. Moreover, the responsibilities and programs of other US government agencies involved in technology controls were examined in conjunction with DOE's area of responsibilities.

36500 (NEI-FI—36) Energy research and development program. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). Sep 1984. 24p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752877/JAW.

The national economy of Finland is very energy-intensive. Finland has no high-grade fossil fuel resources, the indigenous energy sources being limited to wood, hydropower and peat. Fossil and nuclear fuels have to be imported over long distances. Energy was a key cost factor in the Finnish economy even before the oil crisis. Development of energy-efficient technology has long had a high priority in Finland. After the sharp increases in energy prices which occurred in the 1970s, the Government of Finland decided to promote energy conservation and the use of indigenous fuels. One of the key measures here was to increase government funds for energy R and D. The real value of R and D government funds doubled between 1979 and 1981. The basic guidelines for government financed R and D are set forth in the National Energy Policy Programs approved in 1979 and 1983. Based on the latter, the Ministry of Trade and Industry prepared and published its own Energy R and D Program in 1983. This program, which includes several background reports, in published in Finnish only. The present publication is an English summary of the Program, along with a few case projects and other related information.

36501 (NEI-NO—34, pp 38) **Gas technological development perspectives.** Berg, J.O. (Institutt for energiteknikk, Kjeller (Norway)). 1987. (In Norwegian). NTIS (US Sales Only), PC A10. Order Number DE88752839/JAW. (CONF-8704287—).

From Seminar on gas in Nordic energy supply; Oslo, Norway (8 Apr 1987).

The purpose of the paper is to elucidate problems and possibilities of importance for Norway's position as a gas producer and exporter. IEA's perspective analysis towards the year 2010 shows that the total consumption of gas in Europe and USA may increase by 40% and 15%, respectively. In the electric power production there is a considerable technological potential for further development of the gas turbine, and this may contribute to maintain the share of gas in the electricity production. The same may be the case in the development of fuel cells, in a somewhat longer perspective. For Norway, special technological challenges are attached to the utilization of those gas resources that cannot be transproted in pipes to the great markets of Europe in a profitable way. This gas must be utilized by conversion to electricity or liquid products, and the gas has been transported ashore in pipes, or in direct connection to the production system. In both cases it will be of vital importance to find the total system solutions which will give the best economic result. 21 refs., 9 figs.

36502 (ORAU—88/B-55) Office of Energy Research collaborative research programs administered by Oak Ridge Associated Universities: Annual report, FY 1987. (Oak Ridge Associated Universities, Inc., TN (USA)). Feb 1988. Contract AC05-76OR00033. 60p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88009040/JAW.

The US Department of Energy's (DOE) Office of Energy Research (OER) sponsors programs designed to encourage and support interaction between US colleges and universities and DOE research facilities. Faculty members, graduate students, undergraduates, and recent postgraduates participate in research and receive advanced training at DOE laboratories. Staff members from DOE laboratories visit campuses to deliver energy-related lectures and participate in seminars and classroom discussions. Oak Ridge Associated Universities (ORAU) has been involved in the developemnt and administration of these collaborative research programs since their inception. During FY 1987, ORAU administered appointments for the Office of Energy Research under the following two umbrella programs: University/DOE Laboratory Cooperative Program (Lab Co-op); Science and Engineering Research Semester (SERS). In addition, ORAU participated in a project to collect and assess information from individuals who had held research appointment as undergraduate students during a four-year period from 1979 to 1982. All of these activities are summarized in this report.

36503 The role of the DOE over the next decade: A view from Washington. Stewart, F.M. Jr. (Office of State and Local Assistance Programs, US Dept. of Energy (USA)). pp 228-237 of Proceedings of the governor's conference on energy investments. Profiting from energy savings. Honolulu, HI; Dept. of Planning and Economic Development (1985). (CONF-8505319—).

From Governor's conference on energy investments: profiting from energy savings; Honolulu, HI, USA (8 May 1985).

The author discusses where the Department of Energy (DOE) stands now and where it is headed. He explains some of the new ways the DOE is getting communities involved with energy conservation. He supports three-part financing but urges companies to be concerned with who has control of the project. He says every situation in terms of energy efficiency is unique and needs to be looked at with a different perspective.

This report deals with juridical actions carried on by the Dutch anti-nuclear power action committee against the nuclear power plant in Dodewaard, KEMA, the Ultra-Centrifuge and dumping of radioactive materials. 17 refs.

36506 (IIUG/dp—87-8) Technological protest in West Germany. Signs of a politicization of production. Conrad, J. (Wissenschaftszentrum Berlin fuer Sozialforschung gGmbH (WZB) (Germany, F.R.). Internationales Inst. fuer Umwelt und Gesellschaft). 1987. 36p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753547/JAW.

This study deals with the question whether increasing social conflicts around technology in general as well as specific technological projects can be reasonably interpreted as evidence for a substantive politicization of production in advanced capitalist democracies with historically new social problems and cleavages. Therefore, the socio-economic conditions and determinants of technological protest, the typical features of technological controversies, and the characteristics of the German protest development are described. The available rsearch results provide some indications for the above hypotheis but do not allow any stringent conclusions yet for reasons which relate conclusively to the pattern of protest development hitherto observable, and to still existing deficits of social science research. (orig./HKP).

36507 (ND-R—1466(R)) Case for the UK nuclear power industry and the implications of its closure. Locke, D.H.; Caley, J.R. (UKAEA Northern Research Labs., Risley). Apr 1987. 13p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753610/JAW.

The Chernobyl accident has produced calls for a moratorium on further nuclear power development and construction in the UK or, in the extreme, a phasing out of existing nuclear power stations. Some suggestions as to how to counteract these demands have been collected using published information wherever possible.

36508 (STEV—1987-4) After Chernobyl. Possibilities of phasing out nuclear power in Sweden. (Statens Energiverk, Stockholm (Sweden)). 1987. 94p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752501/JAW.

According to the currently applicable Parliamentary decision, the phasing out of nuclear power in Sweden must be completed by the year 2010. The National Energy Administration has analyzed the following questions. If it were to become evident that operating several or all of the Swedish nuclear power plants entailed serious risks, what possibilities would there be of phasing them out in the short term or over a longer period. And what would the consequences be with regard to the national economy and the environment? First we report the consequences of a rapid phase-out. Here, it is assumed that several or all nuclear plants would be taken out of operation within a period of two years. Available compensatory resources would be limited to more intensive utilization of existing hydropower, back-pressure plants, combined power and heating plants and oil-fired plants. The second alternative is a phase-out in ten years. Moreover, a case is discussed in which phase-out is planned and implemented from 1987 to 2005. Such a plan would provide industry more time to adjust, while a number of alternative techniques and fuels could be used to replace nuclear power. The consequences of the different phase-out alternatives can be described only within a framework of certain assumptions regarding the worldwide development. Important factors here include fuel prices and economic trends. Environmental restrictions comprise another important prerequisite.

36509 (AD-A—190147/9/XAB) Nuclear power plants. (Air Force Systems Command, Wright-Patterson AFB, OH (USA). Foreign Technology Div.). 18 Dec 1987. Trans. of mono. Zhong Guo He Xuehui (China) Sep 1986 2, 4-9, 12-13, by Randy Dorsey. (FTD-ID(RS)T—1374-87). 16p. NTIS, PC A03/MF A01.

China's energy resources are unequally divided. Most of the coal reserves are in the north and most of the water-power resources are in the western part of the country. It is imperative that nuclear power be developed in the energy-poor region of the east, the south and the northeast where industry and population is rather concentrated. Should the north's coal be transported to the south; the amount to transport is immense and this is economically unfeasible. Contents include: Nuclear Power Plants and Capacities for Various Countries and Regions of the World (As of the end of 1985); China Needs to Develop Nuclear Power; China has Already Established a Rather Comprehensive Nuclear Fuel Cycle Complex; China has the Capability to Develop Nuclear Power; Qinshan Nuclear Power Plant Under Construction; Guangdon-Daya Bay Nuclear Power Plant to be Build Under Joint Venture.

2908 Waste Heat Utilization

36510 (BFR-R—81-1986) Hoestvetet project in Stockholm. The suncourt system: a glazed courtyard heat pumps and a borehole heat store for an apartment building. Kellner, J. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 184p. (In Swedish). NTIS (US Sales Only), PC A09/MF A01. Order Number DE88752890/JAW.

This report describes a systems incorporating seasonal heat storage in a borehole heat store in rock, built beneath a newly designed and erected apartment building containing 71 flats. The building features a glazed courtyard, from which surplus heat during the summer is used as the heat source for two heat pumps. When heat input from the courtyard is insufficent, energy is abstracted from the outside air. The suncourt project forms part of the 'Stockholm project', and will be put forward by the Swedish Council for Building Research as the Swedish contribution to the IEA/IECD energy research programme, which accounts for its English name. The 'Stockholm project' as a whole includes a furher five experimental building projects. Besides a description of the Suncourt project itself, the report also desribes the feasibility of other applications of seasonal heat storage in rock, togheter with a general description of the fire precautions and acoustic aspects applicable to glazed courtyards. (authors).

36511 (BFR-R—89-1986) Heat storage in clay for a group heating plant in Gothenburg. Part I. Overall design for an existing property. Part II. System and cost investigations. Buresten, R.; Hofgren, K.H.; Kasza, A. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 72p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752894/JAW.

Part 1 of this report describes the detailed design of a heat store constructed in clay with heat pump and wind convectors for a group heating plant owned by AB Goeteborgshem in Gothenburg. The system is intended to provide 78 percent energy coverage for 186 apartments and to operate both as seasonal heat store and as a direct outdoor air heat pump. A complete set of enquiry documentation, consisting of 20 or so drawings, has been prepared, describing in detail how the system should be designed. The work has been based on comprehensive preparatory work, including geological and geotehnical consequence analysis, allowing the system to be rated with the assistance of a computer. Architectonic and acoustic considerations were also included in the design in order to ensure that the system would melt into its environment. Tenders were subsequently invited from about ten contractors, and the replies have been used as a basis for the comparative cost calculations presented in Part 2. This includes, for example, comparison of solar collectors with wind convectors as collectors for a heat storage system. Storage technology is also compared with other possible alternatives, in this case that of a straight outdoor air heat pump with wind convectors. The conclusion is that an outdoor air heat pump alone provides the lowest total heat production cost, and that solar collectors result in higher total costs than a heat store with wind convectors. However, more fundamental economic consideration, as seen by the supplier of electrical energy, indicates that storage technology would be preferable. This is because the poorer coefficient of performance of the outdoor air heat pump results in additional costs necessitated be reinforcement of the supply system and electrical energy production in coal-fired and oil-fired condensing power plant. (authors).

36512 (BFR-R—95-1986) Cold water heat distribution system for Ekeby Soedertaelje. A feasibility study. Bodinson, L.; Malmqvist, B. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 41p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752899/JAW.

The objective of this work has been to investigate the technical and economic feasibility of supplying heat to an existing residential area of detached houses, using a cold heat distribution system. The thermal load density of such areas is so low that conventional district heating is seldom economic for such applications, due primarily to the high costs of the distribution system. On the other hand, a cold heat distribution system can be built for considerably less, as a result of the lower media temperature requiring less demand on materials and insulation. The report also compares a number of individual system designs. The results of the investigation show that:- The introduction of a public heat supply system in existing areas of detached housing requires a high take-up. However, the high costs make this difficult to achieve, although good long-term economics can be demonstrated. - The distance to the heat source (Lake Maelaren in the case considered here) is too great. - Cold heat distribution using surface earth layers as its heat source is the most economic public system.- If cold heat supply systems are built, established institutions such as local authority energy companies should be responsible for them. - The cheapest system today, in relation to the assumptions in the investigation, is the electric boiler. (authors).

36513 **(BFR-R—96-1986) Cold water district heating for Djuraas town centre, Gagnef. A fesibility study.** Norbaeck, K. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 40p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752900/JAW.

The objective of this project have been to investigate the technical and economic feasibility of abstracting heat from a groundwater source and using it to meet part of the energy requirements of a residential area. Two alternative proposals were investigated: 1. Supplying only three larger buildings with groundwater heat. 2. Supplying all buildings with groundwater heat. It is the intention to pump groundwater from a nearby sand/gravel ridge to the various subscribers. Heat pumps in each building would abstract heat, after which the cooled groundwater would be returned. The expected flow in the distrubution would amount to about 83 m/sb3/ per hour for Alternative 1 or about 255 m/sb3/ per hour for Alternative 2. The heat supply systems in the buildings would be complemented by heat pumps to provide a total output of about 450 kW (Alternative 1) or 1250 kW (Alternative 2). The proportion of heating energy supplied by the heat pumps would amount to about 83.5 percent or 87 percent respectively. Additional heat would be supplied from existing heat production plant. The investment cost for Alternative 1 is calculated as amounting to about SEK 3.3 milion, while that for Alternative 2 would amount to about SEK 7.95 milion. The operating cost saving for Alternative 1 would be about SEK 330,00 per year, while that for Alternative 2 would be about SEK 698,00 per year. This would give payoff times for the two alternatives of about 9.8 and 11.4 years respectively. Calculated using the present value method, both alternatives would provide positive present values during their technical/economic lives of 15 years, amounting to about SEK 833,00 and SEK 600,000 respectively.

36514 **(NYSERDA—88-2) Potential impacts of climate change on electric utilities: Final report.** (ICF, Inc., Washington, DC (USA)). Dec 1987. 128p. New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223. Order Number TI88010322/JAW.

This report summarizes the analytic approach and preliminary findings of a study jointly sponsored by the Edison Electric Institute, the Electric Power Research Institute, the New York State Energy Research and Development Authority, and the US Environmental Protection Agency. In addition to these organizations, an advisory board of global climate scientists and utility executives provided comment and direction during the design phase of the study. The project examines the potential impacts of greenhouse-gas-induced climate change on the demand for electricity and electric utility planning and operations in two case studies. The study focuses on the next 30 years, a period of direct relevance to utility planning, but a period of modest temperature changes compared with predictions for the latter part of the 21st Century. 23 figs., 35 tabs.

36515 **Energy demand in developing countries: A sectoral analysis of recent trends.** Sathaye, J.; Ghirardi, A.; Schipper, L. (International Energy Studies, Applied Science Div., Lawrence Berkeley Lab., Berkeley, CA 94720 (US)). pp 253-282 of Annual review of energy: Volume 12. Hollander, J.M. Palo Alto, CA; Annual Reviews Inc. (1987).

The International Energy Studies (IES) group at Lawrence Berkeley Laboratory has been one of the pioneering centers for sectoral- and end-use-oriented study of national energy consumption. In recent years, the group has developed a sectoral data base for more than 20 less developed countries (LDC). This data base is built from national, rather than international, information sources, including national statistical agencies, public and private energy-supply businesses, and local academics. In analyzing energy demand, the authors examine four sectors in each country: industry, transportation, residential/commercial, and electricity generation. They establish measures of energy intensity (energy consumption per some appropriate unit) for each sector, and seek to understand the changes in the structure of that sector that influence its energy intensity. The analysis also examines the changing fuel mix in each sector and the reasons for any change. This article presents information on sectoral energy demand and structural changes in the 1978-1984 period for 18 LDCs in Asia, Latin America, and West Africa. (Data on selected countries in the Middle East are being incorporated in the study.) It also discusses the outlook for energy demand during the next decade. Together, the 18 countries account for more than 70% of LDC energy and oil demand. Within each region, the study countries account for 75% or more of total energy demand. They include major oil-exporters and oil-importers, and vary widely in per capita income and economic growth rates.

This document contains comments by individuals experienced in the application of epidemiology to legal proceedings. The authors define the legal process as it applies to damage claims, they provide examples of significant decisions, and they explain the rules for the use of epidemiological data as evidence. 17 refs.

36517 **(DOE/OR/00033—T238) Report on identification of federal radiation issues: To the Federal Coordinating Council for Science, Engineering and Technology.** (Committee on Interagency Radiation Research and Policy Coordination, Washington, DC (USA)). Mar 1986. Contract AC05-76OR00033. 12p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE87012861/JAW.

The Committee on Interagency Radiation Research and Policy Coordination (CIRRPC) was established on April 9, 1984 by the Office of Science and Technology Policy (OSTP) under the authority of the Federal Coordinating Council for Science, Engineering and Technology (FCCSET). It is chaired by OSTP. CIRRPC membership consists of those agencies having specific responsibilities or interest in radiation research and/or policy. CIRRPC has two elements: The Committee itself, consisting of subcabinet and senior policy level representatives, and a Science Panel, consisting

of senior radiation scientists from the respective member agencies. The structure and membership of CIRRPC is shown in Figure 2. It was decided at the inception of CIRRPC to identify the radiation issues of concern to the Federal agencies, Congress, and professional societies faced with radiation policy or scientific issues. It was felt that a current list of national radiation issues should be assembled so that CIRRPC could concentrate on these issues and the dividends from CIRRPC's resources could be maximized at the earliest possible time. These issues are listed.

36518 **(NRRI—87-18) Administrative procedures for proactive regulation.** Burns, R.E. (National Regulatory Research Inst., Columbus, OH (USA)). Mar 1988. 140p. National Regulatory Research Institute, 1080 Carmack Road, Columbus, OH 43210. Order Number TI88008628/JAW.

This study treats two types of alternative procedures that might be used by state public utility commissions in place of trial-type, adjudicatory administrative procedures. These are procedures that can lead to more efficient determination of routine forward-looking economic, financial, and other regulatory policy issues. Since the inception of administrative law, state public utility commissions have used trial-type, adjudicatory procedures for setting rates. However, the commissions have recently been faced with complex, prospective policy issues that cannot be easily considered using adjudication. Also, many of these issues have a large number of potential solutions and any one solution will affect many of the interested parties. Indeed, the use of adjudicatory procedures when a state public utility commission deals with complex prospective policy issues may well be counterproductive. These trial-type procedures can lead to a less accurate policy decision because the procedure is inappropriate. In particular, use of a trial-type procedure creates the potential for the decision-maker to get incomplete information on an issue. Trial-type procedures remain appropriate for the routine rate case, where most of the main determinations to be made are factual.

36519 **(RISO-M—2677) Project evaluation for energy supply in rural areas of developing countries.** Christensen, J.M.; Vidal, R.V. (Risoe National Lab., Roskilde (Denmark)). May 1987. 31p. (CONF-8708249—1). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752932/JAW.

From 11. triennial conference on operations research; Buenos Aires, Brazil (10 Aug 1987).

This paper reports the methodological experiences of the project: "Energy Supply Technologies in Developing Countries"; carried out in collaboration with the Department of Energy, Zambia. Existing methods for project evaluation, based on cost-benefit analysis, will be briefly presented, particularly as regards their inadequacy for assessing energy projects in rural areas. An alternative practical and PC-based approach will be presented in which emphasis is placed on the problem formulation phase, including the socio-economic, cultural and political aspects of the problem. This approach has been prepared for training purposes. Finally, some methodological thoughts based on our practical experiences will be presented and our future work will be briefly discussed. 21 refs.

36520 **(EMR—25051981) Canada Oil Substitution Program.** (Department of Energy, Mines and Resources, Ottawa, Ontario (Canada)). May 1981. vp. (CE—01501). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

As part of the National Energy Program, the Canadian government introduced the Canada Oil Substitution Program in 1981 to decrease dependence on oil supplies for home heating. The program provides financial incentives to householders to assist changing their heating systems from oil-fueled systems to those using more abundant alternate fuels, notably gas and electricity. Under this program, those whose homes are heated by oil are eligible for a taxable grant covering half the costs of approved conversions, up to a specified maximum. This press kit includes general information on criteria for eligibility and allowable expenses in determining such grants. Since the eligible fuel alternatives vary from province to province, separate brochures are included to provide information to applicants from the various parts of Canada.

36521 **(EMR/CRE—011981) New liquid fuels.** (Department of Energy, Mines and Resources, Ottawa, Ontario (Canada). Conservation and Renewable Energy Branch). Jan 1981. 35p. (CE—01440). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

Research and development (R & D) is identified in Canada's National Energy Program as a significant element of the strategy for achieving energy objectives. As one element of strategy, R & D must be planned in concert with other government policies or incentives. It must foster Canadian industry and expertise, assist in addressing regional imbalances in resource distribution, and help establish the options needed to secure an energy future. For this role to be realized, R & D priorities and planning must be guided by policy. To achieve this guidance, a planning must be guided by policy. To achieve this guidance, a planning process is proposed for liquid fuels R & D that will effectively combine policy concerns with the judgement and capabilities of the committees for key research programs. Five key research programs in new liquid fuels are identified: direct liquefaction, gasification, biological processes, fuels processing, and fuel use. Each area is itself broken down into program elements. For each element a minimum and a recommended level of resources (1981-1984) is given. Criteria are proposed that can be used to determine priorities for allocating funds between minimum and recommended levels. A number of research proposals received are also listed. By and large, these proposals are poorly defined, and lack the detail necessary for their effectiveness relative to the task in hand to be assessed. There are also significant gaps in the research covered by current proposals. In most cases, decisions to support particular proposals would be premature at this time; this emphasizes the need for an expeditious R & D planning process. 1 fig., 4 tabs.

From Seminar on gas in Nordic energy supply; Oslo, Norway (8 Apr 1987).

This paper reviews the past development of the natural gas industry in West Germany and analyzes the prospects of gas on the West German energy market, while salient features which may be relevant for natural gas in Scandinavia are discussed in the second part of the paper. In the Federal Republic of Germany a medium-sized highly industrialized nation with a high population density, natural gas is sold on an energy market of a size not surpassed in any other West European country. In fact, conditions in West Germany have a certain model character, as natural gas is offered on a relatively liberal energy market. If subsidies to the West German hard coal industry are disregarded, energy supply and demand are controlled by the forces of the market. As domestic oil reserves are very small, West Geremany is highly dependent upon imported energy. Natural gas, which covers some 15% of primary energy demand, is also largely imported, mainly from West European sources. On the other hand, any comparison between the West German gas industry and the gas industries in the Nordic countries will be of limited validity, because the market for gas in West Germany has advanced to a certain maturity. If the experience made during the development of the gas industry in West Germany is to be helpful for the development of gas in the Nordic countries, the market price principle is the concept that should be transferred. It is essential, though, that project decisions are not exclusively taken in the light of the price conditions at the time of the decision, but must account for likely developments during the life of the project. 11 figs.

36523 (SOQUIP—1987) SOQUIP [Societe Quebecoise d'Initiatives Petrolieres] annual report, 1986/1987. (SOQUIP, Quebec (Canada)). 1987. 32p. (In French). (MICROLOG—88-01463). SOQUIP (Societe quebecoise d'initiatives petrolieres), 1175, rue de Lavigerie, Case Postale 10650, Ste-Foy, P.Q., Canada G1V 4P5; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

SOQUIP is a corporation wholly owned by the Quebec government whose activities include oil and gas exploration and production, energy supply, natural gas distribution, and energy research and development. This report reviews the year's activity of SOQUIP and its subsidiaries (including SOQUIP Alberta, SOQUIP Atlantique and Noverco). Financial statements and production/consumption statistics are included.

36524 (AD-A—190620/5/XAB) Optimization of some parameters of atomic steam-gas powerplant. Ratnikov, Y.F. (Air Force Systems Command, Wright-Patterson AFB, OH (USA). Foreign Technology Div.). 21 Oct 1985. 18p. (FTD-ID(RS)T—1582-84). NTIS, PC A03/MF A01.

Unedited machine trans. of Izvestiya Vysshikh Uchebnykh Zavedeniy, Energetika (USSR) No. 6, 49-54(Jun 1972).

Determination of optimum parameters of binary-type atomic steam-gas powerplant is a difficult analytical problem in view of the complicated interdependence of parameters, which characterize the reactor, gas-turbine, and steam-turbine parts of the installation. Conclusions include: 1) Determination of optimum parameters of atomic steam-gas installation is recommended to produce with gas consumption = const and heat output of the reactor = var. since best technical-economic indices of installation correspond to this case. 2) With increase in power of atomic steam-gas installation, together with improvement in economic indices, the optimum pressure ratio descends and optimum temperature of feed water increases. 3) Increase in the fuel component leads to a decrease of optimum pressure ratio and to increase in temperature of feed water. 4) Change of cost of reactor plant over wide limits virtually does not have effect on numerical values of optimum parameters being investigated. 5) In all cases optimum pressure ratio is more, and temperature of feed water is less than outer limits, obtained by thermodynamic calculations.

36525 (DOE/EIA—0226(88/03)) Electric power monthly. (USDOE Energy Information Administration, Washington, DC). Mar 1988. 46p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011940/JAW.

Total net generation by electric utilities in the United States for the month of March 1988 was 213,838 gigawatt-hours, 6% higher than the amount reported a year ago. Net generation using coal, gas, and nuclear power was higher (7, 8, and 18%, respectively) as compared to March 1987. Petroleum and water were the only two energy sources with lower levels of net generation than was reported in March 1987. Petroleum-fired generation was off 2% and hydroelectric generation was down 3 percent as compared to a year ago.

36526 (DOE/EIA—0397(87/4Q)) Electric power quarterly, October-December 1987. (USDOE Energy Information Administration, Washington, DC. Office of Coal, Nuclear, Electric and Alternate Fuels). 19 Apr 1988. 349p. NTIS, PC A15/MF A01 - GPO;1; GPO Dep. Order Number DE88009294/JAW.

The EPQ presents monthly summaries of electric utility statistics at the national, divisional, state, company, and plant levels on the following subjects: quantity of fuel, cost of fuel, quality of fuel, net generation, fuel consumption, and fuel stocks. In addition, the EPQ presents a quarterly summary of reported major disturbances and unusual occurrences. These data are collected on the Form IE-417R. Every electric utility engaged in the generation, transmission, or distribution of electric energy must file a report with DOE if it experiences a major power system emergency.

36527 (EPRI-EM—5806-Vol.2) Secondary data for demand-side management planning and implementation: Volume 2, Case studies: Final report. Limaye, D.R.; Burkey, M.B.; Davis, T.D. (Electric Power Research Inst., Palo Alto, CA (USA); Synergic Resources Corp., Bala-Cynwyd, PA (USA)). May 1988. 147p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011364/JAW.

Information on market characteristics is needed for effective planning and implementation of demand-side management (DSM) programs. A wide range of information can be obtained quickly and inexpensively from existing data sources. This report identifies the sources of secondary data, including federal, state and local government agencies, utilities, EPRI and various private organizations. The specific types of data available from these organizations and their applicability and usefulness in demand-side management, are reviewed. A PC-based software package, DATA-DSM, has been developed to assist the user in easily and quickly identifying the relevant secondary data sources. The Guidebook is organized in two volumes. The first volume provides a comprehensive listing of the data sources and software packages to assist market implementation planning, and provides a description and user guide for the DATA-DSM software package. The second volume provides the results for three illustrative utility case studies, and presents an illustrative example of the use of geographic mapping software to display secondary data. 48 figs., 22 tabs.

36528 (IIUG/dp—86-15) Small-scale power and electric utility regulation: Potential for reform. Bongaerts, J.C.; Kraemer, R.A. (Wissenschaftszentrum Berlin fuer Sozialforschung gGmbH (WZB) (Germany, F.R.). Internationales Inst. fuer Umwelt und Gesellschaft). 1986. 49p. Wissenschaftszentrum Berlin fuer Sozialforschung g.G.m.b.H. (WZB) (Germany, F.R.). Internationales Inst. fuer Umwelt und Gesellschaft.

Current electric utility regulations invariably favour large-scale power production which necessitates long-distance transmission and prohibits the use of waste heat originating in the power plants. At the same time small-scale electricity generating technologies are available which have much higher total energy conversion rates, or do not burn fossile fuels. The relevant regulations of the Netherlands, the Federal Republic of Germany, and the United Kingdom, as analysed in the paper, restrict effective competition from these small-scale power producers and thereby protect existing electricity generating plants. A closer look at the economies of scale in this industry reveals that it might not constitute the optimal configuration and that customers might benefit from re-regulation. A certain capacity and generation potential for one small-scale generation technology (combined heat and power or co-generation) is found for different classes of customers which could be realised by regulatory reform. (orig./HSCH).

36529 (NEI-NO—34) Seminar on gas in Nordic energy supply. (Norsk Energiforening, Oslo). 1987. 222p. (In Norwegian). (CONF-8704287—). NTIS (US Sales Only), PC A10. Order Number DE88752839/JAW.

From Seminar on gas in Nordic energy supply; Oslo, Norway (8 Apr 1987).

The conference proceedings contain 11 papers. The topics covered are: Norwegian gas in Nordic energy supply; Thermal power in Swedish energy supply; Thermal power in Danish energy supply; Thermal power in Finnish energy supply; Perspectives on the application of Norwegian gas in the Nordic countries; The platform for natural gas in West Germany; Domestic use of gas; Gas technological development perspectives; Gas in the power production; Natural gas in Sweden - the experiences so far; Gas power - a challenge to the Norwegian industry. Separate abstracts were prepared for 7 papers of the proceedings.

36530 (NEI-NO—34, pp 18) **Norwegian gas in a Nordic energy context.** Oeyen, A. (Olje- og energidepartementet, Oslo). 1987. (In Norwegian). NTIS (US Sales Only), PC A10. Order Number DE88752839/JAW. (CONF-8704287—).

From Seminar on gas in Nordic energy supply; Oslo, Norway (8 Apr 1987).

Norway's export of natural gas is a little more than 25 billion m3 per year, and that is about 11% of the gas consumption in Western Europe. It is expected that the Norwegian gas production will be relatively stable the next two years. The export is assumed to reach a peak of ca 28 billion m3 in 1989. Recently great interest has been shown in Norway for gas in the Norwegian energy supply, both for electric qower production and direct application. An agreement has been reached between Statoil and Statkraft for sale of gas to a planned power plant on the west coast of Norway, based on natural gas from the North Sea. The agreement implies deliveries up to an amount of l billion m3 gas per year for 25 years from 199l. Of special interest for the Norwegian gas export is the Swedish market, which seems to have a considerable growth potential. Due to its geographical position, Haltenbanken appears as the perhaps most interesting region for energy export to Sweden. The export may be in the form of electricity (power plant in Norway) or as gas transported in a pipe. 4 figs.

36531 (NEI-NO—34, pp 23) **Thermal power in Swedish energy supply.** Sundell, J. (Statens Vattenfallsverk (Sweden)). 1987. (In Swedish). NTIS (US Sales Only), PC A10. Order Number DE88752839/JAW. (CONF-8704287—).

From Seminar on gas in Nordic energy supply; Oslo, Norway (8 Apr 1987).

The future of the natural gas in Sweden is strongly coupled to the electric power supply and the phasing out of nuclear power by the year 2010. In a short term perspective the Swedish natural gas market is estimated to 2.5 billion m3. It is reasonable that only a certain part of the nuclear electric power production will be replaced by an electric power production based on natural gas. With this assumption the Swedish natural gas market in the beginning of the next century will be of the order of 5-7 billion m3 per year. Potential suppliers of natural gas are Norway, the Soviet Union via Finland, and Denmark. 2 figs., 4 tables.

36532 (NEI-NO—34, pp 27) **Thermal power in Danish energy supply.** Guldborg, S. (Dansk Naturgas A/S, Denmark). 1987. (In Danish). NTIS (US Sales Only), PC A10. Order Number DE88752839/JAW. (CONF-8704287—).

From Seminar on gas in Nordic energy supply; Oslo, Norway (8 Apr 1987).

Based on a resolution in the Parliament in 1979, a high pressure natural gas system has been established in Denmark. In cooperation with the regional natural gas companies the gas has now been conveyed to practically all parts of the country. According to investigations in the North Sea, there are about 100 billion m3 proven reserves of natural gas, and a total amount of reserves of 240 billion m3. 20 figs.

36533 (NEI-NO—34, pp 12) **Perspectives on the application of Norwegian gas in the Nordic countries.** Ager-Hanssen, H. (Statoil, Stavanger (Norway)). 1987. (In Norwegian). NTIS (US Sales Only), PC A10. Order Number DE88752839/JAW. (CONF-8704287—).

From Seminar on gas in Nordic energy supply; Oslo, Norway (8 Apr 1987).

An outline is given of the development of the gas activity in Norway. In 1986 the total Norwegian production of natural gas was about 25 billion m3. A conservative estimate of the amount of Norwegian gas applied in the Nordic countries in the year 2000 is 10 billion m3, with 3 billion in Sweden, 2.5 billion in Denmark, 2 billion in Finland and 2.5 billion m3 in Norway. A more extensive estimate, which assumes that some of the nuclear power plants in Sweden have been phased out, results in the following figures for the year 2000: 9 billion m3 in Sweden, 3.5 billion in Denmark, 3 billion in Finland and 3.5 billion in Norway. 2 figs.

36534 (NEI-NO—34, pp 10) **Thermal power in Finnish energy supply.** Rantanen, J. (Neste Oy (Finland)). 1987. (In Swedish). NTIS (US Sales Only), PC A10. Order Number DE88752839/JAW. (CONF-8704287—).

From Seminar on gas in Nordic energy supply; Oslo, Norway (8 Apr 1987).

Among the Nordic countries, Finland is the one that has applied natural gas for the longest time. In 1974 Russian natural gas was introduced in the southeastern part of the country. According to an agreement with the Soviet Union, Finland is obliged to import 1.4 billion m3 natural gas per year until 1993. The natural gas is competitive as energy source both in industry and for heating in buildings. The greatest growth in application will be outside the industry, especially in the district heating. The consumption of natural gas is expected to increase to about 3 billion m3 per year towards the end of the 1990's.

36535 **(PB—88-179262/XAB) Demonstration of new submetering technologies. Final report.** Hirschfeld, H.E.; Stone, S.M. (Hirschfeld and Stone, Glen Cove, NY (USA)). Oct 1986. 133p. NTIS, PC A07/MF A01.

The project was designed to investigate submetering technologies and to assess their conservation impact, based on energy efficiency and economics. Four types of submetering systems were installed in separate multifamily residential housing complexes in New York City. Three of the systems are categorized as new submetering technologies and the fourth uses conventional electromechanical metering. The new types of systems are: (1) Electronic metering using carrier wave technology for communications; (2) Electronic metering using dedicated wiring for communication; and (3) Hybrid metering, combining an electromechanical-type communications system. The new systems were evaluated for performance and reliability and all of the systems were evaluated for economics.

36536 **(STU—80-4813) Capacity expansion planning for hydro-thermal electric power systems.** Nordlund, P. (Swedish National Board for Technical Development, Stockholm). Feb 1986. 149p. NTIS (US Sales Only), PC A07. Order Number TI88752971/JAW.

This report contains an overview of available expansion planning tools for electric power systems, and a proposition of a method that can be included in existing planning aids to improve the hydro power representation. The general formulation of the power system expansion planning problem is presented in section 2. Analysis and solution methods presented in section 3 include Production Costing, Linear and Dynamic programming, Benders' Decomposition and Decision Analysis. Two widely spread program packages, WASP (Wien Automatic System Planning package) and EGEAS (Electric Generation Expansion Analysis System) are presented in sections 4 and 5. In sections 6 and 7 some specific hydro related analysis methods are discussed, concerning production costing and storage modeling. An overall methodology suggestion for hydro modeling improvement in existing planning packages is presented in section 8. Finally, a simple application example is presented in section 9. With 35 refs.

2980 Consumption And Utilization

REFER ALSO TO CITATION(S) 35680, 36477

36537 **Energy consumption and structure of the US residential sector: Changes between 1970 and 1985.** Meyers, S. (Energy Analysis Program, Lawrence Berkeley Lab., Berkeley, CA 94720 (US)). pp 81-98 of Annual review of energy: Volume 12. Hollander, J.M. Palo Alto, CA; Annual Reviews Inc. (1987).

Between 1970 and 1985 the number of homes in the United States increased by 35%, and the average home became more appliance-intensive. Yet primary energy demand of the residential sector was only 17% higher than in 1970, and "useful" energy demand (i.e. excluding transformation losses in power plants and home furnaces) was only 5% higher. On a per capita basis, primary energy demand, which grew by 57% between 1960 and 1973, was 8% less in 1985 than in the peak year of 1973. Useful energy demand per

capita was 16% less. Demand per household declined even more, as the average household became smaller and thus had gradually less demand for energy services. The increase in the demand for services, which arose from more households, each with more appliances, was balanced by a decrease in the energy demand associated with each service. This decrease in energy intensity has been shaped by responses to higher energy costs and by technological change. The changes in residential energy demand are outgrowths of structural changes in the physical setting (geographic distribution of the population, household characteristics, and the state of buildings and their energy-using equipment), along with behavioral changes (people's amount of time at home and their behavior in the home). The structural features and behavior are in turn shaped by the economic setting, the institutional setting (i.e. the orientation of governments, energy suppliers, and equipment manufacturers), demographic changes, and the social psychological setting that influences household energy-related decisions and behavior. This article reviews the changes since 1970 in US residential energy consumption and in the structure of the household sector. The main sources for data at the national level are statistics gathered by various federal agencies, especially the Energy Information Administration of the US Department of Energy.

2990 Unconventional Sources And Power Generation

36538 (BFR-R—85-1986) Cold district heating using groundwater in Timraa. A feasibility study. Gedda, C.; Jonsson, R. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 23p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752892/JAW.

The objective of this work has been to investigate the feasibility of supplying heat to buildings by means of a cold water distribution system, from which heat would be abstracted at the point of use by heat pumps. The cold water could be abstracted from the old underground esker aquifer of the Indal river, a groundwater flow system that is unique in Sweden. However, the feasibility study indicates that the costs would be too high in the light of present-day energy prices and the size of the potential load. The system might, however, become feasible if there was new development in the area, allowing cold water to be distributed for individual heating of buildings. A necessary requirement for use of this method is that the distribution system should be compact, or that the heat load density within the area should be high, i e that of an urban area.(authors).

36539 (BFR-R—91-1986) River water as a heat source. Jelbring, H. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 28p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752896/JAW.

The heat pump installation in Kaunisjoensuu customs post has been in operation now for two seasons. During this time, virtually all the heating power and energy has been supplied by the heat pump. The pump has abstracted heat from the Muonio river, which is covered with ice for six months of the year, through a hose heat exchanger. During the winter, about 60 percent of the necessary energy has been obtained by heat exchange of sensible heat, and 40 percent as the latent heat of freezing, with ice gradually building up round the heat exchanger so that, by the end of the heating season, the total volume of ice amounts to about 200 m/sb2/. The Kaunisjoensuu heat pump installation demonstrates the practical and general feasibility of using water as a heat source, irrespective of its temperature. The specific design load rating of a hose heat exchanger for laying in a river should lie between 6 - 15 W/m. The report describes the advantages and disadvantages of the particular design of heat exchanger used here. A number of technical novelties intended to achieve a good coefficient of performance have been successfully tested. The amount of purchased energy per heated square meter and year has amounted to 88 kWh for the 1982/83 heating season. Translated to the corresponding needs of an installation on the latitude of Stockholm, this would be equivalent to 57 kWh per m/sb2/ and year. The heat pump installation in Kaunisjoensuu therefore constitutes a good example of what can be achieved with a properly designed system. Nevertheless, it would be possible to improve on the system, and both The Swedish Council for Building Research and the author hope that this report can contribute to an improved insight into the feasibility and limitations of the method, particularly with respect to the potential of Swedish rivers as energy resources.

36540 (KTM/E-D—136) Use, production and competitiveness of wood chips as a fuel - According to the Finnish forest development programme "Forest 2000". Vitikka, A. (Kauppa- ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). 1987. 66p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752824/JAW.

This report describes the use, production and competitiveness of wood chips as a fuel. The harvesting potential of wood chips as a fuel is also presented regarding the Finnish forest development programme "Forest 2000". As a district heating fuel wood chips were used about 750 GWh and in industrial power plants about 400 GWh in 1985. The small-scale use of wood chips - mainly in farms - was also about 400 GWh in 1985. Of the total technical capacity to utilize wood chips 30% was used in district heating and 10% in industrial power plants in 1985. The main commercial suppliers of wood chips in Finland are Vapo Oy and Osuuskunta Metsaeliitto. At the moment the most economical way of supplying wood chips is to make whole tree chips. Wood chips made that way can be transported to a site at a price of FIM 50-60/MWh under favourable harvesting conditions. At a current price of crude oil wood chips cannot compete with heavy fuel oil in district heating and with sod peat wood chips can compete only if subsidized. As a fuel industrial power plants the competitiveness of wood chips is also relatively week and has further weakened during 1986. The use of wood chips as a fuel can increase notably only if the prices of imported fuels rise.

36541 (NEI-DK—77) Utilization of wind energy resources in Naqu, Tibet. (Energistyrelsen, Copenhagen (Denmark)). Jan 1986. 176p. NTIS (US Sales Only), PC A09. Order Number DE88753332/JAW.

The first part of this report contains descriptions of the background for a study performed by a Danish delegation of energy experts, concerning the possibilities to utilize wind energy resources in the Prefecture of Naqu in Tibet, China. The Danish delegation was invited to make a fact finding mission in September 1985 to Tibet in order to obtain information about wind conditions, the existing energy supply system and demand patterns and the actual plans for economic and social development in Naqu Prefecture. Descriptions are given of the Windmill Test Station in Naqu, the Meteorological Station in Naqu and wind data at this last station. Information of a primarily selected site for windmills (Digema Hill) and other possible sites follows. Many energy developments in Naqu are possible, and some elements in such developments are described, with special attention to wind power plant, potential electricity consumption in the industrial and the domestic sector and the public electrical network. The third part includes finally some further considerations on future possible improvements of the energy supply system in Naqu: A tentative programme for establishing a 450 kW wind power capacity, development of a distribution system for heat (hot water) in Naqu and a sketch of an alternative concept for a wind energy village. Conclusions are formulated as four sets of recommendations directed to the Energy Leading Group in Tibet. Wind energy is only a part of the potential energy supply options. Thus decisions on wind energy should be seen as a part of strategy for the development of the total energy sector. Consisting of energy demand, supply systems are energy resources. (EG).

30 DIRECT ENERGY CONVERSION

3001 Mhd Generators

REFER ALSO TO CITATION(S) 38321

36542 (AD-A—190307/9/XAB) Fundamental studies on MPD thrusters. Final progress report, April 1985-December 1986. Lawless, J.L. (Carnegie-Mellon Univ., Pittsburgh, PA (USA). Dept. of Mechanical Engineering). 2 Sep 1987. 258p. (—1-52097). NTIS, PC A12/MF A01.

A theory was developed that predicts onset and erosion in MPD thrusters. The theory predicts onset currents that are in quantitative agreement with experiment. Erosion rates are predicted for a steady-state hot-cathode thruster. This theory is the first to model the viscous and thermal-electrode boundary layers in MPD thrusters. Stability criteria for diffuse-mode electrode current conduction were found.

36543 (AD-A—190309/5/XAB) Physical fluid mechanics in MPD thrusters. Annual report, 1 May 1986-30 April 1987. Martinez-Sanchez, M. (Massachusetts Inst. of Tech., Cambridge (USA). Space Systems Lab.). 18 Sep 1987. 53p. NTIS, PC A04/MF A01.

This report describes work done on three areas of MPD research: (a) a rigorous theoretical examination of the one-dimensional flow of a self-field accelerated plasma, clarifying the roles of area change, sonic vs. magnetoacoustic shocking, and finite magnetic Reynolds number. (b) continued development of computational codes for axisymmetric MPD flows, and (c) results of a first test series on two channels designed to verify productions on the effects of area variation, showing ability to redistribute current by this means.

36544 (CONF-880647—1) Materials tests in support of MHD steam bottoming plant. Natesan, K.; Swift, W.M. (Argonne National Lab., IL (USA)). May 1988. Contract W-31-109-ENG-38. 12p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012040/JAW.

From 26. symposium on engineering aspects of magnetohydrodynamics; Nashville, TN, USA (20 Jun 1988).

Test data have been developed for the corrosion of several commercial ASME-coded alloys and their weldments by exposing internally cooled ring specimens to simulated MHD environments. The specimens, coated with a K_2SO_4-rich deposit, were exposed for times up to 2000 h at metal temperatures of 762 and 593°C to simulate intermediate-temperature air heater (ITAH) and transition region conditions, respectively. The gas temperatures in these tests were 982 and 816°C, respectively. This paper discusses, in detail, the observed corrosion scale morphologies of various exposed specimens. Data on scale thickness, depth of intergranular penetration, and metal recession are presented and the results are used to assess the corrosion behavior of various materials for application in the MHD steam bottoming plant.

36545 (LTKK-EN—D-12) Regulation properties of a system MHD generator - electric power network. Krzysztof D. (Lappeenrannan Teknillinen Korkeakoulu (Finland). Energiatekniikan Laitos). 1987. 36p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752830/JAW.

In this report several problems connected with the mutural operation of MHD generator and electric power network are described, i.e. regulation properties of the MHD-generator, optimal matching of the MHD-generator and converters, current regulation in transient states. The results for transient states caused by mass flow rate and stagnation temperature drop at the MHD-generator duct inlet are also presented.

3004 Thermionic Converters

36546 Thermionic characteristics of planar and cylindrical oxygen additive tungsten-niobium diodes. Hatch, G.L.; Korringa, M.; Sahines, T.P. (Rasor Associates, Inc., Sunnyvale, CA (US)). pp 2007-2010 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—).

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879125.

As a part of the ongoing Thermionic Technology Program, a test matrix of both cylindrical and variable spacing planar thermionic diodes has been designed to establish a generic data base over the range of emitter and collector temperatures, electrode spacings, and electrode materials of significance for thermionic fuel element (TFE) application. The converters were fabricated at Thermo Electron and performance mapped at Rasor Associates. Emitter surfaces tested are both CVD tungsten WF_6(100) and WCL_6(110) crystal orientations, while the collector surfaces are plain niobium or sublimed molybdenum oxide coating on niobium substrate. The results from the test matrix can be used to establish the optimum collector oxide layer and emitter surface crystal orientation for a variety of applications besides the TFE program since oxide collector layers and emitter surface crystal orientation can significantly improve converter performance at large spacings and high current densities. The electrical properties of diodes with the same electrode surface combinations in both planar and cylindrical geometries are measured to establish the applicability of data from variable spacing planar diodes to the engineering design of optimized cylindrical TFE cells and prediction of their efficiency. The wide parametric range of diode performance measurements includes data, not available prior to this work, useful for an understanding of plasma and plasma-electrode processes in thermionic convertors.

3005 Fuel Cells

36547 (CONF-880665—4) Monolithic fuel cells. McPheeters, C.C.; Balachandran, U.; Dees, D.W.; Dorris, S.E.; Heiberger, J.J.; Mrazek, F.C.; Myles, K.M.; Picciolo, J.J.; Poeppel, R.B. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012004/JAW.

From 33. international power source symposium; Cherry Hill, NJ, USA (13 Jun 1988).

Recent work on the MSOFC (Monolithic Solid Oxide Fuel Cell) has resulted in the following accomplishments: (1) the feasibility of the MSOFC concept has been proven, (2) the fabrication processes have advanced to the point of production of near defect-free fuel cell stacks, (3) the electrode characteristics have been significantly improved to enhance MSOFC performance, (4) single-cell performance has been demonstrated at very high current densities, and (5) multi-cell stack performance has improved significantly in terms of both higher open-circuit potential and lower cell resistance. The objectives of further development are to scale up the MSOFC in terms of power level, active area, and stack height. Scale-up to significant power levels (above 1 kw) will involve development in several areas including manifolding, insulation, gas handling and control, electrical contacts, and power control.

36548 (DOE/FE—0105) Fuel cell systems program plan: FY 1988. (USDOE Assistant Secretary for Fossil Energy, Washington, DC. Office of the Deputy Assistant Secretary for Oil, Gas, Shale and Special Technologies). May 1988. 43p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011080/JAW.

The DOE fuel cell program supports high-risk, high-payoff technology development. This provides industry with the capability to develop and apply fuel cell systems that use conventional and alternative hydrocarbon fuels. The principal DOE fuel cell program goal is to develop cost effective, efficient, and environmentally benign fuel cell systems which will operate on coal-based fuels (and dual fuels: coal and gas) in multiple end use sectors. In the near-term, and as an interim step in achieving this goal, distillate

fuel and natural fuel cell system technologies will also be developed. This interim step is a logical progression to the more complex coal-fueled systems and provides a marketable gas-fueled technology. The specific near- to mid-term (mid-1990s) objectives are to develop the key fuel cell technology for phosphoric acid, molten carbonate, and solid oxide fuel cell systems, and to evaluate and conduct research on more advanced fuel cell concepts that would further improve technical and economic performance. Advanced fuel cell concepts may in the long-term (post 2000) offer potential for use in additional applications such as in the transportation and residential sectors. In these applications oil could be displaced by fuel cell systems using fuels derived from coal.

36549 **(DOE/FE/60338—2557) Phosphoric acid electric utility fuel cell technology development: Technical progress report No. 33, for quarter ending October 31, 1987.** (International Fuel Cells Corp., South Windsor, CT (USA)). 1987. Contract AC21-83FE60338. 10p. (FCR—9206). NTIS, PC A03;3. Order Number DE88010187/JAW.

The Department of Energy has initiated this program to advance phosphoric acid electric utility cell stack technology and to reduce cell stack cost. The cell stack has a nominal 10-ft² active area and operates at 120 psia405{degree}F. The program comprises six parallel phases, which culminate in a full-height, 10-ft² stack verification test. The only active technical task under this program is Phase VI, Task 5—Operational Testing. The objective of this task is to conduct additional testing of the full-height 10-ft² stack with a goal of reaching 3500 hours.

36550 **(LBL—24340) Oxygen reduction in fuel cell electrolytes.** Striebel, K.A.; McLarnon, F.R.; Cairns, E.J. (Lawrence Berkeley Lab., CA (USA)). Dec 1987. Contract AC03-76SF00098. 244p. NTIS, PC A11/MF A01;1; GPO Dep. Order Number DE88008240/JAW.

Experimental and theoretical studies of oxygen reduction (OR) in novel acid and alkaline electrolytes on smooth and supported Pt have been carried out. Similar kinetically limited rates for OR were measured in the {open←quotes}super-acid{close←quotes} electrolytes trifluoromethane sulfonic acid (TFMSA) and tetrafluoroethane-1,2-disulfonic acid (TFEDSA), with the rotating disk electrode (RDE) technique at 23{degree}C and pH = 1. A first-order dependence on O_2 pressure was measured. The mechanism for OR on Pt in alkaline electrolytes is complicated by the concurrent oxidation and reduction of Pt. Rotating ring-disk electrode (RRDE) studies carried out with anodic and cathodic potential sweeps in 0.1 to 6.9 M KOH and 0.1 to 4.0 M K_2CO_3 revealed similar currents when corrected for O_2 solubility differences. In dilute electrolytes, OR proceeds primarily through the 4-electron pathway to water, independent of pH. In KOH, the mechanism for Pt oxidation changes and the fraction of current yielding a peroxide product increases at 2 to 3 M. These changes were not observed in K_2CO_3. Porous gas diffusion electrodes (GDE) with supported Pt catalyst were studied in a special cell with low uncompensated solution resistance. Cyclic voltammograms yielded measurements of the wetted areas of carbon and Pt and the local electrolyte composition. GDE galvanostatic steady-state performance with 100% O_2 was measured in 2 to 11 M KOH and 2 to 5.5 M K_2CO_3. Results suggest that OR on carbon contributes to the high currents in 6.9 M KOH at high overpotentials. In K_2CO_3, lower wetted areas and slow OH/sup {minus/} ion transport are responsible for the poor performance when compared with KOH. Models for the steady-state operation of porous GDE's were developed. These models account for the diffusion and reaction of O_2 and ionic transport in KOH and K_2CO_3. 120 refs., 71 figs., 11 tabs.

36551 **(PB—88-203161/XAB) Production and characterization of non-platinum catalytic materials formed by ion implantation. Annual report, November 1, 1986-October 31, 1987.** Greenwald, A.C. (Spire Corp., Bedford, MA (USA)). Dec 1987. 23p. (AR—20342-01). NTIS, PC A03/MF A01.

Catalytic activity for oxygen-ion production in a phosphoric acid fuel cell was observed with electrodes prepared with nitrogen ion-implanted carbon blacks. These electrodes were prepared without the addition of any metals, and especially without platinum. Comparisons to electrodes prepared with platinum and metal-ion implants is presented. Methods of preparation and measurement are discussed.

36552 **Internal electrolyte supply system for reliable transport throughout fuel cell stacks.** Wright, M.K.; Downs, R.E.; King, R.B. (to Dept. of Energy, Washington, DC). US Patent 4,732,822. 22 Mar 1988. Filed date 10 Dec 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

In a fuel cell stack having electrolyte feed and drain means and stacked fuel cells, each fuel cell including bipolar plates separating the fuel cell from adjacent fuel cells in the stack thereof and an electrolyte-containing matrix disposed between the plates, and improved internal electrolyte supply system interconnecting the feed and drain means is described comprising: (a) first means defined repeatedly throughout the fuel cell stack for flowing electrolyte along a series of first paths each extending directly through at least one cell between the plates thereof so as to expose electrolyte to the matrix of the cell; and (b) second means defined repeatedly throughout the fuel cell stack for flowing electrolyte along a series of second paths extending through the plates of the cell stack and by-passing respective ones of the first paths so as to supply electrolyte directly to respective others of the first paths without first going through the ones of the first paths.

3008 Miscellaneous Converters

36553 **(DOE/CE/15218—T1) Hydrogen concentration cells as converters of heat into electricity: Final report [for the period ending September 30, 1987].** Salomon, R.E. (Temple Univ., Philadelphia, PA (USA). Dept. of Chemistry). Oct 1987. Contract FG01-85CE15218. 50p. NTIS, PC A03 . Order Number DE88009662/JAW.

The properties of the platinum coated Nafion hydrogen pressure cell have been determined over a range of conditions and as a function of the variable parameters associated with the preparation of this cell. Other protonically conducting membrane cells have been prepared with both commercially available membranes and membranes synthesized in our laboratory but we have been unable to find any membrane, which works better in the application described here, than Nafion. Two different Nafion membranes have been utilized in this work (125 and 117) and the differences between them were negligible. Accordingly, the bulk of this report will deal with the platinum coated Nafion hydrogen pressure cell. As part of our efforts to enhance cell conductance, solution composition was varied as was time of contact with the platinizing solution. The efficacy of multiple coatings was also analyzed. Other metals were tried as electrocatalysts as were other methods of reduction (hydrazine and molecular hydrogen) in place of our main reducing agent, sodium borohydride. Various cell configurations were designed, built and tested and as a result of this we have determined that high pressure contacts are most desirable. We have determined the pressure and temperature dependence of these cells and in the course of this have found a super-Nernstian cell behavior which has both practical and theoretical significance for this invention. Two concentration cell systems have been assembled and tested for some periods of time and the results suggest that the two concentration cell converter may be most useful when the low temperature is subambient and the high temperature heat source is at ambient.

32 ENERGY CONSERVATION, CONSUMPTION, AND UTILIZATION

REFER ALSO TO CITATION(S) 36464

36554 **(DOE/CE—0200) Annual report to the President and the Congress on the State Energy Conservation Program for calendar year 1986.** (USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC. Office of Energy Management and Extension). Oct 1987. 13p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88006896/JAW.

This volume briefly reviews state participation in the State Energy Conservation Program during 1986. Appropriations and grants are listed. (JDH)

36555 (TKK-KO/LVI—B15) Effect of HVAC-systems on the energy management. Roos, R. (Helsinki Univ. of Technology, Otaniemi (Finland)). 1987. 105p. NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752863/JAW.

This study is concentrated on four states in the U.S. (Iowa, Michigan, Minnesota and Wisconsin) and Finland. The study consists of five main chapters. These are: factors effecting on the HVAC-technical decisions; typical HVAC systems in the U.S.; flexibility, technical properties and energy efficiency of typical conventional HVAC systems in the U.S.; new HVAC systems and equipment and electricity consumption peak levelling. Most important factors effecting on the HVAC-technical decisions are: climate, primary energy sources, construction industry, community structure, and various standards and codes. Climate in Finland and in the studied states is not similar. The "continental" climate in the U.S. has caused some typical featres in the HVAC systems used. Some of these are: In the hot summer season cooling is needed, Usually this is provided by cold air, and In the cold season warm air is used for space heating.

3201 Buildings

36556 (BFR-R—39-1986) Heat pumps using air as their heat source. Defrosting methods. Fehrm, M. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 8 Dec 1985. 46p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752881/JAW.

The objective of this work has been to describe the various methods used for defrosting air heat pickup coils for heat pumps, and to describe the methods used for starting and stopping defrosting. The report describes a number of different principles and methods of starting, carrying out and stopping defrosting. Most of this information has been drawn from literature such as research reports and technical articles. Defrosting can be initiated by comparing the temperature or pressure to drop on the air or refrigerant sides. Other methods involving electrical or optical detection also exist. In some cases, defrosting is initiated purely under time control. Similar methods can be used to stop defrosting. Frost is generally removed by supplying heat either via the refrigerant, through the cooling agent, by air, by electric heaters among the heat pickup coils or by radiant heat, with mechanical scraping being used in one case. The report describes various methods of defrosting, and of inhibiting the formation of frost or improving the efficacy of defrosting. It has not been possible to include a qualitative comparison between the various methods, as the source material was too sparse to permit such comparison. With 19 refs.

36557 (BFR-R—66-1986) Hall-buildings with dynamic insulation. Present state of development. Thoren, T. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 31p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752885/JAW.

Today, the new insulation technique, dynamic insulation, has been adapted in a simplified type of roof (produced without the special air pressure layer that the author has found necessary for good performance) in hundreds of hall buildings in Sweden. (With hall-buildings means different non-residential buildings, such as shopping centers, factories, offices etc). Outside Sweden, mainly in Finland, about one million squ. meters of hallbuildings have been built since 1975 with principally the same type of simplified counterflow roofs. In some cases, these roofs have shown deficiencies, which, however, can be eliminated by new technical solutions. The theoretical base for the technique is to-day documented in inter alia different reports by the Swedish Council for Building Research. The gap between theory and advanced serial production has, however, not been systematically worked up. The intention of this report is to fill this gap to some extent. The report also gives some alternatives for the future development towards a commercial serial production. The author, who also is the inventor of this technique, has worked out different practical solutions for these alternatives.

36558 (BFR-R—72-1986) Rock heat installation with 80 KW heating power capacity. Performance monitoring of a rock heat installation consisting of seven boreholes and heat transfer medium in a closed circuit. Tollin, J.; Aabyhammar, T. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 45p. (In Swedish). NTIS (US Sales Only), PC A03. Order Number DE88752888/JAW.

A rock heat installation with a nominal output of 80 kW was constructed during the spring of 1983 to supply heat to a property having a normal oil consumption of 70 m/sp3/ per year. The property, which consists of two apartment buildings, is in Taeby. The rock heat collector consists of seven 150 mm diameter boreholes, drilled to a depth of 150 m. The report describes the prerequisites and experience relating to design, rating and installation of the rock heat collector. It describes both the design of the boreholes and of the heat transfer medium system. Apart from certain interruptions, system performance measurements have been made over a continuous period of three years. The results from the measurements are included in the report. Summarizing, it can be said that the installation has provided the expected saving in oil consumption of 55 m/sp3/ per year, in spite of considerable control problems. The calculated borehole temperatures agree with the as-measured temperatures.

36559 (BFR-R—94-1986) Experimental day nursery. Selection of systems and materials. Hult, M. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 109p. (In Swedish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752898/JAW.

The aim of this project was to build a day nursery whose structure building materials, heating system, ventilation, controling and regulating equipment and lighting would combine to produce a good indoor climate. The present report describes the specification of requirements underlying the design of the experimental day nursery, as regards the thermal and hygienic climate. This specification elucidates and discusses experience of climatic problems and day nursery production in the City of Stockholm. Guidelines are laid down concerning the following aspects of day nursery design: floor temperature, room temperature, air humidity, air pollutants, supply air quality, air flow, ventilation efficiency and operational dependability/maintenance. The report ends with a description of the design of the day nursery, the materials selected for it and the built-in experimental facilities for heating and ventilation. The day nursery is being erected on a site in Molntappen precinct (at Skarpnaecksfaeltet, southeast of Stockholm). It is due for completion in December 1986, after which it will be evaluated over a threeyear period. 31 refs.

36560 (BFR-R—98-1986) Climatic prerequisites for air curtain portals. Taesler, R. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 59p. (In Swedish). NTIS (US Sales Only), PC A04. Order Number DE88752901/JAW.

This report deals first with the basic conditions of importance for effective performance and low energy losses of air curtain portals. It then describes examples of specially developed statistics illustrating the effects of variations of wind direction, wind velocity and ambient temperature. Calculations of average nominal energy loss through an open doorway without an aircurtain have been made on the basis of observations over the period from 1955 to 1975 for various places throughout the country. This is followed by description and results of measurements of local and building-related effects on wind and temperature conditions for a particular installation in Linkoeping. Wind conditions in particular exhibit considerable changes due to the local environment directly resulting from the surrounding building structure. The work has been carried out by the Swedish Meteorological and Hydrological Institute, together with AB Bahco Ventilation and the Department of Heating and Ventilating at the Royal Institute of Technology in Stockholm, as a part of larger project for investigating energy conservation resulting from the use of air curtain portals.

36561 **(BFR-R—113-1986) Energy conservation town block at Uppsala.** Bjerkling, S.E. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 122p. (In Swedish). NTIS (US Sales Only), PC A06. Order Number DE88752907/JAW.

On selected housing estates at six locations in Sweden: Malmoe, Goeteborg, Sundbyberg, Uppsala, Umeaa and Kiruna, energy conservation measures were planned and implemented with the object of finding the savings effect and cost effectiveness of each of these measures. This project sets out the results obtained on the housing estate Rangstroem 2 at Uppsala. The report is introduced by general information concerning the buildings, preliminary investigations and planned measures. This is followed by energy calculation models, observations concerning the energy conservation measures, measurement results and evaluations. The report is concluded by instructions for running these residential buildings which had been drawn up and put into practice. In the two stages concerned, the following results were obtained with regard to energy savings and the cost of the measures, in relation to the reference building. Stage 1, Weather proofing of external walls and windows. Alteration of ventilation installation 25 percent SEK 84.3 per m/sp2/ net floor area. Stage 2, Conversion of ventilation in underfloor space from fresh air to indoor air ventilation, 30 percent SEK 32.9 per m/sp2/ net floor area. Balancing of heating system. Conversion of windows (1 building) 40 percent SEK 66.8 per m/sp2/ net floor area. The report also contains information concerning the experiences obtained in relation to the remedial measures, the attitude of the tenants to the remedial works, the way the instructions for running the buildings have worked, etc.

36562 **(BSRIA-TN—5/87) Ice storage for UK air conditioning systems.** Stewart, L.J. (Building Services Research and Information Association, Bracknell (UK)). Sep 1987. 16p. Building Services Research and Information Association, Old Bracknell Lane West, Bracknell, Berks. RG12 4AH, price Pound 15.00.

The technical developments and trends in the application of ice storage techniques are reviewed based on published information, primarily from the USA, and the case for the application of ice storage on the UK air conditioning scene is considered. There is case study information now available that indicates that ice storage systems can lower the overall costs of central station air conditioning systems by using lower operating temperatures when cooling. Not only does storage reduce the chiller system capacity requirement but the lower temperatures available can reduce the size of the air and water distribution systems. If lower capital costs can be confirmed for ice storage systems then this will be the stimulus to the adoption of these systems in the UK.

36563 **(CONF-871203—3) A comparison of two independent techniques for the determination of in-situ thermal performance.** Courville, G.E.; Desjarlais, A.O.; Tye, R.P.; McIntyre, C.R. (Oak Ridge National Lab., TN (USA); Dynatech Scientific, Inc., Cambridge, MA (USA); Koppers Co., Inc., Monroeville, PA (USA)). 1987. Contract AC05-84OR21400. 30p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009704/JAW.

From Conference on insulation materials, testing and applications; Bal Harbour, FL, USA (6 Dec 1987).

A parallel experiment has been performed on an insulated roof system installed in the Roof Thermal Research Apparatus (RTRA) at Oak Ridge National Laboratory (ORNL). Separate sections of a 4 foot, by 8 foot test panel were evaluated for over 12 months using two different heat flux transducer (HFT) instrumentation packages with the data being treated independently. The paper discusses the instrumentation packages, sensor calibration procedures, and data collection and analysis methods highlighting the differences between the independent techniques. A comparison of the independently derived thermal performance results is presented. The comparison includes a discussion of these types of HFT test techniques for determining the in-situ thermal performance of insulated building components. Limitations of these procedures are also detailed.

36564 **(CONF-880702—13) Magnetic heat pumps.** Hull, J.R.; Uherka, K.L. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 28p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012058/JAW.

From 23. intersociety energy conversion engineering conference; Denver, CO, USA (31 Jul 1988).

Magnetic heat pumps and refrigerators are potential replacements for vapor-compression devices that use chlorofluorocarbon refrigerants. Several room-temperature designs, using low-temperature superconducting magnets, have reached the experimental device stage. High-temperature superconducting materials may significantly increase the viability of the technology, both by enhancing existing design concepts and by enabling new major design types such as field switching of the superconducting magnets.

36565 **(CONF-8804120—1) Impact of color on the thermal performance of roofs.** Shipp, P.H.; Griggs, E.I. (Oak Ridge National Lab., TN (USA); Tennessee Technological Univ., Cookeville (USA). Dept. of Mechanical Engineering). 1988. 23p. (CONF-8804120—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009713/JAW.

From American Chemical Society's Rubber Division meeting; Dallas, TX, USA (20 Apr 1988).

The number of roofing products available to architects and building owners has expanded greatly in the past decade. Roofs can now be specified in a variety of colors with the selection being based upon both the aesthetic effect and the potential energy savings which can accrue from different surface reflectance properties. The use of light versus dark colors can significantly affect the range of temperatures to which the membrane is subjected. This can impact both the energy performance of the building and the aging characteristics of the membrane, adhesives and other roof system components. Factors affecting the thermal performance of light and dark colored roofs are discussed and a procedure for predicting the temperature response of the roof membrane in various climates is presented.

36566 **(CRIE-U—86055) Heating and cooling performance of air-to-air heat pumps installed in the greenhouses with vegetables growth.** Kozakai, Kazuyoshi; Uehara, Tsuyoshi; Okano, Toshiaki. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). May 1987. 29p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752534/JAW.

Two units of integral-type air-air heat pumps (rated capacity: 7.5 KW each) and a heat storage type air-air heat pump (rated capacity: 7.5 KW) equipped with a heat storage water tank were installed in the experimental greenhouses (315 m^3 and 126 m^3) to introduced the heat pump as part of the development of power demand for the greenhouse culture. The experiment of hydroponic culture of tomatos in both summer and winter and merons in summer was made controlling the temperature and humidity in the greenhouse. The coefficient of performance (COP) of the integral-type air-air heat pump was 2.2 to 2.3 in the cooling season and 2.3 to 2.6 in the heating season. The crop of tomato per 10 areas was 11.6 tons in summer and 14.2 tons in winter and both crops were more than the mean valve in the greenhouse culture. The COP of the heat storage type air-air heat pump was 2.2 in the cooling season and 2.6 in the heating season. The average weight of a melon was 1.7 kg and the sugar content was approximately 13%. The crop and quality of melon exceeded the levels in the greenhouse culture. (14 figs, 8 tabs, 7 refs)

36567 **(DOE/CE/15324—T4) Component: dimmers, commercial: [Final technical progress report, February 1, 1988-April 30, 1988].** (Underwriters Labs., Inc., Research Triangle Park, NC (USA); Varigas Research, Inc., Timonium, MD (USA); Etalon Corp., Timonium, MD (USA)). 20 Apr 1988. Contract FG01-87CE15324. 23p. Underwriters Laboratories Inc., 12 Laboratory Dr., P.O. Box 13995, Research Triangle Park, NC 27709. Order Number TI88008781/JAW.

This paper contains a detail description and safety testing a two-wire v-controller by underwriters laboratories. (DLC)

36568 **(DOE/CE/63424—T1) Low income energy programs at mid-decade: limits and opportunities: Final report.** (Economic Opportunity Research Inst., Arlington, VA (USA); Grier Partnership, Bethesda, MD (USA)). 12 Jun 1986. Contract FG01-85CE63424. 348p. NTIS, PC A15;3. Order Number DE88011596/JAW.

A questionnaire was developed to survey the states and compile for the first time comprehensive data on the fuel assistance activities and weatherization activities at the state level. A major concern was to identify all sources of funds for energy conservation and fuel assistance as well as to determine the scope of the programs nationwide. Information collected through the questionnaire and other sources of data on the programs available at the national level were reviewed. A further activity was the development of a profile of the eligible and recipient populations for the Low Income Home Energy Assistance Program. This is a comprehensive presentation of the resources and types of programs that are available to assist low income persons with their energy burdens. It also contains findings that demonstrate the weaknesses and strengths of those programs and policy recommendations that address them.

36569 **(DOE/CE/63502—T3-Pt.1) Energy-efficient manufactured housing in Chicago: Part 1, Industry assessment and business concept paper.** (Center for Neighborhood Technology, Chicago, IL (USA)). [1986]. Contract FG01-86CE63502. 87p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88009614/JAW.

The Center for Neighborhood Technology (CNT) is exploring the feasibility of manufactured housing in the City of Chicago. This preliminary analysis focusses on the potential for establishing a manufactured housing plant in Chicago from two perspectives: as an economic development and job creation venture, as well as a possible element in meeting the Chicago area's needs for affordable housing.

36570 **(DOE/CE/63502—T3-Pt.2) Energy-efficient manufactured housing in Chicago: Part 2, Building code, construction and energy efficiency issues.** Rangelov, L. (Illinois Univ., Chicago (USA). Energy Resources Center). Dec 1986. Contract FG01-86CE63502. 87p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88009616/JAW.

The Center for Neighborhood Technology (CNT) with funding from federal and state sources is involved in a broad study examining the many economic and social issues of deteriorating neighborhoods. This study is a portion of the major study, conducted by CNT, which will specifically focus on the adaptability of manufactured housing for the City of Chicago. Specifically, this report focuses on: building codes regulating the construction of manufactured housing; manufactured housing construction process; current energy efficiency of manufactured housing; and Illinois manufacturers. Major conclusions of this report are: manufactured housing, with some changes in the construction process, can comply to the City of Chicago Building Code; and a high level of energy efficiency can be achieved in manufactured housing because of the controlled environment inherent in the construction of manufactured housing, because efficient products and techniques can be easily incorporated.

36571 **(DOE/CE/63502—T3-Pt.3) Energy-efficient manufactured housing in Chicago: Part 3, Building code and energy efficiency appendices.** Rangelov, L. (Illinois Univ., Chicago (USA). Energy Resources Center). Dec 1986. Contract FG01-86CE63502. 165p. NTIS, PC A08;3. Order Number DE88009615/JAW.

Rules and laws governing manufactured housing and mobile homes in Chicago, Illinois are documented. (BCS)

36572 **(DOE/CE/63502—T4) Feasibility analysis/business plan for proposed residential balancing venture.** (Center for Neighborhood Technology, Chicago, IL (USA)). 24 Dec 1986. Contract FG01-86CE63502. 127p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88009613/JAW.

To assess the feasibility of a residential balancing venture, Charles Rial and Associates determined the market potential for such a service, reviewed the efforts of the Chicago Energy Savers Fund, and interviewed engineering firms and heating and boiler contractors. Based on our findings, it was determined that a stand-alone venture that offers balancing as its only service will not reach a broad enough market to support a break-even operation, and therefore, does not represent a feasible venture opportunity. A more feasible approach would involve a joint-venture between an established heating/boiler contractor and a cbo. A summary of the findings that led to this conclusion are included.

36573 **(DOE/CE/63521—T1) Partnerships in Low-Income Residential Retrofit (PILIRR): Partnership model for the weatherization of low-income, multi-family housing.** Hunter, D.; Yasutake, B. (Washington State Dept. of Community Development, Olympia (USA). Div. for Community Services). Apr 1988. Contract FG01-86CE63521. 208p. NTIS, PC A10;3. Order Number DE88009667/JAW.

This report presents the nature, procedures, and product of the Washington State Partnership in Low-Income Residential Retrofit (PILIRR) Project (the Project). The Washington State Department of Community Development (DCD) was named one of five recipients, nationwide, of funds for the US Department of Energy (DOE) Partnerships in Low-Income Residential Retrofit (PILIRR) project. In August, 1987, DCD proposed to research and demonstrate the leveraging of public and private resources to weatherize low-income multi-family housing. This Partnership Model (the Model) is the final product of the Project. Designed as a resource guide, the Model will will be used by weatherization contractors [i.e., Community Action Programs (CAPs)] to assist in leveraging activities. Included are examples of successful partnerships, a collection of possible funding sources, marketing tips, and a promotional brochure.

36574 **(DOE/CH/10248—2) Weatherization assistance program monitoring fiscal year 1986: Final report.** Braslau, D.M.; Swigert, L.J.; Walsh, J.H. (B and M Technological Services, Inc., Cambridge, MA (USA)). Jul 1987. Contract AC02-85CH10248. 29p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010813/JAW.

The Fiscal Year 1986 Weatherization Assistance Program was monitored in three midwestern States. Program monitoring is required by the Energy Conservation and Production Act (PL 94-384) and the regulations at 10 CFR 440 to ensure effective provision of weatherization assistance to low-income persons. The focus of the monitoring was on 23 subgrantees selected by CH/SLCP and distributed throughout the States of Ohio, Michigan, and Minnesota. Separate reports on the monitoring completed in each State were previously submitted to CH/SLCP. This Final Report presents an overview and summary of the work performed by B & M, including discussion of the findings of the monitoring team regarding the accomplishments and problem areas observed among the subgrantees visited. All areas revealed opportunities for improvement among the subgrantees with assistance from the various State Offices. Recommendations to improve subgrantee operations were presented in the reports prepared for CH/SLCP on the monitoring in respective States. Some additional recommendations are presented at the conclusion of this report.

36575 **(DOE/EI/20471—T2) Massachusetts Executive Office of Energy Resources. Final report. No. 2 home heating oil program 1987/88.** (Massachusetts Executive Office of Energy Resources, Boston (USA)). 1988. Contract FC01-87EI20471. 16p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012125/JAW.

During the 1987/88 heating season, the Massachusetts Executive Office of Energy Resources (EOER) participated in the joint data collection program between State Energy Offices and the federal Department of Energy (DOE) Energy Information Administration (EIA). The purpose of the program was to collect and monitor retail and wholesale prices and inventories of No. 2 fuel oil during October through May. Collection of price and inventory data served several functions. The information collected through this program allowed the federal and state governments to respond to consumer, congressional and media inquiries regarding No. 2 fuel oil. The data also provided policy decision-makers with timely and accurate data necessary to determine the adequacy of state level in-

ventories and prices. In addition, the program assisted the states in the development of consistent data bases. A network for the states and the EIA to communicate the data was also established through the program. The final report summarizes the results from the price and inventory surveys conducted in Massachusetts over the 1987/88 heating season. Factors which influenced these results are also discussed.

36576 **(DOE/HWP—55) Technical and economic assessment for asbestos abatement within Facility 20470, Wright-Patterson Air Force Base, Ohio.** Gibson, S.M.; Ogle, R.B. (Oak Ridge National Lab., TN (USA)). Mar 1988. Contract AC05-84OR21400. 167p. (ORNL/TM—10745). NTIS, PC A08;3. Order Number DE88007881/JAW.

This report presents the results of a technical and economic assessment of available alternatives for asbestos abatement within Facility 20470 at the Wright-Patterson Air Force Base in Dayton, Ohio. Each alternative was screened on the basis of technical feasibility, environmental impact, economics, and fulfillment of the IRP goals. Four alternatives for study are: establishing a special operations and maintenance program; enclosure; encapsulation with sealants; and removal, disposal, and replacement. Each of these alternatives was assessed for capability to control the release of asbestos fibers within Facility 20470. Alternatives 1 and 4 were determined to be acceptable, while Alternatives 2 and 3 were found to be unacceptable. 2 refs., 6 figs.

36577 **(DOE/ID/12584—18) Procedure manual for the estimation of average indoor radon-daughter concentrations using the filtered alpha-track method.** George, J.L. (UNC Geotech, Grand Junction, CO (USA)). Apr 1988. Contract AC07-86ID12584. 17p. (UNC/GJ—40(TMC)). NTIS, PC A03/MF A01;1; GPO Dep. Order Number TI88010380/JAW.

One of the measurement needs of US Department of Energy (DOE) remedial action programs is the estimation of the annual-average indoor radon-daughter concentration (RDC) in structures. The filtered alpha-track method, using a 1-year exposure period, can be used to accomplish RDC estimations for the DOE remedial action programs. This manual describes the procedure used to obtain filtered alpha-track measurements to derive average RDC estimates from the measurements. Appropriate quality-assurance and quality-control programs are also presented. The "prompt" alpha-track method of exposing monitors for 2 to 6 months during specific periods of the year is also briefly discussed in this manual. However, the prompt alpha-track method has been validated only for use in the Mesa County, Colorado, area. 3 refs., 3 figs.

36578 **(DOE/MI—0010-Vol.3) Instructor training manual: For use with energy conservation practices participant manual.** (Assignment Group, Rockville, MD (USA)). May 1988. 20p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010726/JAW.

This manual is a tool for instruction to residential building tenants who are interested in enhancing energy conservation practices in their homes. (BCS)

36579 **(DOE/MI—0010-Vol.4) Conservation curriculum: Guide for public housing residents and renters.** (Assignment Group, Rockville, MD (USA)). May 1988. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010727/JAW.

This brief guide presents several examples of energy saving measures that can be used by public housing residents and renters. (BCS)

36580 **(DOE/NBM—8010176) Final report to the Champlain Valley Office of Economic Opportunity on Department of Energy energy-related business development grant: Final report.** (Memphremagog Group, Newport, VT (USA)). 23 Mar 1987. 86p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88010176/JAW.

This study assessed the feasibility of developing an energy-related business to enhance the capabilities of Champlain Valley OEO's existing weatherization program. It was decided that, instead of one new business, two separate companies should be developed, a non-profit energy service company and a for-profit energy contracting company. Plans were developed for both companies.

36581 **(DOE/SF/11996—T1) [Laser diagnostics of gas discharge tubes]: Final technical report.** Stroke, H.H. (New York Univ., NY (USA)). 28 Mar 1988. Contract AC03-84SF11996. 5p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88008124/JAW.

The project was set up to develop the basic instrumentation and methods for optical diagnostics of plasmas. Specifically, the work was to permit the measurement of the radial distribution of atomic and ionic species in gas discharge tubes as exemplified by household fluorescent lamps. The aim is obviously to attempt to increase the efficiency by control of the discharge parameters. This report describes the system and results.

36582 **(DTH-LV-MEDD—185) Computer programmes for simulation of passive solar heating.** Christensen, J.E. (Danmarks Tekniske Hoejskole, Lyngby. Lab. for Varmeisolering). Oct 1987. 123p. (In Danish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752910/JAW.

In Denmark, several computer programs have been developed and used to simulate the energy consumption and the indoor climate in buildings. However, these programs are less suitable for investigation of passive solar systems since they can only provide analysis of a single room and cannot sufficiently consider the thermal effect of the heat-accumulating mass of the building. Therefore, the main purpose of this project has been to select suitable programs, and, if necessary, re-edit them specificly for passive solar energy simulations. The transfer of another American program, SERI-RES, into a PC-dode - the program SUNCODE - makes this program very interesting. That is the reason why it has been included in the last part of the project. However, the greatest importance to the project is related to the adaption and use of BLAST. A description is given of the BLAST-system, and the computer work carried out by the author with the system. This work has primarily consisted in the development of an independent program, JC-WRITER, which is able to read the output files from BLAST, adapt these data and print them in the formats wanted. BLAST and SUNCODE have been compared and validated using experimental results from a Canadian test cell, and from a Danish test house, one of the "Smakkebo" houses at Elsinore. In both cases there has been a good accordance between the measurements and the calculations of the energy consumptions. As for the temperatures, the agreement was relatively good for both cases. However, further investigations will be necessary as the temperature fluctuations in the Canadian test cell were to small, and as Smakkebo manifested some uncertain factors. Finally, a number of current projects in which the author has participated with BLAST calculations are briefly described. 65 refs. (SM).

36583 **(EMR—1987) R-2000 student design challenge, 1986-1987.** (Department of Energy, Mines and Resources, Ottawa, Ontario (Canada)). 1987. 61p. (MICROLOG—88-01286). Ontario Ministry of Energy, Communications Services Group, 62 Wellesley St., West, Main Floor, Toronto, Ont., Canada M7A 2B7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In order to promote design of energy efficient houses in Ontario, a yearly competition for architecture students has been initiated. Participants must design a detached house to R-2000 standards, and the designs submitted must be practical to build, marketable, and economical; the construction materials and techniqes have to ensure long term reliability and low maintenance cost, and the homes have to be affordable by an average-income family. This report presents the best designs submitted. Each house and its components are described, illustrated, and evaluated. HOTCAN computer calculations were used for modeling in many of the designs.

36584 **(EUR—10433-EN) Investigations of the performance of domestic central heating systems and of reductions in building fabric losses. Final report.** Rayment, R. (Commission of the European Communities, Luxembourg. Directorate General Information Market and Innovation; Building Research Establishment, Watford (UK)). 1986. 147p. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Energy.

A description of the characteristics of a pair of houses in Oxfordshire (UK) and a set of 8 houses in Cambridgeshire (UK), specially instrumented, equipped with simulated occupancy and designed to provide an automatically operating test bed for accurately assessing energy conservation measures under realistic conditions, is presented. The description includes the constructional, thermal and air-infiltration properties together with the gas central heating systems and controls.

36585 **(EUR—10449-EN-Pt.1) Development of energy efficient electrical household appliances. Pt. 1. Refrigerators. Final report.** Guldbrandsen, T.; Heeboell, J.; Mehlsen, K.; Noergaard, J. (Commission of the European Communities, Luxembourg. Directorate General Information Market and Innovation; Danmarks Tekniske Hoejskole, Lyngby). 1986. 64p. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Energy.

This final report is part one out of three parts describing a project on efficient household appliances. Earlier analyses indicated significant potentials for saving electricity used for refrigeration purposes. The work reported here was undertaken to verify those conservation potentials by designing and building low energy refrigerator prototypes. A 200 liter low energy refrigerator with no freezer compartment was designed. A few prototype cabinets were built with better insulation than usually. A compressor with improved performance was used in the refrigeration system installed in the cabinets. Furthermore, the evaporator and condensor were improved. The system is automatically defrosting. Electricity consumption for the low energy refrigerator was found to be 102 kWh/year under standard test conditions. This is about 20% of what a typical 1975-refrigerator of same size consumes, and 40% of what one of the best on the market consumes. Experimental tests indicated that the insulation standard was better than anticipated, while the refrigeration system was performing below the expected. Further reduction in electricity consumption is possible through a better adapted compressor, better control systems etc.

36586 **(EUR—10449-EN-Pt.2) Development of energy efficient electrical household appliances. Pt. 2. Cooking. Final report.** Holck, J.; Goldschmidt, L.B.; Heeboell, J.; Pedersen, N.H. (Commission of the European Communities, Luxembourg. Directorate General Telecommunications, Information Industries and Innovation; Danmarks Tekniske Hoejskole, Lyngby). 1986. 78p. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Energy.

The work has been focussed on the development of a small, highly insulated electric oven, low heat-capacity hot plates and an accurate electronic thermostat for electric hot plates. It has proved, that energy saving ovens can be built with good energy economy and at a reasonable price, so it has been estimated that there is a market for these ovens. Experiments with low heat-capacity hot plates made of aluminum have been carried out. Theoretical calculations have indicated possible energy savings around 20%, but the difficulties in producing such hot plates have proved to be considerable and requiring know-how and experience outside that of the laboratory. An experimental microprocessor based setup has been built for the investigation of different principles of control. Two principles have been examined: direct substitution in the model equations and prediction of the pan bottom temperature. The first principle has been tested experimentally, but the results have shown that the model, on which the control has been based, does not give an adequate description of the system. The second principle has appeared promising in computer simulations, but these results have not been verified experimentally.

36587 **(EUR—10449-EN-Pt.3) Development of energy efficient electrical household appliances. Pt. 3. Washing machines. Final report.** Heeboell, J.; Noergaard, J. (Commission of the European Communities, Luxembourg. Directorate General Information Market and Innovation; Danmarks Tekniske Hoejskole, Lyngby). 1986. 44p. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Energy.

This third part of the final report is on washing machines. Earlier analyses indicated significant potentials for saving electricity in the process of washing clothes (5 and 6). Three major measures could be applied: 1) Reducing the amount of water, 2) reducing the temperature and 3) taking in hot water heated by other (and cheaper) energy sources than electricity. We have used most of our efforts on 1) but with some considerations given to 2). The project was intended to be carried out in cooperation with a manufacturer of washing machines, Voelund Husholdningsapparater A/S, but this factory closed down shortly after the project was started. During the period of the project, a new washing process and a prototype washing machine has been developed and tested. The basic change in this washing process is less use of water during the period with high temperatures. In a second stage the process was further improved into a resource efficient (RE-)process which uses less detergent and less water for rinsing in addition to the energy savings. Washing quality is found to be similar to that of average, 1982-washing machines. The annual electricity savings would be 140 kWh when compared to average 1982-machines. The necessary extra costs for a machine with this washing option would be paid back in saved electricity in 6.5 years, but including the detergent and water saved, the payback period is estimated to be less than 4 years. Since there is less mechanical action in this RE-process, it is likely that the wear of the clothing will be lower than usual.

36588 **(EUR—10552-EN) Natural ventilation in large and multicelled buildings: Theory, measurement and prediction. Final report (for the period: 1st October 1981 to 30th June 1984).** Perera, M.D.A.E.S.; Walker, R.R.; Hathaway, M.B.; Oglesby, O.D.; Warren, P.R. (Commission of the European Communities, Luxembourg. Directorate General Telecommunications, Information Industries and Innovation; Building Research Establishment, Watford (UK)). 1986. 232p. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Energy.

In this programme of work, methodologies for determining infiltration rates of large and complex buildings have been established. Solutions to this, hitherto, intractable problem have been obtained using a combination of theoretical and experimental studies. Theoretical considerations suggested that comprehensive information regarding interzonal air movements might be obtained from experimental techniques using multiple tracer gases. Field measurements to determine interzonal flows were carried out in office buildings using automated measurement systems developed for this purpose. It was recognized that, in most circumstances, simpler techniques, which would give less comprehensive but nevertheless useful information, were needed. Such a simplified technique has been developed. Theoretical and experimental work showed that, with this technique, it is probably sufficient to seed part of a complex building with a single tracer gas in order to measure the overall infiltration rate to a good approximation. Prediction models have also been used to determine the effectiveness of draughtstripping windows on the energy consumption of an office building. The predicted infiltration rates compared well with measured values. Energy calculations showed that, for this particular building, draughtstripping windows has reduced by 21% the seasonal gas consumption.

36589 **(KTM/E-D—84C) Efficient and the economical utilization of the electrical systems of buildings.** Elkala, E. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). 1987. 72p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752819/JAW.

The objective of the third stage of the research project "the Energy economy of the buildings" is to create the instructions for

drawing up electrical plans with consideration of an economical and effecient utilization of electrical devices. Therefore the instructions include the planning and the documentation of the system significant from the point of view of the energy consumtion. With the choice of the right planning solutions the planner form the basis for an efficient and economical utilization of energy. The selection between alternatives requires consideration of not only the investment costs but also the costs of utilization and maintenance. The utilization costs can be effected by improving the quality of planning and developing professional skills. The planning must seek and develope new and more effecient solutions and draw attention to such control solutions which make possible the due utilization of electrical devices and equipments. The documents answering for the realization and serving the utilization and the maintenance, such as the final drawings, records of measuring and inspections, use specifications and maintenance instructions, convey to the organization responsible for the upkeeping the original idea for the utilization and the maintenance of the building. The documents also create premises for a systematical practice and the right maintenance habit.

36590 **(KTM/E-D—143) Test method for energy consumption with simulated occupancy.** Heinola, R.; Pukkila, I.; Pekkonen, J.; Lindqvist, P.; Schreck, T. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). Aug 1987. 89p. (In Finnish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752829/JAW.

The estimation of operating costs of a building and research for building materials and products call for comparable annual energy consumption data. Results given by conventional calculation methods are often unsatisfactory. Energy models of buildings can be derived from measurement data by solving parameters that characterize their their thermal properties. The data is produced during a few days' measurement period and analysed with linear regression analysis. The model described in this study has the following parameters: indoor/outdoor temperature difference, lagged temperature difference, room temperature variation, solar radiator, wind effect, and stack effect. These parameters and criteria for model reliability are solved from the data. The annual energy consumption of the building is calculated with these parameters and hourly weather data. A minimum value or variation is necessary for the outdoor conditions. Indoor/outdoor temperature difference must be at least 10-15 deg C. Diurnal variation of outdoor temperature must be at least 5-10 deg C. The measurement period should include at least one sunny day. There should be some variation of indoor temperature. The effective gap area, which represents the building envelope leaks, can be determined if wind velocity is 3 m/s or higher. The internal loads and occupant effects are simulated by heaters programmed to be on and off to produce a typical load profile. Seven single family houses and one apartment house were tested. In the apartment house, no simulation of internal loads and occupants was conducted as the house was occupied during the measurement period. There is some variation in the parameters of models from different periods. Nevertheless, the predict error of accepted 48 hour models is less than 5% for the measurement period.

36591 **(KTM/E-D—144) Facade as a solar collector in a forced air heated office building.** Laitinen, J.; Puumalainen, H. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). Sep 1987. 57p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753326/JAW.

The object of this study was the new office building of Joensuu Electricity and Telephone Board, which was completed 1985. Forced air heating was selected as a heating system and there were located small electric radiators beneath the windows in rooms to make individual control possible in rooms and prevent possible cold draght from windows. There was utilized solar energy in building by using southern wall as a solar collector. This solar preheated outdoor air is introduced into the air conditioning system whenever space heating is needed in the building. The purpose of the measurements was to solve the operation of the operation of the air-conditioning and heating system in different circumstances and to find out how much energy was taken advantage by using this kind of facade. The total consumption of heating energy in the building during measurements of a year was 354.3 MWh/a = 39.1 MWh/m"3,a. 18.6% was obtained from the glass facade. Best period in heating season was end of spring, when air may warm up in collector from -20 deg C to +20 deg C. The consumption of heating electricity was 65.0 MWh/a = 7.2 kWh/m"3,a. The consumption of electricity not including heating electricity was 330.9 MWh/a = 36.6 kWh/m"3,a. The investment costs of forced air heating were in this building same class of magnitude as traditional heating and air-conditioning system would have cost. The costs of the glass facade were 118.000 mk = 204 mk/m"2. However, the glass facade didn't cause extra costs; another kind of facades could have been even more expensive. Preheating of supply air in space behind glass facade have proved to be profitable in this building. Because of the results got in this study, using of facade to preheat supply air would be a good alternative in small and middle-sized office buildings and for example in schools.

36592 **(LBL—23287-Rev.) Influence of glazing selection on commercial building energy performance in hot and humid climates.** Sullivan, R.; Arasteh, D.; Sweitzer, G.; Johnson, R.; Selkowitz, S. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 19p. (CONF-8709245—1-Rev.). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011962/JAW.

From ASHRAE conference on air conditioning in hot climates; Singapore, Malaysia (3 Sep 1987).

This paper presents a comparative study in which commercial building perimeter zone electric energy (cooling, lighting, fan) and peak electric demand are analyzed as a function of window glazing type, with a particular emphasis on the use of glazings with wavelength-selective solar-optical properties. The DOE-2 energy analysis simulation program was used to generate a data base of the electric energy requirements of a prototypical office building module located in Singapore. Algebraic expressions derived by multiple regression techniques permitted a direct comparison of those parameters that characterize window performance in hot and humid climates: orientation, size, and solar-optical properties. Also investigated were the effects of exterior and interior shading devices, as well as interior illuminance level, power density, and lighting controls to permit the use of daylighting. These regression equations were used to compare the energy implications of conventional window designs and newer designs in which the type of coating and substrate were varied. The analysis shows the potential for substantial savings through combined solar load control and lighting energy use reduction with daylighting.

36593 **(LBL—23501) Computer simulation of natural ventilation airflow.** Byrne, S.J.; Fleury, B. (Lawrence Berkeley Lab., CA (USA); Ecole Nationale des Travaux Publics de l'Etat, 69 - Vaulx en Velin (France). Lab. Sciences de l'Habitat). Sep 1987. Contract AC03-76SF00098. 11p. (CONF-8709268—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009843/JAW.

From ASHRAE Far East conference on air conditioning in hot climates; Singapore, Singapore (3 Sep 1987).

The current limitations, as well as recent improvements, in the capability of computer simulation programs to model natural ventilation airflow through buildings are described. The advantages and limitations of two techniques{emdash}the mass balance approach and the finite domain approach{emdash}are discussed. Results are shown from two sets of simulations, using typical building configurations, to illustrate the usefulness of each technique in predicting wind induced ventilation rate.

36594 **(LBL—24161) A large scanning radiometer for characterizing fenestration systems.** Papamichael, K.; Klems, J.; Selkowitz, S. (Lawrence Berkeley Lab., CA (USA)). Nov 1987. Contract AC03-76SF00098. 11p. (CONF-8710322—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010354/JAW.

From Workshop on optical property measurement techniques; Ispra, Italy (27 Oct 1987).

A large scanning radiometer for measuring the bidirectional transmittance and reflectance of fenestration systems and components is described. Examples of measured data obtained for simple non-specular samples using the radiometer are presented. A method of obtaining the overall bidirectional properties of systems by calculation from scanning radiometer measurements of components is

suggested. Advantages and limitations of the method are discussed. The method appears promising.

36595 **(LBL—24704) A study of the interaction of NO_2 with carbon particles.** Gundel, L.A.; Guyot-Sionnest, N.S.; Novakov, T. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 21p. (CONF-871055—5; CONF-871055—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010778/JAW.

From 3. international conference on carbonaceous particles in the atmosphere; Berkeley, CA, USA (5 Oct 1987).

The interaction of NO_2 in air (0.5-35 ppM) with carbon particles led to three products: NO gas, and NO_2/sup {minus/} and NO_3/sup {minus/}, removed from the particles by water extraction. At 4 ppM or below, in dry or humid air, the product distribution, in relative molar amounts, was NO_3/sup {minus/} = $2NO_2$/sup {minus/} = 2NO. At 20 ppM and above, the relative amounts of products depended on the presence of water vapor: In dry air NO = $3NO_3$/sup {minus/} = $6NO_2$/sup {minus/}. In humid air NO = NO_3/sup {minus/} = $2NO_3$/sup {minus/}. For carbon slurries in water, [NO_3/sup {minus/}] = 6[NO_3/sup {minus/}] at an input concentration of NO_2 of 4 ppM. In comparison to carbon, alumina particles and glass beads removed NO_2 ineffectively. These results indicate that NO_2 oxidized the carbon particles while it was reduced to NO. NO_2 adsorbed at oxidized sites on the particles formed a surface species that was analyzed as nitrate. At high enough concentration of NO_2 (20 ppM and above), the interaction of NO and water vapor with the surface nitrate produced NO_2/sup {minus/}. In slurries NO, generated from interaction of NO_2 with carbon, reacted with surface nitrate or nitric acid in solution to form the relatively large quantities of nitrite. This work suggests that NO/sub x/ reactions with carbon in droplets or on wet surfaces could be important sources for the production of nitrous acid in the environment. 19 refs., 7 figs., 1 tab.

36596 **(LBL—25124) Determination and application of bidirectional solar-optical properties of fenestration systems.** Papamichael, K.; Klems, J.; Selkowitz, S. (Lawrence Berkeley Lab., CA (USA)). Mar 1988. 9p. (CONF-880615—3; CONF-880615—). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88010364/JAW.

From Solar '88: American Solar Energy Society annual meeting and 13th national passive solar conference; Cambridge, MA, USA (18 Jun 1988).

Accurate determination of the luminous and thermal performance of fenestration systems that incorporate optically complex components requires detailed knowledge of their radiant behavior. We describe a large scanning radiometer used to measure the bidirectional transmittance and reflectance of fenestration systems and components. We present examples of measured data obtained for simple non-specular samples. We describe a method of obtaining the overall properties of fenestration systems by calculation from scanning radiometer measurements of fenestration components. Finally, we describe the application of bidirectional solar-optical properties of fenestration systems to determine their luminous and thermal performance with respect to building energy consumption and occupants' comfort. We also discuss the advantages and limitations of the method, which appears to be promising.

36597 **(LBL—25127) Evaluation of radon reduction techniques in fourteen basement houses: Preliminary results.** Turk, B.H.; Harrison, J.; Sextro, R.G.; Hubbard, L.M.; Gadsby, K.J.; Matthews, T.G.; Dudney, C.S.; Sanchez, D.C. (Lawrence Berkeley Lab., CA (USA); Princeton Univ., NJ (USA). Center for Energy and Environmental Studies; Oak Ridge National Lab., TN (USA); Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab.). May 1988. Contract AC03-76SF00098. 24p. (CONF-880679—4). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010773/JAW.

From 81. annual meeting of Air Pollution Control Association; Dallas, TX, USA (1 Jun 1988).

This paper reports the preliminary results of a study of radon control techniques in 14 homes in New Jersey. The study was initiated to investigate the fundamentals of soil gas flow and radon entry into buildings and the factors that influence the entry rate, develop a diagnostic procedure for specifying appropriate and effective remedial measures, and better understand the operation of certain mitigation techniques and the parameters that affect them. Reported here is a description of the radon control work that was conducted in the houses and a summary of the results of that work. At this time, a detailed analysis of the relationship between the parameters affecting system performance has not been conducted. 9 refs., 10 figs., 6 tabs.

36598 **(LIU-TEK-LIC—1986-31) Optimal energy retrofits on existing multifamily buildings.** Gustafsson, S.I. (Linkoeping Univ. (Sweden). Dept. of Mechanical Engineering). Nov 1986. 155p. Linkoeping Univ. Library, S-581 83 Linkoeping, Sweden.

Linkoeping studies in science and technology.; (No. 91).

It is important to consider the building as an energy system when determining the retrofits done to the house. In Sweden today it is common to make both an extensive envelope retrofit and change the existing heating system to district heating. This is absolutely wrong, at least if the district heating company is using the short range marginal cost pricing system. Today it is also common to implement the retrofits due to its profitability. This is in most cases wrong. Starting e g with caulking and some insulation retrofits makes the building consume less energy, but this also means that it is impossible to install a heat pump with any profitability. The right strategy perhaps should have been to install the heat pump and skip all of the envelope retrofits. It is shown that much more insulation shall be placed on the climate shield than is common today. It is important that the insulation measures are implemented at the same time that other things are done e g the wall. Most insulation retrofits are only profitable if that is the case. Complicated window constructions will almost never be profitable as an optimal strategy unless the windows have to be changed for other reasons. The same can be said about the exhaust air heat pump retrofit. The cheapest retrofit, the caulking of windows and doors, is almost always profitable.

36599 **(LUTKDH/TKKA—7003-1-83(1986)) Calculation methods for sorption heat pumps using enthalpy-concentration charts.** Eriksson, K.; Jernqvist, Aa. (Lund Inst. of Tech. (Sweden). Dept. of Chemical Engineering). Jun 1986. 103p. (In Swedish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752913/JAW.

Calculation methods for absorption heat pumps and heat transformers are described and graphically demonstrated in enthalpy-concentration charts. Special attention is payed to the estimation of pressures, temperatures, heat factor and circulation ratio. Every unit involved - generator/rectifier, absorber, condenser, heat exchangers, pumps and expansion valves - described in detail. Mass- and energy flows are graphically calculated. Efficiencies, especially for absorber and generator, are based only on temperatures. These efficiencies take into consideration the varying absorber and generator temperatures which should be exploited. Approximate values of temperature differences, circulation ratio, heat factor and efficiencies for different running conditions are given. Calculation examples for the absorption heat pump as well as the heat transformer illustrate the graphical method, which is especially suitable for preliminary calculations such as for instance pre-projecting. (authors).

36600 **(NEI-DK—62) Achieving substantially reduced energy consumption in European type refrigerator.** Guldbrandsen, T.; Norgard, J.S. (Danmarks Tekniske Hoejskole, Lyngby. Fysisk Lab. 3). May 1986. 13p. (CONF-8605334—1). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752835/JAW.

From 37. annual international appliance technical conference; Lafayette, IN, USA (6 May 1986).

For several years the Energy Group at Physica Laboratory III has been working on improving energy efficiency of household appliances. Part of the work is analytical, but in recent years also experimental work has been carried out, especially on refrigerators. In Europe it is common to have refrigerators with + 5 deg. C and freezers with -18 deg. C as two separate units. This is appropriate from an energy conservation point of view, and we have therefore investigated a typically sized 200 litres refrigerator with automatic defrosting but no freezer compartment. At present one such proto-

type at our laboratory shows an electricity consumption of 82 kWh/year, according to European standard test procedures. This is around 45% of the consumption for the best model on todays Danish market with the same features (or 16% of what was typical in 1973). The costeffectiveness of our improvements seems good. The paper describes how our prototype is designed to achieve the savings by 1) lowering transmission loss by moderately increasing insulation thickness and 2) increasing COP by reducing temperature differences between heat exchangers and the surrounding air. The reduced temperature differences are in turn obtained by redesigning the heat exchangers for larger sizes and larger heat capacities. Although a COP value of 2.3 is attained there is still room for improvements towards the value of 14 for a thermodynamically ideal system.

36601 **(NEI-FI—35) Checking and the testing of refrigerating systems.** Kaappola, E. (Insinoeoeritoimisto Air-Ix Oy, Tampere (Finland)). May 1987. 53p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752838/JAW.

This work deals with the cheking and the testing of refrigerating systems in practice. This is aimed as a quidebook for persons working in the field. However the tests should be made only by the persons who have the necessary technical knowledge and experience. The checking of refrigerating system is described step by step. Information for important points is described in such way that also beginners can use it. The testing of refrigerating systems is described in general. That part includes information for organization of tests, measurement of refrigerating capacity, measurement of energy consumption, measuring instruments, tolorances and statement of result.

36602 **(NRC/BR—117) Net annual heat loss factor method for estimating heat requirements of buildings.** Mitalas, G.P. (National Research Council of Canada, Ottawa, Ontario. Div. of Building Research). Nov 1976. 13p. (CE—01487). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

The development of energy budget standards for buildings makes it necessary for designers to produce accurate estimates of the amount of energy required to heat a building. The most widely used method of calculating annual heating requirement is the ASHRAE degree-day procedure. This paper presents a modification of the degree-day method to allow designers to take more accurate account of: solar radiation incident on a building surface, variation of solar energy gained through windows, variation of air infiltration rate, and the heat generated by inside activity and its effect on building energy needs. This modified degree-day method is called the Net Annual Heat Loss Factor (NAHLF) method of estimating heat requirements of buildings. It is based on the fact that the total annual building heat loss can be separated into the following four components: window heat loss, opaque wall and ceiling heat loss, air infiltration-ventilation heat loss, and basement (below ground) heat loss. Each of these heat loss components can be calculated separately using NAHLF. This paper describes how these factors have been evaluated and how they can be used to estimate net annual heating requirements for simple buildings. Total house heat loss (except for basement below grade) calculated by the ASHRAE method compares well with the total heat loss componets calculated by the two methods, however is not as good as the comparison of the total losses where the highest difference is in window and infiltration components. 7 refs., 8 figs., 4 tabs.

36603 **(NRC/BR—NRC105) Determining the optimum thermal resistance for walls and roofs.** Stephenson, D.G. (National Research Council of Canada, Ottawa, Ontario. Div. of Building Research). Jan 1976. 13p. (CE—01485). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This paper provides information about deciding how much insulation should be used for residential walls and roofs. The approach suggested takes account of inflation and the expected increase in the cost of fuel during the lifetime of a building. The economic analysis used for this study is straight forward: the annual heat loss through unit area of a wall or roof is expressed as a function of the thermal resistance, and the cost of providing this amount of heat for the lifetime of a building is taken as the discounted present worth of the series of annual payments that would be required to purchase this heat. The cost of constructing walls and roofs with different resistance values is estimated and the optimum resistance is taken as the one that has a minimum total cost, i.e., the lowest sum of first cost plus the present worth of the heat that would pass through a wall or roof. It is concluded that there are two key prices of data that have to be established before the optimum heat resistance can be determined: the incremental cost of constructing walls or roofs with various values of R in excess of 12.5, and the value of the present worth factor that should be used for converting future fuel savings into a current lump-sum value. On the basis of the data assumed in this study it appears that an R=20 wall would be appropriate for most parts of Canada. 1 ref., 3 figs., 1 tab.

36604 **(NYSERDA—87-31) Low-cost conservation measures delivery service: A systematic approach for providing weatherization services: Final report.** (New York City Dept. of Housing Preservation and Development (USA)). Oct 1987. 72p. New York State Energy Research and Development Authority, Two Rockfeller Plaza, Albany, New York 12223;3. Order Number TI88010323/JAW.

This report gives an account of the Conservation Delivery Service Multi Family Buildings project and its activities by topic. Where applicable, there is an evaluation and recommendations section which contains the HPD Energy Conservation Unit (ECU) appraisal of the activity and how it might be conducted in future projects. While this report has primary relevance to New York City (NYC) conditions, it should prove useful to planners and managers in other cities with aging multi family housing stock. A comparison report deals with the Conservation Measures Delivery Service program as it treated 1-4 dwelling unit buildings during the same period as the multi family program was operating.

36605 **(ORNL/M—530) Building Thermal Envelope Systems and Materials (BTESM) and research utilization/technology transfer: Monthly progress report, March 1988.** Samples, S.D.; Coleman, G.L. (comps.). (Oak Ridge National Lab., TN (USA)). Mar 1988. Contract AC05-84OR21400. 37p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010735/JAW.

The Monthly Report of the Building Thermal Envelope Systems and Materials (BTESM) Program is a monthly update of both in-house ORNL projects and subcontract activities in the research areas of building materials, wall systems, foundations, roofs, building diagnostics, and research utilization and technology transfer.

36606 **(PB—88-183025/XAB) Advanced energy system program. Annual report, June 1986-February 1987.** Trester, K. (Allied-Signal Aerospace Co., Torrance, CA (USA). AiResearch Los Angeles Div.). Jun 1987. 119p. (DOC—87-60676). NTIS, PC A06/MF A01.

The objectives of the program are to design, develop, and demonstrate a natural-gas-fueled, highly recuperated, 50-kW Brayton-cycle cogeneration system for commercial, institutional, and multifamily residential applications. Recent marketing studies have shown that the Advanced Energy System (AES), with its many unique and cost-effective features, has the potential to offer significant reductions in annual electrical and thermal energy costs to the consumer. Specific advantages of the system that result in low cost of ownership are high electrical efficiency (34%, LHV), low maintenance, high reliability, and long life (20 years). Significant technical features include: (1) an integral turbogenerator with shaft-speed permanent magnet generator; (2) a rotating assembly supported by compliant foil air bearings; (3) a formed- tubesheet plate/fin recuperator with 91% effectiveness; and (4) a bi-directional power conditioner to utilize the generator for system startup. The planned introduction of catalytic combustion will further enhance the economic and ecological attractiveness.

36607 (PB—88-191796/XAB) Guidelines for factory-building design. Part 4. Air quality. Part 5. Fire protection. Senior, J. (Council for Scientific and Industrial Research, Pretoria (South Africa). National Building Research Inst.). 1985. 80p. NTIS, PC E06/MF E06.

Summary in Afrikaans. See also PB—83-245514; North American Continent sales only.

Contents include: Part 4: air quality (historical background, legislation, composition of the factory air: oxygen/carbon dioxide, odors, air contaminants and their industrial sources, air contaminants and respiratory diseases, monitoring air quality in factories, explosion hazards, control of airborne contaminants, external pollution, personal respiratory protection); Part 5: fire protection (nature of the fire hazard, causes and effects, the control of fire, building design, escape, precautionary measures, protection against fire).

36608 (PB—88-192463/XAB) Flame roll-out study for gas-fired water heaters. Kao, J.Y.; Ward, D.B.; Kelly, G.E. (National Bureau of Standards, Washington, DC (USA). Building Environment Div.). Mar 1988. 159p. (NBSIR—88/3724). NTIS, PC A08/MF A01.

Five gas-fired water heaters were tested in laboratory with simulated home conditions to evaluate their flame roll-out characteristics. Simulated variables were flue blockage, space pressure depression, access-door status and other related factors. Test results were compared with those based on the proposed American National Standards Institute (ANSI) test method. The testing concludes that, in addition to flue blockage, pressure depression and door status are major factors in inducing heater flame roll-out; that poor draft-hood performance contributes to the likelihood of flame roll-out; that the proposed ANSI test method should add a temperature criterion for determining flame roll-out; that the proposed ANSI blocked-flue test appears to be adequate for units equipped with thermal-spill switches located at their access-doors area. Recommendations are made that the Consumer Product Safety Commission (CPSC) and the ANSI subcommittee on water heaters consider also requiring the interlocking of access doors with water-heater operation, the use of temperature sensing as a means of detecting flame roll-out, and the use of improved draft-hood designs and draft-hood performance testing to reduce the chances of flame roll-out.

36609 (PB—88-195268/XAB) Residential construction code impacts on radon. Galbraith, S.; Brennan, T.; Osborne, M.C. (Camroden Associates, Rome, NY (USA)). Apr 1988. 12p. NTIS, PC A03/MF A01.

The paper discusses residential construction-code impacts on radon. It references existing residential construction codes that pertain to the elements of construction that impact either the ability to seal radon out of houses or the ability to achieve good soil ventilation for radon control. Several inconsistencies in the codes that will impact radon resistant construction are identified. Resolution of these resulting radon issues is necessary before specification-style building codes can be developed to achieve radon-resistant construction.

36610 (PNL—6525) An annotated bibliography of completed and in-progress behavioral research for the Office of Buildings and Community Systems. Weijo, R.O.; Roberson, B.F.; Eckert, R.; Anderson, M.R. (Pacific Northwest Lab., Richland, WA (USA)). May 1988. Contract AC06-76RL01830. 119p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88011360/JAW.

This report provides an annotated bibliography of completed and in-progress consumer decision research useful for technology transfer and commercialization planning by the US Department of Energy's (DOE) Office of Buildings and Community Systems (OBCS). This report attempts to integrate the consumer research studies conducted across several public and private organizations over the last four to five years. Some of the sources of studies included in this annotated bibliography are DOE National Laboratories, public and private utilities, trade associations, states, and nonprofit organizations. This study divides the articles identified in this annotated bibliography into sections that are consistent with or similar to the system of organization used by OBCS.

36611 (SNV—3104) Outdoor noise from heat pumps in houses. Bodlund, K. (National Swedish Environmental Protection Board, Solna). 1986. 64p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752941/JAW.

Noise levels were measured outdoors at 12 heat pump installations in one-family houses at the site, and on neighbour's plots. Involved persons were interviewed in order to find out if and how the noise levels were disturbing. The disturbances have been related to the frequency spectrum of the noise and it was found that noise levels expressed in dBA agree well with the subjective experiences. A suggestion is finally given for classifying the heat pump noise and giving relevant installation recommendations for each class. With 25 refs.

36612 (STU—83-3876) Heating system for small houses. Fehrm, M. (Swedish National Board for Technical Development, Stockholm). 15 Aug 1986. 7p. (In Swedish). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88752976/JAW.

Modern swedish houses with good insulation have so small heat requirements that air heating systems may be used. In this project the use of plastic pipes with 50mm diameter for heat distribution has been studied. It was found that such piping has capacity enough for the heat distribution, but that other considerations give unfavourable results for this system, i.e. certain components are relatively expensive (joints, bends, silencers, distribution boxes), the flexibility is low, and, the system produces noise due to the high air velocities. (L.E.).

36613 (TKK-KO/LVI—B14) Model test of air-exchange efficiency. Krzysztof, K. (Helsinki Univ. of Technology, Otaniemi (Finland)). Apr 1987. 49p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752862/JAW.

The report provides a summary of the laboratory tests. The mixing air flow patter was studied. Three air flows were tested in a laboratory test room. The tracer gas technique and decay method were used. The indices of air exchange efficiency were calculated, namely: overall air exchange efficiency and room air mean age for the whole room; local ventilation indices and local mean ages of air at 10 points distributed throughout the room. Experiments were carried out in both isothermal and nonisothermal conditions. Based on the theory of similarity requirements a reduced-scale model, geomettrically similar to the laboratory test room, was built. Air flows and temperature differences were calculated for the model tests in order to make them comparable with the full scale and the tests were repeated. Air served in the model test as a working fluid (Pr=const.) and regrigerant 12 was used as the tracer gas both in the full scale and model tests. The ojective of the study was to determine the relation between the air exchange efficiency indices obtained in the model and on the full scale. The overall air exchange efficiencies and local ventilation indices were equal in the model and full scale when there was no short-circuiting. A new formula for calculating local mean ages on a full scale, based on a reduced scale model experiment, was developed.

36614 (TKK-KO/LVI—B16) Performance of ventilation in residential buildings. Ruotsalainen, R.; Majanen, A. (Helsinki Univ. of Technology, Otaniemi (Finland)). 1987. 153p. (In Finnish). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88752864/JAW.

The aim of this study was to survey the performance of ventilation in residential buildings. Particularly the effect of various ventilation systems on air-exchange rate in rooms, indoor air climate, satisfaction and health was studied. The research was carried out with field measurements and a questionnaire to inhabitants. Seven apartments in small houses and six apartments in block of flats were selected into the research. There were different kinds of ventilation systems in the apartments. The air-exchange rates in the dwellings varied a lot; the ventilation rates were from 0.1 to 0.7 1/h. Only in three dwellings the official minimum ventilation rate 0.5 1/h was achieved. The lowest air-exchange rates were measured in the dwellings where the mechanical ventilation system was usually not in operation. The ventilation rates were then only about 0.1 1/h. The ventilation rates were about 0.4-0.5 1/h in the dwellings with

natural ventilation. Closed bedroom doors reduced the air-exchange rate in the room, except in the dwellings with mechanical air supply into each room. A quiding correlation was found between the air-exchange rates of the dwellings and the satisfaction and health of the inhabitants. When the ventilation rate was low i.e. under 0.3 l/h, the inhabitants were usually not satisfied with the performance of the ventilation system. Similarly the symptoms of tiredness and the symptons from respiratory organs were more common, when the ventilation rate was low.

36615 (TKK-KO/LVI—B17) Survey about air velocities, fluctuation frequencies and turbulence intensities in dwelling and offices. Kovanen, K.; Majanen, A.; Siren, K. (Helsinki Univ. of Technology, Otaniemi (Finland)). 1987. 94p. (In Finnish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752865/JAW.

The purpose of the present study was to survey air velocities, fluctuation frequencies and turbulence intensities in dwellings and offices and discuss the influence of air distribution systems on the measured factors. The study was accomplished by making field measurements in 23 spaces with most typical ventilation and air distribution systems. The instrumentation was designed and built in the laboratory of Heating, Ventilating and Air Conditioning of Helsinki University of Technology. In order to analyse fluctuation frequencies a computer program, that uses Fast Fourier transform method, was developed. Generally the mean velocity and the turbulence intensity were in no obvious connection with the air distribution system. As an exception one can state the system with mechanical exhaust with supply to hall, where the mean velocities and the turbulence intensities were obviously lower than in other systems. In most spaces the mean velocities near the floor level were highest and correspondingly the turbulence intensities were lowest. In the dwellings the mean velocities were obviously lower than in the offices. The turbulence intensity varied remarkable. About 90% of the accepted values varied: from 25 to 50% at head level, from 20 to 45% at 15 cm above the floor level and from 15 to 40% at 5 cm above the floor level. The turbulence intensities were found to be higher in the winter conditions than in the summer conditions. The mean velocity and the standard deviation had no generally accepted relationship. Neither the spectra investigated had any predominant frequency in the range of 0.1-1.0 Hz.

36616 (TKK-KO/LVI—C31) Method for ventilation measurements. Saeteri, J.; Majanen, A. (Helsinki Univ. of Technology, Otaniemi (Finland)). 1987. 47p. (In Finnish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752866/JAW.

The aim of this study was to develope cheap and simple method for ventilation measurements in dwellings. The study is based on a previous report of field measurement equipment for ventilation effiency and air exchange rate (Aalto, Niemela, Toppila, Toosavainen: Ilmanvaihdon tehokkuuden ja ilmanvaihtuvuuden kenttamittauslaitteisto.1984. Indoor Climate Project, Institute of Occupational Health, Helsinki University of Technology, HVAC-laboratory, Report C:11. Here has been concentrated on the use of carbon dioxide as tracer gas and indicator tubes for the measurement of air exchange rate. Laboratory experiments in a test chamber has been made to test the applicability of carbon dioxide indicator tubes in ideal conditions and to compare results with the air exchange rate measured by multipoint measurement equipment using Freon-12 as tracer gas. Field measurements in three typical dwellings has been made to estimate the usability of the indicator tube method for measurements in situ. The method presented here is applicable for measuring air exchange rate in dwellings with natural or exhaust ventilation system. With his method 20% measurement inaccuracy is gained, measurement time varying from 2 to 3.5 hours dependent on the air exchange rate. To achieve the mentioned inaccuracy there must not be any other sources of CO_2 except the measurer in the room during the decay time. This measurement method is very suitable for de termining the ventilation rate in a single room. In the end of the report there is a detailed measurement instruction and a measurement record, with which the air exchange rate can be determined grafically.

36617 (TKK-KO/LVI—C38) Indoor air components and health. Part 2. Sammaljaervi, E. (Helsinki Univ. of Technology, Otaniemi (Finland)). 1987. 64p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752867/JAW.

This litterature review is a second one made during the Project "Indoor Air Quality and Ventilation Requirements". The review is based on the newer and older research material being gathered by the author within the last few years. First are presented most of the primary and well-defined indoor air pollutants with known health hazards. Second, the most important dynamic features of indoor spaces and their health effects are evaluated. The dynamic features are: tightness, air exchange, temperature, humidity, electro-magnetic fields and ions. Ambient air pollutants and weather changes are related to changes in the health qualities of indoor spaces. At last, a current state of Finnish indoor air research activities is presented. The most important health and comfort features of buildings are supposed to be: dusts in the indoor air, on the indoor surfaces, in and from the textiles, tightness of the space and to this related inadequate air exchange, smelling (organic) gaseous pollutants from building or surface materials and from furniture, unphysiological temperature and humidity relations especially druing the cold season, and smells, dusts and noise from outside. Older buildings may be flimsy, chilly and draughty. The direct electrical heating (with wall panels) is clearly a health hazard in reference to customary water base central heating. There exist no comprehensive surveys of the mold problems in Finnish dwellings. Dusts and irritant chemicals in working environment and the ones, often in much lower concentrations, in homes produce very similar symptoms and diseases. The negative physical features, even in very low power, in dwellings constitute a background nouse which makes people now more vulnerable for diseases and bad working capasity. The research of the physical indoor environmen and its impact on health is in primary stage. Today's research results are no transferable to different climatic zones.

36618 (VTT-TIED—752) Cold worked reinforcing bars in tensile test under high loading rate and low temperatures. Hyvoenen, T. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Sep 1987. 61p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752993/JAW.

The behaviour of reinforcing steels in rapid loadings, e.g. in piling, explosions, crashings, must be known for designing. There does not exist studied of such properties of reinforcing steels used in Finland. This report presents the behaviour of reinforcing steels in rapid tensile tests carried out at temperatures +20 deg C, -20 deg C and -60 deg C. The steels are tested with a pendulum which swings around a bearing on the one end, fixed on the roof and the other end catches the test bar and draws it broken. The tensile-time curve is recorded electrically and elongation is measured from works. The results show that strength values are about 1.5 x values in ordinary tensile tests at room temperature. Strengths increase a little with decreasing test temperature. Thus the elongation values are higher at temperatures +20 deg C and at -20 deg C, at -60 deg C temperature elongation decreases under the reference value by ordinary test.

36619 (VTT-TIED—789) Optimization method for managing a renovation project. Aikkila, A.; Hekkanen, M. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Nov 1987. 187p. (In Finnish). NTIS (US Sales Only), PC A09/MF A01. Order Number DE88752999/JAW.

The aim of the study was to create a systematics for mastering the components which improve the value of a building in a renovation project. The purpose was to create a controlling method to optimize the gain as efficiently as possible. The study was limited to the preliminary design phase of a renovation project. An evaluation method to measure the changing value of a building was developed using a prametrization of the features of a building. The parameters were given numerical values to describe the relative importance of each feature. An optimization was done between the various alternatives in renovating by comparing the results of the parametrization to the total renovation costs. An operational model for managing the most advantageous alternative in renovating was presented

for the preliminary design phase of a project. The model was exemplified by two case studies. They showed that the method is rather sensitive to the variations in appraising the value of a building. The study resulted in a controlling method which optimizes the change of the value of a building against the total renovation costs. This method should be further developed to take into account also the changes in the maintenance costs of the building caused by the renovation project.

36620 **(VTT-TUTK—484) Computerization of building standards.** Kaehkoenen, K.; Bjoerk, B-C. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Jun 1987. 111p. NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752872/JAW.

The number, scope and degree of detail of building regulations and standards has increased greatly over the last 20 years. Thus, designers today encounter difficulties in coping with this mass of information and its frequent updates. The authorities enforcing building regulations are also facing difficulties, due to the problems in checking designs created with the aid of a diverse selection of software. It seems that information technology may provide useful tools towards solving these problems. For example, special software tools can be used for writing regulations and standards which contain less contradictions and which are easier to understand and implement. Furthermore, software can be developed to help designers check that the designs they have created either manually or using CAD-systems are in accordance with the regulations. The publication is concerned with both the theoretical foundations and the software tools for computerizing building regulations. Previous research, especially from the United States Australia and the United Kingdom, is also briefly reviewed. The second part of the presentation describes a number of prototype systems developed at the Technical Research Centre of Finland. These include an expert system for fire regulations running in a question and answer mode and an augmented expert system which contains descriptive pictures illustrating the implementation of regulations. Next an example of integration of an energy calculation program with a CAD-system is described. Finally, current work related to the use of optical video discs as storage and presentation media for computer-controlled regulations data is briefly presented. As a conclusion, some propositions are given concerning research and development work in the computer aided creation and use of building standards.

36621 **Triple effect absorption chiller utilizing two refrigeration circuits.** De Vault, R.C. (to Dept. of Energy, Washington, DC). US Patent 4,732,008. 22 Mar 1988. Filed date 24 Nov 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A heat absorption method for an absorption chiller is described comprising: (a) providing a first absorption system circuit for operation within a first temperature range; (b) providing a second absorption system circuit for operation within a second temperature range which has a lower maximum temperature than the first temperature range; (c) heat exchanging refrigerant and absorber solution from the first circuit condenser and absorber with absorption solution from the generator of the second circuit; and (d) the evaporator of the first circuit and the evaporator of the second circuit both being disposed in thermal communication with an external heat load to withdraw heat from the heat load.

36622 **Saving electricity in commercial buildings with adjustable speed drives.** Eto, J.H.; De Almeida, A. (Lawrence Berkeley Lab., Berkeley, CA (US)). pp 91-95 of Industrial and commercial power systems technical conference (Conference Record). Piscataway, NJ; IEEE Service Center (1987). (CONF-870509—).

From IEEE/IAS industrial and commercial power systems conference; Nashville, TN, USA (4 May 1987).

This paper describes fan and chiller energy savings achievable in commercial buildings with adjustable-speed drives. The savings are estimated with the aid of parametric simulations from a sophisticated, hourly building energy simulation model. Two prototypes - a single-zone, retail store, and a multi-zone, medium office building - are simulated for five U.S. locations. The model incorporates part-load performance curves for both inlet vane and adjustable-speed drive controls for fans and centrifugal chillers. The results identify economic conditions that justify the added expense of adjustable-speed drives.

36623 **Development requirements for advanced industrial heat pumps.** Chappell, R.N.; Priebe, S.J. (U.S. Dept. of Energy, Idaho Operations Office, Idaho Falls, ID (US)). pp 2049-2055 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—). Contract AC07-76ID01570.

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879440.

State-of-the-art industrial heat pumps have the potential to offer significant energy savings in industrial processes, if they are appropriately integrated into the process energy network. Advanced heat pumps have the potential to offer even greater energy savings in many processes. The most important development requirements for advanced heat pumps are greater temperature lift and shorter payback times, which can be accomplished through a combination of improved performance and lower capital cost. To determine the characteristics needed for improved performance, a heat pump must be viewed not in isolation, but in terms of the total process. This requires a knowledge of both the energy flow through the process, and the nature of the appropriate process streams.

36624 **Evaluation of power control methods for free-piston Stirling engine driven heat pumps.** Griffin, F.P.; Domingo, N.; Chen, F.C. (Oak Ridge National Lab., Oak Ridge, TN (US)). pp 1875-1879 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—). Contract AC05-84OR21400.

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879412.

Aside from the problems of starting, a free-piston Stirling engine (FPSE) driven heat pump will tend either to stall or to overstroke if the FPSE power output is not controlled or matched to the compressor power requirement. Ambient temperature variations can create large changes in the power required to compress the refrigerant. An analysis was performed to investigate power control options for FPSE heat pumps. Six different FPSE power control methods were analyzed to determine their effect on the thermal performance of a heat pump system. The six control options are: 1) a displacer gas spring average volume control, 2) a displacer gas spring damping valve control, 3) a displacer alternator control, 4) an engine average pressure control, 5) an engine compression space average volume control, and 6) a compressor clearance volume control. Predicted engine efficiencies were best for control operations 4 and 6, and worst for options 2 and 3. The heat pump heating and cooling capacities were most nearly optimum for option 3, and worst for option 4.

36625 **Assessment of radioisotope heaters for remote terrestrial applications.** Uherka, K.L. (Argonne National Lab., Argonne, IL (US)). pp 1617-1622 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—).

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879341.

This paper examines the feasibility of using radioisotope by-products for special heating applications at remote sites in Alaska and other cold regions. The investigation included assessment of candidate radioisotope materials for heater applications, identification of the most promising cold-region applications, evaluation of key technical issues and implementation constraints, and development of conceptual heater designs for candidate applications. Strontium-90 (Sr-90) was selected as the most viable fuel for radioisotopic heaters used in terrestrial applications. Opportunities for the application of radioisotropic heaters were determined through site visits to representative Alaskan installations. Candidate heater appli-

cations included water storage tanks, sludge digesters, sewage lagoons, water piping systems, well-head pumping stations, emergency shelters, and fuel storage tank deicers. Radioisotopic heaters for freeze-up protection of water storage tanks and for enhancement of biological waste treatment processes at remote sites were selected as the most promising applications.

36626 **Indoor air quality control techniques. Radon, formaldehyde, combustion products.** Fisk, W.J.; Spencer, R.K.; Grimsrud, D.T.; Offermann, F.J. Park Ridge, NJ; Noyes Publications (1987). 245p. Noyes Publications, Mill Road at Grand Ave., Park Ridge, NJ 07656.

This book reviews and evaluates existing indoor air quality control techniques. The indoor air pollutants of most concern are radon, formaldehyde, and certain combustion products-nitrogen dioxide, carbon monoxide, carbon dioxide, and various respirable particles. Many techniques exist to control the concentration of these pollutants and other indoor pollutants that are only now being recognized as significant. The purpose of the book is to provide a current review and evaluation of these control techniques.

36627 **Photometric measurements in atria using the luminance mapper.** Balcomb, J.D.; Weaver, N. (Solar Energy Research Institute, 1617 Cole Blvd., Golden, CO (US)). pp 182-187 of Proceedings of the 12th passive solar conference. Andrejko, D.A.; Hayes, J. Boulder, CO; American Solar Energy Society (1987). (CONF-870711—).

From Solar '87: 12th national passive solar conference; Portland, OR, USA (12 Jul 1987).

Preliminary data are presented based on measurements using the luminance mapper in an atrium in Denver, Colorado. This photometric instrument is a digital video scanning system that records luminance values from the image plane of a fish-eye lens. Analysis of these data reveals that the predominant source of illumination on the atrium floor is from the diffuse sky; however, 20.3% is from non-glazed enclosing surfaces, clearly indicating that interreflections make an important contribution. Consistency of the data suggests that some improvements in experimental technique are desired; however, the value of the luminance mapper as a photometric tool is clearly demonstrated.

36628 **Recent improvements and sensitivity of the VISION glazing system thermal analysis program.** Sullivan, H.F.; Wright, J.L. (Advanced Glazing System Lab., Dept. of Mechanical Engineering, Univ. of Waterloo, Waterloo, Ontario (CA)). pp 145-149 of Proceedings of the 12th passive solar conference. Andrejko, D.A.; Hayes, J. Boulder, CO; American Solar Energy Society (1987). (CONF-870711—).

From Solar '87: 12th national passive solar conference; Portland, OR, USA (12 Jul 1987).

VISION is a computer program that was designed to perform a two band (solar and thermal) one dimensional analysis of a wide variety of glazing systems. Specifically, it is capable of calculating U-values and shading coefficients for ASHRAE winter and summer design conditions plus user specified design conditions. An hour-by-hour energy analysis is optional. Recent modifications to VISION are described. These modifications include a revised method for calculating U-value and shading coefficient, user specified design conditions, graphic output and an input library for optical properties of various glazings. Simulation results detail the sensitivity of glazing system U-value with respect to variations in imposed environmental conditions. Environmental conditions examined include temperature level, indoor/outdoor temperature difference, solar radiation intensity and fraction cloud cover.

36629 **(AD-A—190262/6/XAB) Hot in-place recycling of asphalt pavements. Master's thesis.** Dowdy, M.L. (Texas A and M Univ., College Station (USA)). 4 Aug 1987. 110p. NTIS, PC A06/MF A01.

The purpose of this report is to identify factors to consider in selecting a hot in-place recycling project for asphalt pavements. This report discusses the different types of recycling processes and several selected hot in-place recycling processes that are becoming so popular today. The types of asphalt pavement distress and their causes are discussed to provide a working knowledge of possible applications for this process. Discussions on project selection, design, and construction considerations will also provide an awareness of considerations relative to this type of asphalt-pavement rehabilitation. An understanding of these topics will be helpful when selecting hot in-place recycling. The information that this report is based upon was obtained from various sources. A literature search included technical reports, periodicals, and advertisements. Personal contact was made in the form of interviews with a number of representatives in the industry and on site inspection of Cutler Repaving, Inc. and Remixer Contracting Co., Inc. operations.

36630 **(CONF-880139—4) An efficient computational tool for ramjet combustor research.** Vanka, S.P.; Krazinski, J.L.; Nejad, A.S. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 14p. (AIAA—88-0060). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010034/JAW.

From 26. AIAA aerospace conference; Reno, NV, USA (10 Jan 1988).

A multigrid based calculation procedure is presented for the efficient solution of the time-averaged equations of a turbulent elliptic reacting flow. The equations are solved on a non-orthogonal curvilinear coordinate system. The physical models currently incorporated are a two equation k-ε turbulence model, a four-step chemical kinetics mechanism, and a Lagrangian particle tracking procedure applicable for dilute sprays. Demonstration calculations are presented to illustrate the performance of the calculation procedure for a ramjet dump combustor configuration. 21 refs., 9 figs., 2 tabs.

36631 **(CONF-880180—1) An overview of problems to be resolved when meeting the 1991 bus particulate emissions standard.** Santini, D.J.; Schiavone, J.J. (Argonne National Lab., IL (USA); American Public Transit Association, Washington, DC). 1988. Contract W-31109-ENG-38. 37p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010088/JAW.

From 67. annual transportation research board meeting; Washington, DC, USA (11 Jan 1988).

An overview of the engine-fuel-technology-transition problems that may be created for transit systems if the strict 1991 bus particulate and nitrogen oxides emissions standards remain in force is presented. The estimates of costs and benefits of the two standards combined are called into question. The problems created for manufacturers by the particulates–nitrogen oxides trade-off and the tight technology development schedule are reviewed. By introducing the perspective that emissions from transit buses should be thought of in terms of emissions per passenger mile, the 1991 treatment of buses with respect to nitrogen oxides emissions is called into question. The unique spatial relationships among buses, downtown pedestrians, and metropolitan places of residence are taken into account when evaluating the differing effects of nitrogen oxides and particulates bus emissions. Based on this examination, the strict 1991 particulate emission standards are accepted as desirable, but it is asserted that very little reason has been demonstrated to support the strict 1991 nitrogen oxides standards for buses. 36 refs.

36632 **(CONF-880676—1) Development of encapsulated lithium hydride sink-side thermal energy storage for pulsed space power systems.** Morris, D.G.; Foote, J.P.; Olszewski, M.; Whittaker, J.W. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 41p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011496/JAW.

From Conference on thermophysics, plasma physics and lasers; San Antonio, TX, USA (27 Jun 1988).

Value analysis indicates that inclusion of thermal energy storage (TES) as an element in a pulsed space power supply will reduce the mass of the heat rejection system. A candidate design for the TES component utilizes lithium hydride (LiH) encapsulated in 304L stainless steel or molybdenum in a packed-bed configuration with a lithium or sodium-potassium (NaK) heat transport fluid. Critical concerns with this concept are the need to (1) accommo-

date shell stresses induced by volumetric expansion of the melting salt or surface gripping by the freezing salt and (2) minimize hydrogen loss through the shell due to LiH dissociation at high temperatures. Experimental observation of significant cracking of the LiH during cooling mitigates the first of these issues by providing a leakage path into the interior void as melting occurs at the salt-containment interface, thus allowing use of thin shells.

36633 (CTH-IVB—43) Energy consumption for vehicles and road authorities in densely populated areas. Influence from operation- and street standard . Wallman, C.G. (Chalmers Univ. of Technology, Goeteborg (Sweden). Dept. of Highway Engineering). Apr 1986. 87p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752908/JAW.

The project consists of two parts. The first one explains the energy consumption of road users and road authorities due to maintenance standard and road standard. The work is mainly concentrated on determining how the pavement surface, wet, snowy or icy surface, and the road geometry influence on the driver's behaviour and the vehicle fuel consumption. The second part comprises construction of a computer-based system for computing road user consequences. Effects on the traffic of different maintenance measures can thus be computed.

36634 (CU—ERG763) Comparison of primary energy requirements for the operation of electric and conventional automobiles. Swinton, M.C. (Carleton Univ., Ottawa, Ontario (Canada)). Jun 1976. 44p. (CE—01483). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

As a part of the overall assessment of the potential role of electric automobiles in Canada, a study of the propulsive energy requirements of such vehicles has been undertaken. This entails a comparison of electric and conventional automobiles with respect to the energies required to produce a set amount of transportation work. The major processes are mining, refining, power generation, transmission or fuel transport, and vehicle operation. The energy conversion efficiencies that are characteristic of the energy supply industries, energy transportation, and vehicle operation of the electric and gasoline automobiles are estimated within the Canadian context. This allows a comparison of primary and secondary energy requirements of these vehicles for equal transportation tasks. The period of interest for this study is from 1980 to 2000. The system efficiency of the electric vehicle for urban travel is estimated to be 14% in 1980 decreasing to 12% in 1990 due to the decrease in electric power production efficiency. This may be compared to an estimated 7% system efficiency of an average Canadian automobile for urban travel. For highway travel, the corresponding figure is 23% in the 1980s compared to the conventional automobile's 13%. The vehicle system efficiencies were also examined for the province of Ontario in 1980. The operating efficiencies of 9.7% for the electric vehicle may be compared to 7% for the conventional automobile in urban travel. For highway travel, system efficiencies of 17% and 13% were obtained for the electric and gasoline vehicles respectively. 29 refs., 10 figs., 14 tabs.

36635 (DOE/TER—88/1) Transporation Energy Research: A current awareness bulletin. Smith, L.; Steele, B.C. (eds.). (USDOE Office of Scientific and Technical Information, Oak Ridge, TN). Jan 1988. 53p. (PB—88-900901). NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88008293/JAW.

Transportation Energy Research (TER) announces on a monthly basis the current worldwide information available on the engineering and design of energy-efficient advanced automotive propulsion systems and all aspects of energy conservation measures involving transportation.

36636 (HMC—031982) Energy conservation research and development opportunities in traffic operations. (Hickling (James F.) Management Consultants Ltd., Ottawa, Ontario (Canada)). Mar 1982. 29p. (CE—01499). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This study has been commissioned in an attempt to direct future activities in energy conservation research in the area of traffic operations. The stated objective of the study was to review recent and on-going research to determine the potential for conserving energy through improved traffic operations measures and to identify and recommend future research needs and potential payoffs from the implementation of research findings. In order to achieve this objective, a review was undertaken of current conservation techniques and North American research in progress. A seminar was held attended by a group of traffic operations researchers, practitioners and administrators. In developing strategies for fuel conservation, there are basically two actions that can be taken. The first attempts to increase the fuel efficiency of the vehicles using the road system while the second strategy attempts to alter the demand for vehicle use (or shift demand to more fuel efficient modes). It was felt that the most important areas to be researched with respect to fuel conservation through traffic operations were technology transfer, development of uniform standards for field trial evaluation, sensitivity analysis of various conservation measures, demonstration and evaluation of conservation techniques, development of traffic control systems and hardware, research on providing route information to drivers, and development of signal timing strategies. 6 figs., 3 tabs.

36637 (ISL/CR—4353) Fuel consumption guide quantitative evaluation: methodological report. (International Surveys Ltd., Toronto, Ontario (Canada). Customer Research Div.). Jul 1983. vp. (CE—01425). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This report presents only the methodological details of the quantitative phase of the evaluation of the 1983 Fuel Consumption Guide conducted on behalf of Transport Canada. The Guide is available from Transport Canada and the study was conducted among car drivers who had requested it. Two hundred completed interviews with people who had read the Guide were sought in each of six regions of the country. Selection details and a contact record are presented for eastern and western Canada. Sample questionnaires in English and French are included in the appendix. 4 tabs.

36638 (ORNL/CON—244) Technology transfer for DOE's Office of Transportation Systems: Assessment and strategies. Snell, S.A.; Brown, M.A.; Zerega, A.M. (Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OR21400. 105p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88010760/JAW.

This report reviews and assesses the technology transfer effort of the US DOE's Office of Transportation Systems (OTS) and offers recommendations for future technology transfer activities. The OTS technology transfer strategy calls for maximum industry involvement in both the identification and solution of R and D problems. This strategy is supported not only by utilizing industry as the research contractor, but also through a variety of other technology transfer activities. After reviewing the technical accomplishments of the Office, the report describes some of the barriers that inhibit commercialization of these accomplishments. Primary, secondary, and spin-off audiences for OTS R and D are then characterized. An inventory of recent OTS technology transfer activities follows and is supplemented by nine detailed case studies of technology transfer. These case studies represent five distinct approaches to technology transfer and a wide array of mechanisms including: contracting to industry, licensing, demonstration projects, user facilities, and financial incentives. The report ends with a list of recommended future technology transfer activities.

36639 (VTT-TIED—670) Speeds of company cars. Alppivuori, K. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Jun 1987. 66p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753354/JAW.

The speed of passenger cars driving outside queues within different speed limit zones as well as how the ownership of the car influences the driving speed were investigated. There were considerable differences in the speeds between the different car models.

Within the speed limit zones of 100 and 120 km/h medium-sized and large cars drive faster than the small ones. Within the speed limit zones 50 and 80 km/h this could not be observed. The age of the car influences the driving speed with 0.8-1 km/h per year within the speed limit zones 100 km/h and 120 km/h. Thus a five years old car, which corresponds to the middleage of our car park, drives 4-5 km/h slower than new cars. The influence of age could no be observed within the other speed limit zones. Company cars are an average 2-3 years younger than cars in private ownership. When the age correction was taken into consideration, it could be stated that the speed of company cars exceeded with 4 km/h that of the private cars within the speed limit zone 100 km/h. This difference could not observed within lower speed limit zones.

This book contains the manuscripts of the papers presented at the conference on 'Better utilization of raw materials and energy in the textile industry' as handed in by the authors. 3 papers are indexed separately in the database.

36642 (CONF-8603244—, pp 151-164) Heat recovery possibilities in air-nozzle looms. Schmidt-Burr, P. (PSB-Consulting G.m.b.H., Muenchen (Germany, F.R.)). Mar 1986. (In German). NTIS (US Sales Only), PC A10. Order Number DE88770211/JAW.

From VDI-ADT annual meeting on better utilization of raw materials and energy in the textile industry; Reutlingen, F.R. Germany (14 Mar 1986).

Compressed air is certainly the best transport and guidance medium for the weft yarn. Up to 600 weft yarns over 3 m weaving breath are possible. The fact that no maintenance is necessary is the most outstanding advantage in comparison to conventional mechanic gripper shuttle looms. The major part of the drive energy needed, i.e. 60-65% is needed for providing the compressed air for the air-nozzle loom. The higher demand of driving energy, i.e. 25 to 50% more than that of a gripper shuttle loom is made up for by an increased weaving output which, as a rule, is higher than the additional energy demand. The fact that most of the driving energy is needed by the air compressor has the additional advantage of permitting easy utilization of the waste heat.

36643 (CONF-8603244—, pp 181-189) Possibilities of energy saving by modern speed regulating AC motors. Waldinger, H. (Siemens A.G., Erlangen (Germany, F.R.)). Mar 1986. (In German). NTIS (US Sales Only), PC A10. Order Number DE88770211/JAW.

From VDI-ADT annual meeting on better utilization of raw materials and energy in the textile industry; Reutlingen, F.R. Germany (14 Mar 1986).

Static-converter fed, r.p.m.-controllable drives can help to save energy in many areas of the textile industry. Different types of drives (SIMOREG and SIMOVERT) are available. The profitability of such an investment can be easily determined once the operational data of the working process are known.

36644 (DOE/BP/71980—T1) Calibration of irrigation flow meters. Trimmer, W.L. (Oregon State Univ., Corvallis (USA). Dept. of Agricultural Engineering). Feb 1988. Contract AI79-86BP71980. 50p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010992/JAW.

Several meters working on the Doppler principle were tested. The Doppler meters depend on reflections from particles or bubbles in the fluid to measure velocity. Although they were linear, they were too inaccurate and inconsistent. Two meters working on the transit time principle were tested and worked very well. These meters measure upstream and downstream transit times for signal reflections from the inner pipe surfaces. However this type of meter is available at present only for permanent installations, not as a survey meter. Finally, the currently used Hall meters were calibrated and recommendations were made as to their proper use. The report recommends that an effort be made to develop a transit time meter in a portable configuration for irrigation survey work. 14 figs., 5 tabs.

36645 (DOE/CE/40699—T8) Energy conserved and costs saved by small and medium-size manufacturers: [Final and annual report], 1985-86 EADC [Energy Analysis and Diagnostic Center] program period. Kirsch, F.W. (University City Science Center, Philadelphia, PA (USA)). Mar 1988. Contract FC01-84CE40699. 41p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008815/JAW.

The Energy Analysis and Diagnostic Center (EADC) program continues to provide energy-conserving and cost-saving assistance in the plants of small and medium-size manufacturers. This report presents the results of energy audits in 300 such plants carried out by ten EADCs during the 1985-1986 program period. Also included are the results obtained during 1987 from manufacturers who implemented 1,267 of the EADCs' recommendations from the preceding year.

36646 (DTH-LET-RE—87-5) Ground water-source heat pumps. Partial report 6. Utilization of ground water as heat source for heat pumps. Niemi Soerensen, S.; Qvale, B. (Danmarks Tekniske Hojskole, Lyngby. Lab. for Energiteknik). Oct 1987. 103p. (In Danish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752909/JAW.

This report is worked out on the basis of experiences obtained from 189 Danish groundwater heat pump plants in the period 1982-1985. The experiences are collected through a questionnaire within the research programme of the Danish Ministry of Energy (EFP82). Besides the experiences obtained by the questionnaire the recent experiences from a groundwater heat pump test plant at the Technical University of Denmark are included in the report. The report gives a review of experiences with 189 Danish groundwater heat pump plants, recommendations for instrumentation of plants and recommendations for the establishment of the groundwater circulation system. These recommendations aim to avoid the difficulties experienced with this type of heat pump plants. Furthermore the report gives some recommendations for the instrumentation of plants for managerial economics and supervision. Finally guidelines are given for calculations of the thermal load on aquifers used as heat source for heat pumps. These guidelines can at present only be stated as preliminary because of lack of field experience.

36647 (EGG—2539) A comparative economic evaluation of industrial heat pumps: Part 2, Addendum to report EGG-2408. Bliem, C.J. (EG and G Idaho, Inc., Idaho Falls (USA)). Jun 1988. Contract AC07-76ID01570. 98p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88011701/JAW.

This report extends the findings of a study on the cost of delivering process heat with state-of-the-art heat pump systems originally reported in EGG-2408. The original report considered heat pump of a 30 MM Btu/h size, receiving heat from a waste-heat source at 220{degree}. This report extends the work to a 10 MM

Btu/h size and to waste-heat sources at 180{degree} and 320{degree}F. Results of the original study are being used to define economic performance which must be met or improved upon by advanced heat pump concepts in order to warrant Department of Energy (DOE) development support. This work will extend the range of applicability to other sizes and waste-heat source temperatures. Sixteen heat pumps systems were configured for relative cost comparisons for each waste-heat source and size. These systems consisted of electrically-driven, prime energy-driven, and waste energy-driven reverse Rankine cycle heat pumps of the open, semiopen, and closed type. In addition, a waste energy-driven absorption heat pump was analyzed. A conceptual design of each system was created using the off-the shelf components generally available to engineering firms. The performance of each system was assessed, the major components sized, and the installed cost determined. Maintenance costs were estimated. Finally, the relative cost of energy delivered by each system was estimated, and the cost of delivery heat with state-of-the-art heat pumps was determined.

36648 **(GAO/NSIAD—87-88BR) Hazardous waste: Abandoned disposal sites may be affecting Guam's water supply.** (General Accounting Office, Washington, DC (USA)). 1987. 20p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

In 1978 Anderson Air Force Base in Guam discovered that the base's drinking water was contaminated with the cleaning solvent trichloroethylene, a suspected carcinogen. The sources of the contamination were old, abandoned landfills where the solvents had been disposed. Testing of the drinking water has been sporadic and has not included water consumed by portions of the installation populace. Anderson officials established procedures to test water samples monthly at different points in the water distribution system and if the test results indicate contamination, corrective action will be taken to make the drinking water safe, or the wells will be shut down.

36649 **(GAO/NSIAD—87-164BR) Hazardous waste: Tinker Air Force Base is making progress in cleaning up abandoned sites.** (General Accounting Office, Washington, DC (USA)). 1987. 23p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

Tinker Air Force Base in Oklahoma is a major generator of hazardous waste. Problems with the generation, storage, and disposal of the waste have resulted in the contamination of several sites on base. To clean up the contamination, Tinker established an Environmental Action Group to increase its responsiveness to hazardous waste issues and to act as a clearinghouse for all environmental actions. It also established a single point of contact for environmental issues by creating a new Environmental Management Directorate; created a Technical Working Group to establish agenda items concerning its Installation Restoration Program, such as possible cleanup alternatives; and contracted with the Army Corps of Engineers for completing the Installation Restoration Program on a cost-reimbursement basis. However, remedial actions are slow and much needs to be done.

36650 **(GAO/NSIAD—87-200BR) Hazardous waste: Siting of storage facility at Kelly Air Force Base, Texas.** (General Accounting Office, Washington, DC (USA)). 1987. 10p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

This report provides information on whether the hazardous waste storage facility at Kelly Air Force Base meets Resource Conservation and Recovery Act, state, and Air Force siting requirements; on whether the Air Force or the Defense Reutilization and Marketing Office selected the best site available to protect the public and to preserve good public relations with the community; on whether the Air Force, Kelly Air Force Base, or the Defense Logistics Agency adjusted siting standards as a result of the adverse publicity the hazardous waste facility has generated; and on whether Kelly Air Force Base is revising its hazardous waste management organization so that it is similar to the organizations at Tinker and McClellan Air Force Bases.

36651 **(GAO/RCED—87-127) Toxic substances: Abandonment of PCBs demonstrates need for program improvements.** (General Accounting Office, Washington, DC (USA)). 1987. 33p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

In April 1985, SED, Inc, a PCB handling and disposal company, went out of business, abandoning approximately 7 million pounds of the highly toxic materials and equipment at its sites in Greensboro, North Carolina, and Hillsboro, Ohio. The Environmental Protection Agency did not act to prevent SED from continuing to acquire large amounts of PCB materials while it only disposed of a small portion and EPA inspections of SED operations were not frequent or forceful.

36652 **(GAO/RCED—87-132FS) Hazardous waste: Information on EPA's proposal to delete chemicals from groundwater monitoring.** (General Accounting Office, Washington, DC (USA)). 1987. 20p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

Information is not readily available on the quantities of hazardous waste being disposed of that contain 42 toxic chemicals. Twenty-nine of the 42 chemicals are highly toxic and over one third might possibly be found at hazardous waste land disposal facilities. In some instances, short-term exposure to the 29 chemicals in pure form could lead to death or permanent injury. In addition to toxicity, some of the chemicals are known or are suspected of having other harmful effects on humans or animals. Owners/operators of hazardous waste land disposal facilities are required to initially monitor the characteristics of groundwater for detection of contamination. Despite this requirement, the Environmental Protection Agency proposed deleting the 42 chemicals from testing - a proposal which elicited queries from two congressional committees. So far, EPA's final regulations on the proposal have not yet been issued.

36653 **(GAO/RCED—87-156FS) Water quality: Pollution of San Francisco Bay and the Sacramento-San Joaquin Delta.** (General Accounting Office, Washington, DC (USA)). 1987. 36p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

Pollution in the San Francisco Bay and the Sacramento-San Joaquin Delta is a problem but the full extent of the problem and its impact on the overall health of the bay is not fully known. GAO found that federal wastewater dischargers contribute less than 1 percent of the total wastewater directly discharged in the bay and delta. Hazardous waste leaks from federal facilities have significantly less effect on overall water quality compared with other sources of bay and delta pollution. Federal studies are underway to better identify and quantify bay and delta pollution sources and to set priorities among pollution problems and develop a plan to enhance the bay's and delta's environmental health.

36654 **(IVO-A—08/87) Potential uses of infrared heating and drying in the mechanical wood processing industry.** Kautto, J.; Tarvainen, V. (Imatran Voima Oy, Helsinki (Finland)). 1987. 83p. (In Finnish). NTIS (US Sales Only), PC A05. Order Number DE88752816/JAW.

The report deals with the theory and applications of infrared (IR) heating and drying processes in the mechanical wood processing industry. In the mechanical wood processing industry, IR drying is mainly used for the drying and hardening of surface finishing agents, such as varnishes and paints and for the preheating of surfaces. In the gluing of various coatings, IR technique is used for pre-evaporation of the glue and for the heating of base board. Other applications include pre-evaporation and activation of the edging strip glue, preheating of the laminate before bending in post-forming and pre-evaporation of the glue in the scarf-jointing of veneer sheets. IR technique can also be applied to increase the production capacity economically, for instance pre- or redrying in the of veneer. The wood industry uses short-wave, medium-wave and long-wave IR radiation in its applications; medium-wave infrared is most commonly used. Medium-wave IR radiation is well absorbed in wood, water and surface finishing agents to be used. The heating effect of medium-wave IR radiators is suitable for several purposes in the wood industry; medium-wave IR ovens warm up and cool

down rapidly compared with convection dryers. Short-wave IR radiation is suitable for surface finishing agents allowins rapid drying and requiring high amount of energy, such as water-based paints and for applications requiring high penetration of the radiation into the material to be heated. Long-wave IR radiation has only few uses and it is often economical to replace long-wave IR lines by medium-wave IR lines. In IR drying the tendency is to adopt more and more efficient IR equipments. The use of infrared will continue to increase; however, it is difficult to evaluate the potential for development, because on the market IR technique competes with vertical dryers and with ultraviolet equipments.

36655 (NEI-DK—63) Reducing electricity consumption in American type combined refrigerator/freezer. Pedersen, P.H.; Schjaer-Jacobsen, J.; Norgard, J.S. (Danmarks Tekniske Hoejskole, Lyngby. Fysisk Lab. 3). May 1986. 14p. (CONF-8605334—2). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752836/JAW.

From 37. annual international appliance technical conference; Lafayette, IN, USA (6 May 1986).

At the Technical University of Denmark work was started early in 1985 with the purpose of reducing energy consumption of American style 20 cubic feet combined refrigerator/freezers. The work is sponsored by two California utilities. The goal is to reduce energy consumption to 480 kWh/year or one half of what best 1984-models use while maintaining automatic defrosting and other services. Outer dimensions remain the same, but the inner volume is allowed to be reduced to 18 cubic feet. Some prototypes are being built by employing European principles with separate refrigerator and freezer circuits (two-compressor system). A special fresh food evaporator with additional heat capacity is used together with an integrated condenser placed at the inner side of the outer cabinet. The latter reduces condenser temperatures and furthermore saves electricity for the antisweat heaters. Insulation thickness is slightly increased and other improvements are implemented. The separation of the two refrigeration systems considerably reduces the frost build-up on the freezer evaporator and thereby the need for electricity consuming defrosting. The fresh food evaporator is defrosted automatically without consuming electricity. Calculations show that it is possible to reduce the electricity consumption to approximately 480 kWh/year.

36656 (PB—88-184890/XAB) Industrial boiler furnace sorbent-injection algorithm development. Final report. Maddox, J. (Radian Corp., Research Triangle Park, NC (USA)). Mar 1988. 52p. NTIS, PC A04/MF A01.

This report describes the development of a performance and control-cost algorithm for the Industrial Combustion Emissions (ICE) Model, one of four stationary source emission and control cost forecasting models developed by EPA for the National Acid Precipitation Assessment Program (NAPAP). The ICE Model projects air pollution emissions (sulfur dioxide (SO_2), sulfates, nitrogen oxides, and particulate matter), cost, and fuel mix for industrial fossil-fuel-fired (natural gas, distillate and residual fuel oil, and coal) boilers by state and year (1980 baseline, 1985, 1990, 1995, 2000, 2010, 2020, and 2030). The algorithm enables the ICE Model to consider, on an economic basis, the use of hydrated lime injection for SO_2 control when a SO_2 emission reduction strategy is implemented. The algorithms described have been incorporated into ICE Model Version 6.0.

36657 (PB—88-197579/XAB) Resource recovery and waste reduction: fourth report to Congress. (Environmental Protection Agency, Washington, DC (USA). Office of Solid Waste). Aug 1977. 162p. (EPA—530/SW-600). NTIS, PC A08/MF A01.

See also PB—88-174677.

The report reviews current status of resource recovery and waste reduction in the United States and presents new findings from Environmental Protection Agency (EPA) studies, investigations, and technology demonstration projects.

36658 (STEV-FVE—87-6) Heat pumps in Industry. Operating experiences from 12 plants. Bergstroem, U.; Larsson, R. (Statens Energiverk, Stockholm (Sweden)). May 1987. 86p. (In Swedish). NTIS (US Sales Only), PC A05. Order Number DE88752959/JAW.

This report describes twelve industrial sites where heat pumps are used to recover waste heat from the process. Operating experience has generally been favourable. The most serious problem has been high frequency of motor faults. Control problems have been encountered in some of the installations, often due to attempts to control both the evaporator and the condenser side of the heat pumps. Most of the users had specified and purchased the equipment themselves. In fact, this has been essential, as the heat pumps have had to be matched to relatively complex existing systems. The heat pumps have normally been installed to recover process heat that would otherwise have been discarded. With few exceptions, the heat has been used for space heating and domestic hot water production. Performance measurements made indicated that the heat pump systems have largely lived up to expectations in terms of performance and availability. In some cases, the quality of owners' own monitoring of performance was poor.

36659 (STEV-FVE—87-7) Power levelling of district heating systems. Johnsson, H. (Statens Energiverk, Stockholm (Sweden)). Mar 1987. 86p. (In Swedish). NTIS (US Sales Only), PC A05. Order Number DE88752960/JAW.

The aim of the project is to describe and compare different methods of power levelling and heat storage in district heating systems. Hot water cisterns are well known for storage. Different systems are described and evaluated. Operational statistics from district heating and users are reported. (G.B.).

36660 (STU—81-4593) Anaerobic treatment of CTMP effluent. Boman, B.; Almemark, M.; Bergstroem, R. (Swedish National Board for Technical Development, Stockholm; Swedish Environmental Research Inst., Stockholm). Jun 1986. 153p. (In Swedish). (STU—82-5792; IVL-B—830). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88752973/JAW.

Experiments with anaerobic treatment of a CTMP effluent in a contact reactor and in a submerged filter (one-stage processes) were carried out on a pilot-plant scale at the pulp and paper mill of Rockhammar. The treatment process was also tried with the two reactors connected in series. In addition, comparative experiments with laboratory filters were performed. The experiments on a pilot-plant scale gave a maximum COD reduction rate of 70%. The COD reduction rate of the anaerobic filter proved to be completely independent of the load within the interval studied (<or= 6 kg COD/m/sp3/,d), while the COD reduction rate of the contact reactor decreased linearly with increasing load. The COD reduction rate of a full-scale treatment plant will also depend on the effectivity of the sludge separation process necessarily following the anaerobic reactor. Sedimentation experiments indicated that the residual concentration of suspended solids will be around 900 mg SS/l. Since the suspended material contains about 2 kg COD/kg one may expect a full-scale plant to give a real COD reduction of about 58%. The experiments suggest, that there exists a linear correlation between the specific methane production rate and the load with a slight negative slope within the load interval studied (0.5-6.5 kg COD/sbtot//m/sp3/,d). In our case specific methane production rates within the interval 0.1-0.2 m/sp3/ CH/sb4/ COD were obtained (COD=CODtot,in - CODdissolved,out). On the basis of our results and experiences the most likely explanation for the relatively low methane yields seems to be some bactericidal organic compound(s) within the group of extractives. The sulphur-reducing bacteria are very sensitive to disturbances and toxicity. The experiments suggest, that these bacteria may serve as indicator organisms for the 'level of disturbance' in the reactor, and that the filter is less sensitive to disturbances than the contact reactor. (authors).

36661 (STU—83-3176) Optimum chemicals recovery system. A first report. Theliander, H. (Swedish National Board for Technical Development, Stockholm). Aug 1986. 180p. (In Swedish). NTIS (US Sales Only), PC A09/MF A01. Order Number DE88752975/JAW.

The chemical recovery system of a sulphate pulp mill is probably one of Sweden's largest inorganic processes with great technical and economic importance. The section that comprises the smelt from the recovery boiler to the white liquor produced is a part of the process on which relatively few research contributions

have been published. With the purpose of finding an energy optimal process solution for this section, a system analysis study has been carried out. Thereby it was found necessary, in order to elucidate the potential possibilities that different procedures would result in, both to study the present process technique and to simulate possible improvements. Within the frame of the present work special emphasis was attributed to the three following parts: system analysis studies of present processes, theoretical studies of different process procedures, and density of aquous solutions of salts An important conclusion of the present system analysis study, based on the evaluation of three different mill recovery systems, is that all the systems have a negative exergy effiency. This means that the mill recovery systems investigated ought to produce energy and not, as the case is today, consume energy. The theoretical studies showed that the energy efficiency could even be increased with a factor of about 2.5, compared with the mill recovery systems of today. The amount of energy that could thereby be saved in the sulphate pulping process is of the same order of magnitude as the energy consumed in the lime kiln.

36662 **(SVF—276) By-products from fluidized beds - characteristics with respect to disposability and re-use.** Nilsson, C. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Aug 1987. 119p. (In Swedish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88753348/JAW.

In this investigation, materials from four different fluidized bed plants, based on differing fundamental designs, have been dealt with. These include: -the atmospheric bubbling bed (pilot plant, 10 MW), -the circulating bed (district heating plant, 40 MW), -the pressurized bed (pilot plant, 12 MW), -the multi bed (pilot plant, 2 MW). In the investigations, important physical characteristics as well as chemical compositions including trace-metal content have been accounted for. Tests show that the leaching out of trace elements generally occurs slowly, probably due to the high alkalinity of the materials. The salts, as expected, leach out relatively quickly and certain materials contain traces of sulphite which contributes to an increased Chemical Oxygen Demand value in the leachate. The investigation shows that especially those materials which are not completely combusted possess poorer frost and physical characteristics, which is assumed to depend on the fact that the air bubbles needed to take up the swelling movements are not beeing admixed to the normal extent in these materials. Additionally, materials with a remarkably high content of free lime display impaired physical characteristics. The general consequence of this is that fly ash usually possesses a poorer strength than bed ash.

36663 **(VTT-TIED—791) Laser applications in the concrete industry and concrete construction.** Seren, K-J. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Nov 1987. 58p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753000/JAW.

The publication discusses on the basis of literature studies the possibilities of applying laser technology in the concrete industry and to concrete construction. The principles and general application areas of laser technology are briefly presented and examples of laser applications relating to concrete and concrete structures are given. The publication concludes with some ideas about potential applications in the concrete industry and various viewpoints concerning the needs for future research. The laser cutting method has been used experimentally to cut hardened concrete. The method however, is not at present economically viable in production. Laser measuring equipment can be used in the concrete industry, especially for dimensional measurements. In the near future, research should focus on an extensive survey of measurement requirements and possible measuring methods in the concrete industry.

36664 **System for conversion between the boundary representation model and a constructive solid geometry model of an object.** Christensen, N.C.; Emery, J.D.; Smith, M.L. (to Dept. of Energy, Washington, DC). US Patent 4,736,306. 5 Apr 1988. Filed date 29 Apr 1985. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A method of manufacturing an object from a boundary representation thereof is described comprising: cleaving the boundary representation of the object, which represents the object only by zero, one or two dimensional features thereof, into elemental atomic geometrical units; assembling the I-bodies into assemblies having atomic geometrical forms which collectively form a constructive solid geometry representation of the object usable for manufacturing thereof; utilizing the constructive solid geometry representation of the object to develop machine instructions for instruction one or more machines in a manufacturing process; and controlling the machines to perform operations under control of the instructions to manufacture at least a portion of the object.

36665 **(DOE-tr—88-10) Energy conservation.** (USDOE, Washington, DC). 1988. Translation source information not available. 61p. NTIS, PC A04/MF A01;3.

Various research programs of energy conservation and materials recovery are briefly described. Topics include food drying,electrolysis, incinerators, optimization of dewatering equipment, membrane technology, and separation processes. Many programs are discussed in these areas. (CBS)

36666 **Development of the remedial action priority system: An improved risk assessment tool for prioritizing hazardous and radioactive-mixed waste disposal sites.** Whelan, G.; Strenge, D.L.; Steelman, B.L.; Hawley, K.A. (Pacific Northwest Lab., Richland, WA (US)). pp 432-437 of Management of uncontrolled hazardous waste sites. Silver Spring, MD; Hazardous Materials Control Research Institute (1985). (CONF-8511122—). Contract AC06-76RL01830.

From 6. national conference on management of uncontrolled hazardous waste sites; Washington, DC, USA (4 Nov 1985).

The Remedial Action Priority System (RAPS) represents a methodology that prioritizes inactive hazardous and radioactive mixed-waste disposal sites in a scientific and objective manner based on limited site information. This methodology is intended to bridge the technology gap that exists between the initial site evaluation using the Hazard Ranking System (HRS) and the time-consuming process of actual field site characterization, assessment and remediation efforts. The HRS was designed as an initial screening tool to discriminate between hazardous waste sites that do not and those that are likely to power significant problems to human health, safety and/or the environment. The HRS is used by the U.S. EPA to identify sites for nomination to the National Priorities List (NPL). Because the HRS is not designed to evaluate sites containing radionuclides, a modified Hazard Ranking System (mHRS) addressing both hazardous and radioactive mixed wastes was developed by Pacific Northwest Laboratory (PNL) for the U.S. Department of Energy (DOE). Neither the HRS nor the mHRS was designed to prioritize sites that are nominated to the NPL according to their potential risks. To provide DOE with a better management tool for prioritizing funding and human resource allocations for further investigations and possible remediations at its inactive waste sites, PNL is developing the risk assessment methodology called RAPS. Use of RAPS will help DOE ensure that those sites posing the highest potential risk are addressed first.

36667 **(AS—EMR8) District heating for small communities.** (Acres Shawinigan Ltd., Toronto, Ontario (Canada)). Jan 1977. 115p. (CE—01491). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This study addresses the problem of providing district heating for smaller communities in Canada. In February, 1976 a report titled "District Heating Study", issued by the Ontario Ministry of Energy, addressed the problem of providing district heating for a town of 70,000 people and used the proposed new town of North Pickering as a model. The present study uses the same basic parameters and assumptions as the Pickering study but considers both new and existing communities of 20,000, 10,000 and 2,500 people respectively. A comparison is made between the costs of providing

heat by individual heating systems and the costs of district heating using central fossil fuel fired boilers. The study concludes that there is an economic case in favour of district heating for new communities as small as 2,300 people incorporating an industrial component or 4,500 people for purely residential communities. Retrofitting district heating to existing communities is considerably more expensive and a very high percentage of the potential heating load must be connected to the district heating system to make the scheme economically viable. 1 ref., 9 figs., 79 tabs.

36668 (AS—EMR10) Gas turbines and district heating. (Acres Shawinigan Ltd., Toronto, Ontario (Canada)). Feb 1977. vp. (CE—01492). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This study, commissioned by the Department of Energy, Mines and Resources, addresses the problem of utilizing gas turbines in conjuction with distict heating schemes. In February, 1976 a report titled "District Heating Study" was issued by the Ontario Ministry of Energy. That study addressed the problem of providing district heating from nuclear and/or fossil fuel sources for a town of 70,000 people and used the proposed town of North Pickering as a model. The present study uses the same model and considers the application of various combinations of gas turbine generators with heat recovery equipment and auxiliary boilers to provide the electrical and heat energy requirements of the model community. The study concludes that there is a technical and economic case for gas turbine based schemes providing both heat and electrical energy when compared with the separate supply of these two services. 37 refs., 33 figs., 38 tabs.

36669 (BFR-R—53-1986) Recovery of heat losses from district heating mains by heat pumps. Types of mains and system optimisation. Baerring, M.; Rosenberg, M. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 90p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752883/JAW.

The objective of this work has been to perform technical and economic optimisation of the design and siting of a ground collector intended for use with a heat pump to recover losses from district heating mains. Calculations indicate that such a scheme would be economically viable only if an existing heat pump was available and if the price of electricity was relatively low. (authors).

36670 (CONF-8805107—1) Potential of converting MSW [municipal solid waste] to useful fuels. Mallya, N.; Helt, J.E. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 11p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010040/JAW.

From 13. national waste processing conference and exhibit; Philadelphia, PA, USA (1 May 1988).

Pyrolysis of municipal solid waste (MSW) has the potential of helping solve two problems: (1) the disposal of the waste generated by our society, and (2) the need for additional sources of energy. Experiments on the pyrolysis of MSW components in a bench-scale reactor are reported. The liquid and solid products formed are analyzed for physical and chemical properties to help determine their potential as useful fuels.

36671 (DOE/CE/15294—T1) The ultra pure water system: Final report. Karlson, E.L. (Karlson (Eskil), Erie, PA (USA)). Mar 1988. Contract FG01-86CE15294. 19p. Eskil L. Karlson, Life Support Systems, Inc., 4634 State Street, Erie, PA 16509. Order Number TI88010812/JAW.

The design, building and the testing of an Ultra Pure Water Generation System that was funded by the Department of Energy (DOE) after first being evaluated by the National Bureau of Standards is covered. This system will accept water that is highly polluted with both suspended and dissolved solids. The purification and sterilization is performed in stages. As the water is pumped in, it is first forced through a set of three filters. These filters collect 99% of the particles. The water is then sent through the ion-exchange section which extracts 99.9% of the dissolved solids. The water is then sent through a mixed ion-exchange column and into the the last micro filter. It then is sent to a two gallon holding tank. While in the tank the pure water is polished with ozone gas. The flow through the complete purification system is 2 gallons per minute, therefore, its exposure time to ozone in this holdup tank is about 5 minutes. During the time any oxidizable matter, bacteria or viruses left will be destroyed. An important cycle of this unit is the back flush system. After each use of the water purification system, the unit reverses the flow of water through the larger particle filters.

36672 (DOE/CE/26550—T2) Feasibility study for district heating and cooling for the City of Des Moines, Iowa. (Des Moines Engineering Dept., IA (USA); Iowa State Univ. of Science and Technology, Ames (USA). Design Research Inst.). 1987. Contract FG01-86CE26550. 219p. NTIS, PC A10;3. Order Number DE88009087/JAW.

The Des Moines District Heating and Cooling Assessment Study shows that: District heating and cooling are technically feasible, with the Iowa Power Plant as a primary energy source with cogeneration and three types of distribution media: high and low temperature water for heating and chilled water for cooling. District heating is economically feasible, but additional studies are needed for cooling. In general, district cooling should be considered mainly in addition to heating, except perhaps for small systems. To be economically feasible, the large consumer/producers (Capitol Complex, Drake University, and the four hospitals) should be included, and a strong marketing effort conducted to induce a large portion of major downtown buildings to join the system. To help in marketing, piping connections and system conversions in the buildings or groups of buildings should be included in the overall construction project and its financing. Further consideration should be given to construct the metro refuse burning plant as an additional energy source for district heating and cooling, or to have this function take place at the Iowa Power Plant with fluidized-bed boilers. The large consumer/producers can reduce the peak load conditions and enjoy reduced interruptible rates. The Iowa Gas Company could be considered as an alternate energy source, with a downtown location for a DHC plant.

36673 (DOE/CE/63471—T6) A plan for Central Vermont Community Action Council to form a new energy/housing services unit. (Woodbury Organization for Research and Development (USA)). 30 Aug 1987. Contract FG01-86CE63471. 119p. NTIS, PC A06;3. Order Number DE88007578/JAW.

This plan for Central Vermont Community Action Council, Inc. (CVCAC) to form an Energy/Housing Services Unit (EHSU) will prepare it for the challenges that it must meet in the late 1980's and early 1990's if it is to properly serve the interests of the poor and disadvantaged in its 56 town operational area. Potential for-profit business areas for the EHSU to pursue were examined but always from the perspective of how they could benefit CVCAC and its clients and not as an end unto itself. With these criteria in mind, and taking into account current market forces, major business ventures into infra-red thermography, storm window manufacturing, and fee-for-service weatherization were found to be impractical for CVCAC to pursue at this time. It is the recommendation of this plan that fee-for-service weatherization of multi-family subsidized housing be pursued as well as a small-scale increase in storm window production with sales to private purchasers. This plan also recommends that CVCAC acquire the FHC family housing project.

36674 (DOE/EA—0079) Energy Conservation Grants Program for schools, hospitals, and public buildings: Environmental assessment. (USDOE Assistant Secretary for Conservation and Solar Applications, Washington, DC). Mar 1979. 36p. NTIS, PC A03. Order Number DE88008858/JAW.

This EA analyzes the environmental impacts of the grants program which was established by Title III of the National Energy Conservation Policy Act (NECPA) (PL 95 to 619).

36675 (HMA—EMR7) A study of the economic implications of optimal building insulation on district central heating systems. (Hedlin, Menzies and Associates Ltd. (Canada)). Apr 1976. 104p. (CE—01489). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

An economic and engineering study has been made of providing space heating to the proposed new Pickering (Ontario) Townsite testing both conventional, individual heating systems and centralized district heating systems, using heat from a nuclear power plant and also from non-nuclear sources. In this study the relative economics of individual and district heating sytems are examined under updated insulating standards that are considered more appropriate for the energy cost that exists in 1976. The basic conclusion drawn from the study is that the optimal insulation standards reduce overall demands for heat by over 40%. This results in a 5% increase in unit costs of heat because of lower density of demand but clearly the overall demand decrease more than offsets this cost change. The design load for the whole township is reduced by 41%; of this reduced load, 71% is accounted for by lowering the number of air changes and 29% by improved insulation. In capital items, the economics of district heating system improves relative to conventional, individual heating system under optimal conditions, given that the net incremental costs are only $4.29 million for the former but $39.03 million for the latter. The investment costs of distribution per dwelling unit for low and medium density housing is relatively insensitive to reduced densities of demand under optimal conditions. For high density housing, costs and demand changes seem to be directly related. 27 figs., 48 tabs.

36676 (JFM—EMR8) A study of the potential industrial use of district heating. (Malaren (James F.) Ltd. (Canada)). Dec 1976. 44p. (CE—01490). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This study was designed to obtain detailed information on the estimate of the industrial energy demand that might be satisfied by a district heating system. A stratified sample of industries in Winnipeg was surveyed in order to obtain an estimate of the quality of the energy used in its final form. From the information it was possible to obtain an overview of the potential for supplying that energy from a district heating system. The projected heat use density in a hypothetical new industrial area consisting of the study group of industries, if only obvious uses are considered, would likely be economically acceptable for a hot water or low pressure steam district heating system. If moderate limits are placed on the permitted ratio of vacant land to building gross floor area, and incentives or deterrants are offered to install energy systems adaptable to district heating, the projected district heating load would be increased to the point where such a district heating system would prove economically desirable. Although the district heat load could be increased further, this would not likely be cost-effective. In general, the results agree with the more general studies available for Canada and suggest that it would be economically feasible to provide at least half the energy used by the average manufacturer in this way. Although a high energy intensive industry was not included in the study, the location of one within the new industrial 'park' would have greatly improved the economic feasibility of an overall district heating system. The study, nevertheless, offers further evidence of the practicability of district heating in a Canadian environment. 14 refs., 3 figs., 9 tabs.

36677 (KTM/E-D—142) Using wood and peat fuels more effectively in district heating plants. Flyktman, M.; Mietinen, M.; Seppaenen, V.; Vesterinen, R. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). 1987. 112p. (In Finnish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752828/JAW.

The aim of this study was to develop the economy of operating in district heating plants using domestic fuels. The study was carried out by gathering information from 15 district heating plants using different techniques and fuels. Efficiencies and emissions were measured in 10 plants. Besides determination methods for fuel energy were analyzed. In boiler measurements can be found that it has been possible to reach efficiencies which are more than 87% in all forms of combustion. The best efficiency was measured in fluidized bed boiler. In grate combustion boilers the best efficiencies were also better than 90%. The efficiencies of one boiler using combustion of gasified fuels were 2-3 percent units lower than in other boilers. This is caused by the evaporation heat at the moisten water needed in the combustion method. In most boilers the best efficiencies were reached burning fuel whose moisture was lower than that of the fuel meant to burn. Dust emissions in district heating plants firing domestic fuels were smaller than 300 mg/MJ on average, which is the maximum for older plants (effect 5-10 MW). For a while the dust content in flue gases increased for example by sweeping the boiler, by shaking up the electric precitator and by disturbances in fuel feeding. The emissions of peat burned in grate combustion or in fluidized bed were nitrogen oxides 90-290 mg/MJ and in combustion of gasified sod peat they were 185-515 mg/MJ. Conversion between nitrogen in fuel and nitrogen oxides in flue gases was in grate combustion and in fluidized bed combustion less than 10% and in combustion of gasified fuel 8-22%, when peat was burned. The charge of the fuel energy based on heat production gives by present knowledge as good and economical accuracy to determine fuel energy as methods based on fuel quality.

36678 (KTM/E-D—146) Electricity consumption of services. Koski, P. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). Jan 1988. 113p. (In Finnish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88753327/JAW.

In 1984 electricity consumption of services was over 7 TWh, which is about 15% of the total electricity consumption in Finland valued at FIM 2000 million. Community services (generation and distribution of heat and electric energy, water supply) and road lighting represent about 20% of the annual electricity consumption of services. The most important is the consumption of service and public buildings. Stores, hotels and restaurants represent about 40% of electricity consumption of service and public buildings. About half of that is consumed in department stores and food stores. This is the same amount as the consumption in office buildings. When examining electric load of services and changes of that it was found out that the load of office and school buildings was about 49% of the total load of service and public buildings on winter workday mornings. That is much more than the annual energy consumption share of those buildings, which is 35%. The load of stores, hotels and restaurants was on winter workday mornings 29% respectively - in the evening the load was about 42% corresponding to the annual energy consumption. Consumption of electric energy in services is growing fast - especially the consumption of service buildings. Only part of that is due to the growing volume of service buildings and spaces. Consumption of old buildings also often increases year by year and new buildings often use more electric energy than the old ones - school buildings are a good example. The growing and more versatile usage of electrical devices is probably one of the most significant factors which increases the electricity consumption in services.

36679 (PB—88-185087/XAB) Handbook: identification and correction of typical design deficiencies at municipal wastewater treatment facilities. (Environmental Protection Agency, Cincinnati, OH (USA). Center for Environmental Research Information). Apr 1982. 422p. (EPA—625/6-82/007). NTIS, PC A18/MF A01.

This handbook has been prepared for use by engineers involved in the design and review of designs for publicly-owned treatment works (POTWs). Its intent is to identify design deficiencies found to limit the performance of POTWs. Design considerations were developed that will eliminate these deficiencies during the design phases of the project. The document will prove useful to personnel involved in the operation and maintenance of POTWs since procedures are presented, where feasible, for correction of design deficiencies at existing facilities. Use of the handbook will assure that the design incorporates a maximum number of operational conveniences.

36680 (PB—88-197561/XAB) Resource recovery plant implementation: guides for municipal officials, planning and overview. Shilepsky, A.; Lowe, R.A. (Environmental Protection Agency, Washington, DC (USA). Office of Solid Waste). 1976. 40p. (EPA—530/SW-533). NTIS, PC A03/MF A01.

Supersedes PB—259139.

This report replaces an earlier version entitled Resource Recovery Plant Implementation: Interim Report (SW-480) (PB-259139/4). The report will assist municipal offices in the planning and implementation of processing plants to recovery resources from mixed municipal solid waste. Contents include: Steps to resource recovery; Study (Resource recovery task force, Areas for study, Setting local goals, Outside planning/implementation assistance); Selection (Major decisions to be made, Technology - market, Financing, Operation, Procurement strategy); Procurement (Procuring a consulting engineer, Procuring a system contractor).

36681 (SAA—EMR11) Some administrative and jurisdictional aspects of district heating. (Smith, Auld and Associates Ltd. (Canada)). Dec 1976. 43p. (CE—01493). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

This study was undertaken to investigate and report on the institutional implications of introduction and operation of district heating systems in Canada. It focuses upon the relationship between the administrative and jurisdictional components at the local, regional, provincial and, where relevant, federal levels of government and would determine to what extent such administrative and jurisdictional relationships may or may not constitute barriers to the design, construction, operation, and maintenance of district heating systems. Three were chosen for examination. The first was an old system, in place for many years, in Winnipeg. The second represented a new district heating system being set up in Toronto. The third was a new system in the conceptual stage planned for the new town being created in North Pickering. The Winnipeg and Toronto systems use steam as the heating medium; in Pickering, consideration is being given to the use of hot water. The work program adopted included perusal of available literature, and discussions with public servants at all three levels of government and with representatives of consulting engineering and legal firms associated with the three district heating systems examined. The data so collected were consolidated and analyzed. Some of the administrative and jurisdictional problem areas associated with district heating, and some options which might be considered in alleviating such problems, are indicated. 11 refs.

36682 (SVF—272) Cooling of district heating water in existing consumer substations. Winberg, A.; Werner, S. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Aug 1987. 94p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753344/JAW.

The annual average cooling (in degrees Celsius) is estimated by using the ratio between the annual heat supplied and the annual amount of distribution water circulated through the substations. For the year 1985, these data have been gathered from 8591 substations in 7 Swedish district heating systems: Vaenersborg, Uddevalla, Boraas, Stenungsund, Moelndal, Goeteborg, and Stockholm. The annual average cooling has been estimated for each substation, and the estimations obtained have been correlated to consumer category (consumption pattern), date of connection to the district heating network (age), and the annual heat supplied (size). The analysis shows that neither consumption pattern, age, or size can explain the large differencies in annual average cooling among the various substations. Only a slight correlation to these three parameters was discovered. Dwelling and detached houses have about 20 per cent better cooling than other consumer categories, since the fraction of hot water supply in the heat load is high in these substations. The annual cooling is somewhat lower in older substations than in new ones. But many new substations have a lower temperature reduction than older ones. A similar weak correlation is present between cooling and size. Small substations have a cooling which is lower than the cooling for large substations. The lack of a strong correlation to consumption pattern, age, and size indicates that individual defects in the substations causes a bad temperature reduction of the distribution water. (authors).

36683 (SVF—286) Alarm systems - compatibility. Bodin, C.; Ljungqvist, J.; Rundstroem, T. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden); Studsvik Energiteknik AB, Nykoeping (Sweden)). Nov 1987. 69p. (In Swedish). (STUDSVIK-ED—87-5). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752991/JAW.

The following report gives the status on the technique to indicate moisture in the PUR-foam insulation of district heating networks. The report gives the technical status of the electronic systems for moisture detection of August 1986. The report also gives some views on strategies for thunderstorm protection and strategies to gain a certain degree of exchangeability. A laboratory test to investigate the influence on electrical resistance due to moisture penetrating into the insulation during construction of district heating network is presented. Results are discussed. A presentation is given concerning experiences made in the field, during 1985-86, regarding electrical resistance if water is leaking into the foam due to faulty welds on the service pipes. The report ends by giving some suggestions on drawing standards for electronic alarm system for leak detection. (authors).

36684 (VTT-PUBL—40) Mathematical model for strategy evaluation of municipal solid waste management systems. Kaila, J. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Sep 1987. 74p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753353/JAW.

A mathematical model for strategy evaluation of municipal solid waste management systems has been developed. The basic objective in model development has been to create a tool for practical strategy evaluation applications. The model is more comprehensive than earlier models in taking into account all the functional elements of a waste management system. Thus a wider range of technical alternatives and possible policy decisions and their effects can be analysed.

36685 The ORNL integrated forecasting system. Rizy, C.G. (Oak Ridge National Lab. (US)). pp 10.1-10.20 of Proceedings of the Maryland conference on electric utility load forecasting. Kahal, M.I. Annapolis, MD; Maryland Power Plant Siting Program (1983). (CONF-8306162—). Contract W-7405-ENG-26.

From Conference on electric utility load forecasting; Annapolis, MD, USA (8 Jun 1983).

This paper describes the integrated system for forecasting electric energy and load. In the system, service area models of electrical energy (kWh) and load distribution (minimum and maximum loads and load duration curve) are linked to a state-level model of electrical energy (kWh). Thus, the service area forecast are conditional upon the state-level forecasts. Such a linkage reduces considerably the data requirement for modeling service area electricity demand.

36686 (BCU/FC—021981) Producer, retailer and consumer perspectives on Canada's energy. Labelling program for major appliances. Claxton, J.D.; Anderson, C.D. (British Columbia Univ., Vancouver (Canada). Faculty of Commerce and Business Administration; Manitoba Univ., Winnipeg (Canada). Faculty of Administrative Studies). Feb 1981. 63p. (CE—01417). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

In 1987 Canadian manufacturers began placing Energuide labels on refrigerators to comply with new regulations requiring energy consumption labelling on major appliances. An initial study, a field experiment, assessed the effect of energy labels on refrigerator purchasers. The recommendations put forward by the initial report dealt with future research and priorities for Energuide program management. This study addresses the recommendation to conduct diagnostic surveys using trained shoppers and consumer interviews in order to indicate the effectiveness of specific manage-

ment initiatives. Three major objectives were to interview manufacturers to assess impact in terms of product changes and energy related promotional emphasis, to interview retailers to assess impact in terms of products carried and energy emphasis by retail salespeople, and to interview consumers to assess impact on awareness, attitudes and behavior regarding appliance energy useage information. The supplementary paper that followed the initial report drew attention to the market segment where Energuide labels had had most impact. Consumers buying refrigerators in the 10 to 14 cubic foot range (where manual defrost was a viable option) were identified as most receptive to energy information. The current study reconfirms the significance of energy lables to this segment. Review of the study indicates that clear progress in label impact has been achieved. 1 fig., 10 tabs.

36687 (DOE/MI—0010-Vol.1) Project to design and develop an energy-related program: For public housing residents and renters: Volume 1, Final report. (Assignment Group, Rockville, MD (USA)). May 1988. 43p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010724/JAW.

This demonstration project was undertaken as a result of an unsolicited proposal submitted by THE ASSIGNMENT GROUP (TAG) to the Office of Minority Economic Impact, Department of Energy (DOE). The problem to which the proposal responded was how to minimize the costs associated with public housing tenants in standard public housing as well as under homeownership transfers. A related problem was how to graduate the tenants to another level of responsibility and self-sufficiency through resident business developments and training in energy-related fields. The size and gravity of the problem necessitated a purpose or aim that had nationwide application, yet lent itself to a microscopic look. Consequently, the goal that emanated was the design and development of an energy-related demonstration program that educates public housing residents, facilitates indigenous business development where appropriate, and trains residents to provide needed services.

36688 (DOE/MI—0010-Vol.2) Energy conservation practices participant manual: For public housing residents and renters. (Assignment Group, Rockville, MD (USA)). May 1988. 28p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010725/JAW.

This training manual focuses on actions which residents can take to improve energy conservation in their homes. (BCS)

36689 (MU/RG—101981) Communications effects and energy conservation. An annotated bibliography. Filiatrault, P. (Montreal Univ., Quebec (Canada). Centre de Recherche en Gestion). Oct 1981. 162p. (CE—01438). CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $0.34CAN per page, $3.40 CAN minimum.

The bibliographic work presented in this document provides a thorough review of information published in English on the state of the art in communication research as perceived in the discipline of marketing. The main objective of this research was to investigate existing knowledge on the measurement of communication effects. The domain of application was consumer energy conservation more specifically but it was expanded to include other various public and nonprofit sector applications. Two well-known models provide the theoretical background for the analysis of the publications considered in this bibliography. Types of effects, measurements, and research designs were also investigated. The definition of the categorization used concludes the section on methodology. Results are then presented. A preliminary classification with regards to interest is provided, followed by a classification according to content and research design. Finally, implications for public communications policies are drawn. 271 refs.

36690 (PNL—6572) Trends in household energy conservation attitudes and behaviors in the northwest: 1983-1987. Schultz, R. W.; Bailey, B. M. (Pacific Northwest Lab., Richland, WA (USA)). Jun 1988. Contract AC06-76RL01830. 66p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88011537/JAW.

The objective of this report is to present the results of a 1987 telephone survey on attitudes and behaviors toward energy conservation and to compare them with the results of similar surveys in 1983 and 1985. The surveys were conducted in the Bonneville Power Administration (BPA) service area: Washington, Oregon, Idaho and Western Montana. Data collected during the surveys were analyzed by Pacific Northwest Laboratory to assist the BPA in its energy conservation program planning, design, and marketing.

36691 (AD-A—190697/3/XAB) Development of a laboratory test for multiport injector deposits: approaches 1 and 2. Final report. Stavinoha, L.L.; Estefan, R.M.; Marbach, H.W. (Southwest Research Inst., San Antonio, TX (USA)). Sep 1987. 56p. (SWRI—4765/1). NTIS, PC A04/MF A01.

This report evaluates a novel approach for measuring MPFI(Multiport Fuel Injectors) injector deposit-forming tendencies of fuel. By slowly coating a cylindrical metal surface with a thin film of gasoline and applying sufficient amounts of heat in alternate cycles of coating and soaking, two critical requirements of deposit formation were used. The deposit generated from a known injector-fouling fuel (fuel A) were measured gravimetrically and compared to a relatively clean fuel (fuel C). Significantly greater concentrations of deposits were measured from fuel A when compared to fuel C. Fuel A was treated with 2 different types of additives-polymeric and amine-from 4 different manufacturers at high, clean-up levels and low, keep-clean concentrations and evaluated by the Bomb Method. Very few deposits were measured by any of the additive-treated fuels at high or low treatment levels. Greatly reduced levels of each additive in fuel A were tested for additive response by measuring deposit formation of as a function of additive concentration. Several additives appeared to begin losing their efficacy at lower concentrations in fuel A. With an improved design of the delivery system and optimization of experimental parameters, the Bomb Method promises to be a viable bench test method for measuring the deposit-forming tendencies of fuel.

36692 (DOE/AL/16310—T2) Modelling of premixed combustion using a thin flame sheet and the effect of the hydrodynamic instability. Ghoniem, A.F.; Knio, O.M. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Mechanical Engineering). [1987]. Contract AC04-81AL16310. 54p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88009467/JAW.

A dynamic thin flame model that introduces the effect of flame structure on the burning velocity is described and appropriate numerical schemes are constructed to obtain solutions in configurations with available experimental data for validation. Using this model, the role of the hydrodynamic instability, which arises due to the imbalance between the flow and the local burning velocities, on the evolution of the flame front and the pressure history during the combustion of premixed gases in confined chambers is investigated. It is shown that the hydrodynamic instability plays an important role and that accurate modeling can only be achieved if the stabilizing effect due to flame curvature is included, in the formulation. The problem is relevant to the modeling of combustion in engines, pressure rise due to confined explosion, and the analysis of processes governed by flame-flow interactions. Results provide an interpretation for phenomena associated with large scale distortion of flames and shed light on their underlying mechanism.

36693 (DOE/AL/38221—T3) Experimental validation of a zero-dimensional computer model for spark-ignition engines: Progress report. Scott, R.L. Jr. (Southern Univ., Baton Rouge, LA (USA). Dept. of Mechanical Engineering). 25 Apr 1988. Contract AS04-86AL38221. 30p. NTIS, PC A03;3. Order Number DE88009034/JAW.

This is a progress report on the subject contract. It contains a discussion of progress made to date on the engine design, and the computer code used for analysis. It also contains a statement on progress expected during the next reporting period.

36694 **(DOE/METC—87/0245) Coal-fueled heat engines: Technology status report.** (USDOE Morgantown Energy Technology Center, WV). Oct 1985. 99p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE87001026/JAW.

The Department of Energy, Office of Fossil Energy, through the Morgantown Energy Technology Center, is sponsoring activities to extend the technology base for coal-fueled heat engines. The heat engines of primary interest are the gas turbine and the diesel engine. The overall objective is the development of the technology base necessary for private-sector commercialization of complete and integrated heat engine systems that produce power from coal in an economically competitive and an environmentally sound manner. The objective will be attained through technical advances in four interactive program phases: feasibility validation, engineering development, advanced engineering development, and system integration. Efforts through FY 1985 have been concentrated in the feasibility validation and engineering development phases. These program phases are directed towards the identification of the most critical performance-limiting problems associated with the direct combustion of coal or minimally-cleaned, coal-derived gas in heat engines. Technology status and accomplishments in the areas of fuels technology, component development, contaminant control, and systems integration are presented in this report. 9 refs., 34 figs., 12 tabs.

36695 **(PB—88-181631/XAB) Operational Characteristics Study, Columbus, Ohio program. Technical report.** Thompson, G.; McCoy, R.; Hoekwater, M.; Snapp, L.; Schuler, A. (Environmental Protection Agency, Ann Arbor, MI (USA)). Aug 1987. 245p. (EPA/AA/SDSB—87/08). NTIS, PC A11/MF A01.

This report describes the Columbus, Ohio, program of the Operational Characteristics Study (OCS) which monitored the driving patterns of 47 private citizens in Columbus, Ohio, over a nine-month period from April 1983 to January 1984. These citizens were loaned one of four vehicles equipped with time, speed, distance, and temperature recording devices to gather a total of 251 days of in-use data. The report describes the details of the program, the results, and a comparison of the average-trip statistics to the Federal Test Procedure used in exhaust emissions testing for motor vehicles.

36696 **Nitric oxide emissions from a coal-fueled engine: Numerical results.** Caton, J.A.; Schmidt, J.; Roth, J.; Bachman, F. New York, NY; American Society of Mechanical Engineers (1988). 6p. (CONF-880104—). American Society of Mechanical Engineers, 345 East 47 St., New York, NY 10017.

From 11. annual energy-sources technology conference and exhibition; New Orleans, LA, USA (10 Jan 1988).

Technical Paper 88-ICE-22.

A cycle simulation for coal-fueled, reciprocating, internal combustion engines has been expanded to include calculations of nitric oxide exhaust emissions. Calculations have been completed for a diesel oil and a coal-water slurry fuel. The fuels were assumed to be direct injected and compression ignited. The numerical simulation was based on a thermodynamic analysis with models for the injection, ignition, mixing, combustion, and heat transfer. The calculations of the nitric oxide formation and reduction reactions were based on the Zel'dovich mechanism. The engine performance parameters were in good agreement with published values in the literature. The computed exhaust nitric oxide concentrations for both the diesel and coal-water slurry fuels were in fair agreement with recent preliminary experimental values from the literature. In general, the exhaust nitric oxide concentrations were lower for the coal-water slurry fuel relative to the diesel fuel. The thermal nitric oxide production for the coal-water slurry fuel was a strong function of the coal/water mass ratio for the conditions examined. Also, rough estimates indicated that the nitric oxide from fuel-bound nitrogen could be significant for typical coal-water slurry fuels.

36697 **(CONF-880279—1) The outlook for ceramics in heat engines, 1990-2010: Results of a worldwide Delphi survey.** Larsen, R.P.; Vyas, A.D. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 24p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010075/JAW.

From Worldwide perspective on the status of ceramics for heat engines; Detroit, MI, USA (29 Feb 1988).

A study is described that was conducted to provide a realistic technical and economic assessment of the use of advanced ceramic materials technology for heat engines in transportation applications. Key results from a worldwide Delphi survey are presented on the expected timing and rate of market development for ceramic engine components and engines. These results show that, by the mid 1990s, a substantial number of ceramic engine components will be in production and ceramic-intensive engines will be introduced. Also presented in the study are benefits and barriers to the use of ceramic technology in heat engines and other relevant factors influencing its rate of adoption. A modeling approach is presented that uses the survey data to produce a series of market penetration curves for individual ceramic engine components for light- and heavy-duty applications under different scenarios. Finally, the conditions required for rapid market development of ceramic technology for heat engines are discussed.

36698 **(NEI-DK—55) Utilization of exhaust gases from a diesel engine for operating stirling engines.** Bak, F.; Monrad, K. (Jysk Teknologisk, Aarhus (Denmark)). Sep 1987. 121p. (In Danish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752831/JAW.

The Danish Ministry of Energy has financed this technical and economical investigation of waste heat recovery from diesel exhaust by means of a stirling engine. This report gives a description of the previously established optimal heat transfer. A computer program developed for calculation of the obtainable energy savings is described in detail. A financial evaluation proves the system to be unprofitable for ship economy as the price of the waste heat utilization system cannot compete with the present fuel oil prices (DKr 1.10 p. litr). The profit depends entirely on the oil market prices. (EG).

36699 **Reliability study of Stirling engines for solar-dish/heat engine systems.** Holtz, R.E.; Uherka, K.L. (Argonne National Lab., Argonne, IL (US)). pp 1885-1890 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—).

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879414.

The objective of this study was to examine the reliability of existing and improved Stirling engine concepts for dispersed solar-dish/electric applications in the 25-50 kWe range. Five current kinematic Stirling engine designs have the capability to meet or exceed the 32% system efficiency goal of the DOE Solar Thermal Program. Experience with the Vanguard Solar-Dish/Stirling Engine module demonstrated that the 32% efficiency goal is realistic, but that improved Stirling engine reliability is necessary for successful implementation of dispersed solar power systems. A review of historical Stirling engine data illustrated that the three major reliability issues with kinematic Stirling engines are the piston-rod seals, engine hot parts and power control/drive system. A specific kinematic engine concept that appears to have the potential for meeting the 50,000-hour operating lifetime requirement of solar power systems has a pressurized crankcase to reduce piston-rod seal problems, an indirectly heated hot-end section using heat pipes to smooth out temperature gradients in the heater tubes, and a variable-angle swashplate for power control. Further development efforts are required to establish reliability and validate performance goals of these engine concepts.

36700 **Fundamental flow and heat transfer results relevant to oscillating flow regenerators.** Hutchinson, R.A.; Ross, B.A. (Pacific Northwest Lab., Richland, WA (US)). pp 1859-1865 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—).

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879343.

Complete understanding of the operation of Stirling and other heat engine regenerators has evaded engineers working on engine development because making measurements in or near such a regenerator is difficult. Some illumination of the physics that may be involved, however, can be found by studying fundamental experimental results in the literature, results that were examined for other applications in addition to Stirling. Preliminary reviews of literature on the subjects of oscillating flows, periodic flows and porous media have brought to light interesting papers presenting a number of phenomena that may be of importance in heat engine regenerators. Some are also relevant to flows in other Stirling heat exchangers. These topics include heat tranfser during compression and expansion, enhanced conduction in oscillating laminar flows, approaches to analysis of nonuniform porous media, and heat transfer enhancement mechanisms in porous media. Each topic is briefly described and discussed in this paper, and a summary of physical phenomena that may affect regenerator performance is presented.

36701 **Mod II engine development.** Karl, D.W. (Mechanical Technology Inc., 968 Albany-Shaker Road, Latham, NY 12110 (US)). pp 1810-1816 of Proceedings of the 22nd intersociety energy conversion engineering conference. New York, NY; American Institute Aeronaut and Astronaut (1987). (CONF-870804—).

From 22. intersociety energy conversion engineering conference; Philadelphia, PA, USA (10 Aug 1987).

Technical Paper 879158.

The Mod II engine is a four-cylinder, automotive Stirling engine utilizing the Siemens-Rinia double-acting concept. It has a single crankshaft and the cylinders are arranged in a 'vee' configuration with two cylinders in each bank. It is the culmination of nine years of design, development, and testing efforts that began in 1978. The primary objective of the program is to demonstrate, by early 1988, a Stirling-engine-powered automobile with 30% greater fuel economy than its counterpart, the gasoline-fueled, internal-combustion engine. The Mod II engine was assembled and became operational in January 1986. It was operated in a dynamometer test cell using facility-supplied auxiliaries and controls. The complete engine system is scheduled to start testing in June 1987, and its installation into the vehicle should be accomplished by late 1987. This paper describes the Mod II engine, its first assembly, and the subsequent work done on engine components up to the point that engine performance characterization testing took place. Performance data for the engine is included.

3303 Electric-powered Systems

36702 **(DOE/CE—0213) Electric and Hybrid Vehicles Program: 11th annual report to Congress for fiscal year 1987.** (USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC. Office of Transportation Systems). Mar 1988. 42p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010339/JAW.

This eleventh annual report on the implementation of the Electric and Hybrid Vehicle Research, Development and Demonstration Act of 1976 (Public Law 94-413, as amended by Public Law 95-238, and Public Law 96-185), referred to as the Act, complies with the reporting requirements established in Section 14 of the Act. In addition to informing Congress of the progress and plans of the Department of Energy's Electric and Hybrid Vechicles Program, this report is intended to serve as a communication link between the Department and all of the public and private interests involved in making the program a success. During FY 1987, significant progress was made toward fulfilling the intent of the Congress in the Act. There has been continuing interest shown by both the automobile manufacturing and supply sectors of our economy in electric and hybrid vehicles. The three major domestic automobile manufacturers are all devoting some effort towards electric vehicles. Their participation includes cost-shared contracts with the Department of Energy and the Electric Power Research Institute as well as independently funded activities. Research and development efforts in batteries and propulsion components continue to achieve significant progress in providing industry with technology options that will result in vehicles that will be more economically competitive and more acceptable to the public.

36703 **(PB—88-863501/XAB) Electric vehicles. January 1970-May 1988 (Citations from the US Patent data base). Report for January 1970-May 1988.** (National Technical Information Service, Springfield, VA (USA)). May 1988. 94p. NTIS PC N01/MF N01.

Supersedes PB—87-860615.

This bibliography contains citations of selected patents concerning design techniques of electric vehicles for road and rail transportation. Drive and control systems for electric vehicle operation are discussed. Battery recharge, replacement, and monitoring methods and systems are presented. Solar energy, wind power, and manual devices used in charging batteries are considered. (This updated bibliography contains 204 citations, 24 of which are new entries to the previous edition.)

36704 **(SAND—88-1421C) Sodium/sulfur cell evaluation results.** Freese, J.M.; Butler, P.C. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 19p. (CONF-8806127—5). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011488/JAW.

From 7. DOE/EPRI beta battery workshop; Toronto, Canada (1 Jun 1988).

Sandia National Laboratories has been evaluating the performance of various sodium/sulfur cells since 1985. The objectives of these evaluations were to characterize the performance of these cells, determine their longevity, identify performance or life limiting design problems, and conduct post-test analyses to determine the cause of failure. These results were communicated to each developer with recommendations for design improvements or other suggestions to resolve problem areas.

3306 Vehicle Design Factors

36705 **Advanced chemical laser cavity fuel injection system.** Morr, G.F.; Pruett, S.L. (to Secretary of the Army, Washington, DC). US Patent 4,737,965. 12 Apr 1988. Filed date 2 Jan 1987. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes a chemical laser cavity fuel injection system, a converging-diverging nozzle for accelerating an oxidizer at a supersonic Mach number. The converging-diverging nozzle has opposite diverging walls that terminate at an exit plane of the converging-diverging nozzle. A boundary layer region is adjacent each diverging wall, a pair of manifolds are mounted relative to the converging-diverging nozzle structure and at the exit plane of the converging-diverging nozzle where the diverging walls terminate. Each of the pair of manifolds has fuel injection wedges connected thereto with fuel ports, thereein for injecting fuel therethrough. The wedges of each of the pair of the manifolds project in opposite directions and across a portion of the converging-diverging nozzle exit plane from one diverging wall toward the other and each of the wedges terminate at one of the boundary layer regions to define a multiplicity of wedges that are mounted on the pair of manifolds in a staggered arrangement so that each wedge is fed fuel from one end and terminated at another end before projecting across the one of the boundary layer regions to cause pressures and Mach numbers from flow through the nozzle and at spaced positions across the nozzle to be more uniform due to the wedges being staggered and terminating at the one of the boundary layer regions to thereby reduce pressure losses through the nozzle and cause a more efficient lasing medium to be produced.

3307 Emission Control

36706 (PB—88-195219/XAB) Motor vehicles as sources of compounds important to tropospheric and stratospheric ozone. Black, F.M. (Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab.). Apr 1988. 30p. (EPA—600/D-88/067). NTIS, PC A03/MF A01.

One of the most-rapidly growing human activities in the U.S. of importance to atmospheric ozone is the use of highway motor vehicles. Transportation sources are estimated to have been responsible for about 34% of 1985 U.S. anthropogenic hydrocarbon emissions, 70% of carbon monoxide emissions, 45% of nitrogen oxide emissions, 24% of nonaerosol chlorofluorocarbon emissions, and 14% of carbon dioxide emissions. Data are presented describing possible uninventoried transportation hydrocarbon emissions that could increase their estimated contribution to 45 - 50% of the anthropogenic total. Data is also presented suggesting motor vehicles to be relatively insignificant sources of anthropogenic nitrous oxide, but noting that these emissions are increased by the control technologies used to reduce hydrocarbon, carbon monoxide, and nitrogen oxides emissions. The sensitivity of motor-vehicle emission rates and compositions to such operating variables as ambient temperature, altitude, and average speed is discussed.

36707 (VTT-TUTK—496) Automotive exhaust emissions at low ambient temperature. Laurikko, J.; Nylund, N.-O.; Sipilae, K. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Aug 1987. 41p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752876/JAW.

Cold ambient conditions have a distinct impact on the total emission of the Finnish car park because climatic conditions in Finland are rather severe regarding the use of automobiles. In the present study, the exhaust emission characteristics of three automotive petrol engines with different fuel metering systems were evaluated. Experiments were carried out on an engine and exhaust system combination in cold chamber at a constant ambient temperature ranging from +20 deg C to -30 deg C. Test procedures included either constant or variable load mode during a 30 minute run. The test results show that the use of the enrichment devices necessary during cold-start and warm-up period has a major impact on the total emissions during the test. In the carburetted non-catalyst engines the share of the initial emissions during cold-start and warm-up phase was smaller than with the fuel-injected catalyst version. The catalytic converter equipped version was also found to be far more sensitive to the low ambient temperature than the normal carburetted versions without exhaust aftertreatment. The relative increase in CO and HC emissions when the ambient temperature was lowered was in case of the fuel-injected catalyst engine some 5 to 15 times greater than with the normal carburetted version of the same engine. Although the temperature of the converter rose quite quickly after the cold start it did not promote the conversion, because the enrichment circuit of the fuel injection system overriched the air-fuel mixture, thus optimising the driveability, but making the operation of the three-way catalytic converter impossible. The carburetted test engines were found to be quite sensitive to intake air temperature.

3308 Alternative Fuels

REFER ALSO TO CITATION(S) 35926

36708 (CONF-880180—2) The past and future of the petroleum problem: The increasing need to develop alternative transportation fuels. Santini, D.J. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 37p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010089/JAW.

From 67. annual transportation research board meeting; Washington, DC, USA (11 Jan 1988).

An examination of the interactions of petroleum supply and demand patterns suggests that the depletion of US oil reserves and the increasing importance of oil consumtion in US transportation are causes for greateer attention to the development of alternative (non-oil based) transportation fuels. Absent such development, the historical lessons in this paper suggest that another period of rising oil prices, erratic oil market behavior, and subsequent economic difficulty is probable within the next two decades. Methanol is argued to be the most likely and most desirable substitute transportation fuel, because it can be produced more econmically and used more efficently than gasoline derived from the rapidly expanding worldwide supplies of natural gas.

36709 (GAO/RCED—88-38BR) Alternative fuels: Information on DOE's Methanol Vehicle Demonstration Program. (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 1987. 16p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The Department of Energy established a methanol vehicle demonstration program to encourage the fuel's increased use by stimulating the commercial readiness of methanol-fueled vehicles. This report discusses why other federal agencies have not participated in the program, DOE's experience in acquiring and operating demonstration fleets, coordination between the DOE and Department of Defense programs, and a recent initiative to acquire flexible-fueled vehicles that can operate on gasoline, methanol, or a combination of both fuels.

36710 (PB—88-188909/XAB) Gas-engine durability improvement - topical report. Final report for Phase 1 information gathering. Report for October 1985-June 1986. Treuhaft, M.B.; Klusmeyer, L.F.; Brown, R.D.; Hull, R.W. (Southwest Research Inst., San Antonio, TX (USA). Dept. of Engine and Vehicle Research). Jun 1986. 92p. NTIS, PC A05/MF A01.

The need to improve the durability of natural gas-fueled engines by eliminating or reducing exhaust valve and valve-seat failures is being addressed. The report covers the information and data gathering phase. A literature search was conducted to investigate the historical treatment of valve and valve-seat wear and to determine the state-of-the-art with respect to the design and use of exhaust valves and seats. Visits were made to natural gas-fueled engine users, maintenance shops, engine manufacturers, and valve and valve-seat-insert manufacturers. Valve and valve-seat problems were found to be a maintenance concern. Manufacturers reported that valve and seat-insert materials requirements for gas engines are more stringent than for gasoline or diesel engines. The type of engine oil used is thought to have a strong influence on valve/seat durability; low-ash or no-ash oils are preferred. Phase II will evaluate different valve and seat materials as well as various formulations of lubricants.

36711 (VTT-TIED—771) Suitability of fuel blends containing 30-60% methanol to Finland's conditions. Eklund, T. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Oct 1987. 43p. (In Finnish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752995/JAW.

The aim was to study with the aid of laboratory tests and a one-car field experiment, how high a methanol content can be used in methanol-gasoline fuels in Finland's conditions without any appreciable changes in cars, such as installation of cold-start systems. The fuels studied were so-called MX fuels with 30-60% methanol content. In the laboratory tests, phase separation was studied by adding water to the fuel. The higher the methanol content, the better the water tolerance of the fuel was. There is no greater risk of separation in careful fuel handling, when using the fuels studied. Material tolerance was studied both by soaking parts of the fuel system and by monitoring the condition of the field test car. The soaked parts, specially certain metal ones, corroded significantly. Cold-start experiments were done both on a test engine in a cold research room and with the car as a field experiment. The methanol content of the MX fuels should be 30-40%, with regard to differences in the properties of various engines, to quarantee a sufficient cold-start reliability. In the field experiment, the driveability of the car was the most significant factor. It was satisfactory during the winter as well. Only the nozzle of the carburettor had to be changed and the preheating of intake air improved. The results of

exhaust gas experiments and fuel consumption were equal or superior to those obtained with gasoline.

36712 **(VTT-TIED—772) Ethanol as a fuel of a lorry. Use experience from a diesel engine modified to an otto engine.** Nylund, N.-O.; Eklund, T. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Oct 1987. 66p. (In Finnish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752870/JAW.

When using alcohol for the fuel of a diesele, either the engin engine or the fuel must be converted due to the poor ignition of alcohols. A direct injection diesel engine is usually easy to convert into an otto engine. The otto version is technically simple, although its efficiency is lower than that of a diesel engine. The limit values of performance and the driveability characteristics of a simple otto engine version were determined in the test. This otto engine version could be of significance in a crisis provided that alcohol fuels are available. There is also a rising interest in alcohol-fueled spark-ignition versions in developing countries. A Finnish-made Valmet 611 turbo diesel engine was chosen for conversion. No special parts were used in this work. The engine was first driven in an engine dynamometer. The maximum power of the free-respiration ethanol version was about 85% of that of a turbo diesel and the peak thermal efficiency was 34%. For the evaluation of driveability, the converted engine was installed in a Karhu-Sisu lorry. The lorry was driven about 8500 km with E90 fuel. The performance values of the lorry were on average 15% lower for the ethanol-fueled engine than for the original diesel. The average fuel consumption was 52 l/100 km during the test, corresponding to aboaut 30 l/100 km for a diesel engine. Hence, the energy consumption was about 20% higher than that of a diesel engine. The tests indicated that it is relatively easy to convert a diesel engine to a spark-ignition one and to achieve a satisfactory level of performance. The performance and availability of the alcohol engine is by far superior to a producer (wood) gas engine.

36713 **Concentric layer ramjet fuel.** Burdette, G.W.; Francis, J.P. (to Secretary of the Navy, Washington, DC). US Patent 4,729,317. 8 Mar 1988. Filed date 8 Dec 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes a solid fuel ramjet grain comprising concentric layers of solid ramjet fuel having a perforation therethrough along the center axis of the grain. The perforation is connected to a combustion after-chamber. The solid ramjet fuel layers comprises a pure hydroxyl-terminated polybutadiene hydrocarbon fuel or a mixture of a hydroxyl-terminated polybutadiene hydrocarbon fuel and from about 5 to about 60 percent by weight of an additive to increase the fuel regression rate selected from the group consisting of magnesium, boron carbide, aluminum, and zirconium such that, when buried in the operation of the ramjet, each fuel layer produces a different level of thrust.

36715 **(AD-A—190476/2/XAB) Measures and trends, US and USSR strategic force effectiveness. Sanitized. Final report, May 1977-July 1978.** Paolucci, D.A.; Wikner, N.F.; Trapold, A.C. (Santa Fe Corp., Alexandria, VA (USA)). Jul 1978. 271p. NTIS, PC A12/MF A01.

Sanitized version of report dated July 1978, AD-C016 317; Availability: Document partially illegible.

This report is a compilation and description of the measures of effectiveness that have been used in the analysis and comparison of US and USSR strategic nuclear forces and weapons systems. The primary purpose of the report is to provide an understanding of the measures of effectiveness that can be used in an analysis of the strategic balance. Although a knowledgeable strategic analyst may consider some of the discussions elementary, the manner of presentation was selected to make the report useful to a wide range of readers. Historical trend plots of thirteen general measures of effectiveness and relevant subsets of these measures of effectiveness are presented. For each measure, a description that identifies the limitations and uncertainties associated with the particular measure is provided: The thirteen basic measures considered are: Strategic Nuclear Delivery Vehicles; Independently Targetable Warheads; ICBM Throw-Weight; SLBM Maximum Range; Gross Yield; Equivalent Megatons; Lethal Area Potential; Weapon System Delivery Accuracy; Hard Target Kill Capability; Counter Military Potential; Surviving ICBM Launchers; Retaliatory Equivalent Weapons; Strategic Defensive Systems.

36717 **(AD-A—190407/7/XAB) Investigation and synthesis of high-temperature and increased-stiffness RSP aluminum alloys. Annual report, 1 October 1986-30 September 1987.** Fine, M.E.; Weertman, J.R. (Northwestern Univ., Evanston, IL (USA). Dept. of Materials Science and Engineering). Sep 1987. 21p. NTIS, PC A03/MF A01.

The objective of this research is to investigate two promising systems as the basis for high-temperature aluminum alloys useful to 425 C (800 F). The first is a metal-matrix composite consisting of an aluminum-magnesium alloy matrix reinforced by spinel (magnesium aluminate) particulate. The second system is tri aluminum (zir-

conium, vanadium) dispersed in aluminum matrix; here the lattice parameter matches that of the matrix. Research on dilute alloys has shown a low coarsening rate for this intermetallic at 425 C. Study of more-concentrated alloys is underway. A mechanical alloying liquid-metal infiltration procedure for preparing specimens of the aluminum alloy matrix spinel composite was worked out and specimens with 4 vol% spinel were prepared. Also, 4 vol.% alumina composite samples were prepared for comparison. Spinel particles were within the aluminum alloys grains in contrast to the alumina which was at grain boundaries. The spinel composite had much better creep resistance at 410 C. Extrusions containing 5 vol.% trialuminum (0.75 vanadium, 0.25 zirconium) were prepared for this research by Lockheed-Palo Alto from rapidly solidified foil. The measured creep rate at 425 C is much lower than in the current aluminum-iron-cerium alloy. An aluminum-vanadium intermetallic compound, however, forms at grain boundaries leading to a precipitate-free zone which grows slowly at 425 C.

36718 (AD-A—190510/8/XAB) Growth of corner cracks under the conjoint action of high- and low-cycle fatigue. Final report, June 1985-June 1987. Powell, B.E.; Henderson, I.; Hall, R.F. (Portsmouth Polytechnic (UK). Mechanical Behaviour of Materials Lab.). Feb 1988. 98p. NTIS, PC A05/MF A01.

Fatigue-crack propagation rates were measured for Ti-6A1-4V and Ti-5331S aeroengine disc materials using compact tension and corner-notched tensile test-pieces. The loadings used simulate both the start-stop operations of aeroengines which lead to low-cycle fatigue and the in-flight vibrations which may cause high-cycle fatigue. It is suggested that the different fatigue crack-growth behavior of Ti-5331S, relative to that of Ti-6A1-4V, arises largely from the greater proportion of crack closure and short crack growth occurring in this alloy.

36719 (AD-A—190537/1/XAB) Theory of liquid-phase sintering: model experiments on W-Ni-Fe heavy alloy system. Farooq, S.; Bose, A.; German, R.M. (Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Materials Engineering). 1987. 14p. NTIS, PC A03/MF A01.

Pub. in Progress in Powder Metallurgy, Vol. 43, 65-77(1987).

Current liquid-phase sintering theories predict negligible densification prior to the formation of a liquid phase. While these theories are fully applicable to a few model systems, their validity is questionable under more general circumstances. Experiments on a 93% W-Ni-Fe heavy alloy show that nearly 94% of the total shrinkage occurs prior to liquid formation. In this study, densification behavior has been studied by means of constant heating rate dilatometry. The microstructural evolution during sintering was monitored by quantitative microscopic examination of samples quenched from various temperatures during heating. The actual amount of densification that occurs prior to liquid formation is observed to be a function of both material process parameters. It was found that the contribution of solid-state-enhanced sintering to densification increases with slower heating rates. Thus, the role of rearrangement in densification during liquid-phase sintering is of less importance in common commercial systems (like W-Ni-Fe), where the additive phase exhibits solubility for the major phase. Rearrangement becomes important only at faster heating rates, especially in low solubility systems. This paper demonstrates that the mechanisms proposed by current theories are inadequate to explain densification behavior during liquid-phase sintering. Finally, an alternative approach to understanding liquid-phase sintering is suggested; and the new theory is outlined.

36720 (AERE-R—12855) Thermal conductivity of oxide layers formed on the water side of a fast reactor evaporator tube. Silver, P.; Gilchrist, K. (UKAEA Northern Research Labs., Springfields). (UKAEA Harwell Lab. Chemistry Div.). Apr 1988. 13p. H.M. Stationery Office, London, price Pound 4.00.

Samples of a sodium heated heat exchanger tube with over 24,000 hours service at 310°C were obtained and their thermal diffusivities measured over the temperature range 290 -700°C. The effective thermal conductivity of the oxide layer was calculated from the results. It is proposed that the value obtained, 2.61 +- 0.45 $Wm^{-1}\,°C^{-1}$, can be used in calculations of the heat transfer in boilers.

36721 (ANL/FE—88-1) A review of solid particle erosion of engineering materials. Majumdar, S.; Natesan, K.; Sarajedini, A. (Argonne National Lab., IL (USA)). Dec 1987. Contract W-31109-ENG-38. 105p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88009363/JAW.

A detailed modeling effort was initiated to develop an analytical capability to predict corrosion/erosion behavior of structural materials in advanced fossil technologies. As part of this program, a literature search was conducted to collect the available erosion data on materials of interest in fossil energy technology and to evaluate the capability of the existing erosion models to correlate the data. Although a signficant literature on the review of erosion model already exists, most of these studies concentrate primarily on erosion of pure metals or simple alloys, for which these models were specifically developed. The purpose of the present study is to evaluate the ability of the currently available erosion models to correlate the erosion data on technologically important alloys. The materials of interest are broadly divided into four categories: low alloy steel, high alloy steel, nickel-based superalloy, and cobalt-based superalloy. 44 refs., 84 figs., 2 tabs.

36722 (BFR-R—109-1986) Problems due to precipitation of iron in groundwater-based heatpump systems. Lindblad-Paasse, A. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 143p. (In Swedish). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88752905/JAW.

This report deals with the problems due to precipitation of iron in groundwater-based heatpump systems. Fifteen installations have been examined, water and precipitate samples have been taken, microorganisms have been investigated and problems in running the installations have been studied. Proposals have been put forward for both preventive measures to stop precipitation of iron in the systems, and remedial measures to remove existing deposits. The ability of different materials to adsorb iron has been investigated in the laboratory.

36723 (BNL—41211) Anomalous rf magnetoresistance in copper at 4{degree}K. Halama, H.J.; Prodell, A.G.; Rogers, J.T.; De Panfilis, S.; Melissinos, A.C.; Moskowitz, B.E.; Semertzidis, Y.K.; Wuensch, W.U.; Fowler, W.B.; Nezrick, F.A. (Brookhaven National Lab., Upton, NY (USA)). Mar 1988. Contract AC02-76CH00016. 16p. NTIS, PC A03. Order Number DE88010232/JAW.

We have measured the effect of a magnetic field on the surface resistance of polycrystalline Cu at f = 1.2 GHz and at 4.4{degree}K; under these conditions the surface resistance is well into the anomalous skin effect regime but has not reached its limiting value. We find that the transverse and longitudinal magnetoresistance are an order of magnitude smaller than the DC magnetoresistance and depend quadratically on the field. At low fields we observe a decrease in surface resistance with increasing field which can be interpreted as a size effect of the TF surface current. 17 refs., 4 figs., 1 tab.

36724 (CEA—000G108) Uses and evaluation methods of potential hydrogen permeation barriers for nuclear reactor materials. Noga, J.O.; Piercy, G.R.; Bowker, J.T. (Canadian Electrical Association, Montreal, Quebec). Jul 1985. 141p. NTIS (US Sales Only), PC A07/MF A01. Order Number DE88702225/JAW.

This report summarizes results on the use of coatings as hydrogen permeation barriers on nuclear reactor component materials. Two classes of base materials were considered, exothermic hydrogen absorbers and endothermic hydrogen absorbers. The results of the tests indicate that substantial reductions in the amount of hydrogen absorbed by a metal can be achieved through the use of hydrogen permeation barrier coatings. Gold was determined to provide an effective hydrogen permeation barrier on Zr-2-1/2 Nb pressure tube material. Tin was determined to be a suitable hydrogen permeation barrier when applied on AISI 410 stainless steel and iron. Both gas phase and electrochemical permeation techniques were

used to determine hydrogen permeabilities through coatings and base materials.

36725 (CEA-CONF—9230) Fatigue analysis - computation of the actual strain range using elastic calculations (factor K/sub e/). Roche, R.L. (Institut National des Sciences et Techniques Nucleaires (INSTN), Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France); CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 24p. (CONF-8709279—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753454/JAW.

From 6. international conference on pressure vessel technology (ICPVT 6); Beijing, China (11 Sep 1987).

Pressure vessels are not eternal, their life is not endless, but must be long enough for profitable use. Fatigue is the most important damage limiting life time. It is due to variable loading and especially to deformation-controlled loading like thermal dilatation (thermal stress). Hence, it is of prime importance to perform an fatigue analysis in the design phase in order to be sure the pressure vessel life meet requirement of the design specification. It is also useful to perform such an analysis for assessing the remaining life. To compute the fatigue damage, knowledge of the strain range is needed. As calculation taking into account non linear behavior of the material are very expensive and not always reliable, the current practice is using elastic computation. The aim of this paper is to discuss the methods for correcting the elastically calculated strain range and to propose a sound and practical method.

36726 (CEA-CONF—9235) Simplified elastoplastic fatigue analysis. Autrusson, B.; Acker, D.; Hoffmann, A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 19p. (CONF-8708255—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753457/JAW.

From 2. international seminar on construction codes and engineering mechanics; Lausanne, Switzerland (24 Aug 1987).

Oligocyclic fatigue behaviour is a function of the local strain range. The design codes ASME section III, RCC-M, Code Case N47, RCC-MR, and the Guide issued by PNC propose simplified methods to evaluate the local strain range. After having briefly described these simplified methods, we tested them by comparing the results of experimental strains with those predicted by these rules. The experiments conducted for this study involved perforated plates under tensile stress, notched or reinforced beams under four-point bending stress, grooved specimens under tensile-compressive stress, and embedded grooved beams under bending stress. They display a relative conservatism depending on each case. The evaluation of the strains of rather inaccurate and sometimes lacks conservatism. So far, the proposal is to use the finite element codes with a simple model. The isotropic model with the cyclic consolidation curve offers a good representation of the real equivalent strain. There is obviously no question of representing the cycles and the entire loading history, but merely of calculating the maximum variation in elastoplastic equivalent deformations with a constant-rate loading. The results presented testify to the good prediction of the strains with this model. The maximum equivalent strain will be employed to evaluate fatigue damage.

36727 (CEA-CONF—9237) Modelizing ratcheting in biaxial tests. Guionnet, C. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 23p. (CONF-870850—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753459/JAW.

From Seminar on extreme load design of future nuclear plant facilities; Paris, France (24 Aug 1987).

A new constitutive equation has been developed on a purely phenomenological basis in order to interpret ratcheting experiments. The model is based on a generalized Arsmstrong-Frederick equation for the kinematic variable; the coefficients of this equation are functions of both instantaneous and accumulated plastic strain. The experiments described relate to austenitic stainless steel (17-12 SPH) tubular specimens subjected to cyclic torsional loading under constant tensile stress at 600 deg C. Comparisons between experimental and theoretical results show that the model reasonably well predicts not only ratcheting but also hysteresis loops and the cyclic hardening curve.

36728 (CEA-R—5415) Effect of heat and mechanical treatments on the microstructure of type Z6 CNDT 17.13 phosphorus containing, titanium stabilized austenitic stainless steels. Gandit, M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI); Conservatoire National des Arts et Metiers (CNAM), 75 - Paris (France)). Jun 1987. 67p. (In French). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753476/JAW.

The heterogeneities in composition resulting from hot transformation are eliminated by high temperature heat treatments. Phosphorus additions to this type of stainless steel does not affect significantly the homogeneity in composition. A significant lowering of the recrystallisaton temperature results from cold working. In addition, the precipitation of minute titanium-crystals is promoted as well as that of phosphorus at temperatures between 500 and 600oC. At concentrations in excess of 0.1 %, phosphorus precipitation induces a significant change in the crystal lattice. At high concentrations, phosphorus precipitates upon show heating or cooling (rate below 100 deg C/min) requiring a high temperature heat treatment to revert to solution (above 1000 deg C). This type of steel is chosen for fuel cans of LMFBR reactors.

36729 (CNEA-NT—6/86) Boron autoradiography method applied to the study of steels. Gugelmeier, R.; Barcelo, G.N.; Boado, J.H.; Fernandez, C. (Comision Nacional de Energia Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche). 1986. 17p. (In Spanish). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702228/JAW.

The boron state, contained in the steel microestructure, is determined. The autoradiography by neutrons is used, permiting to obtain boron distribution images by means of additional information which is difficult to acquire by other methods. The application of the method is described, based on the neutronic irradiation of a polished steel sample, over which a celulose nitrate sheet or other appropriate material is fixed to constitute the detector. The particles generated by the neutron-boron interaction affect the detector sheet, which is subsequently revealed with a chemical treatment and can be observed at the optical microscope. In the case of materials used for the construction of nuclear reactors, special attention must be given to the presence of boron, since owing to the exceptionaly high capacity of neutron absorption, lowest quantities of boron acquire importance. The adaption of the method to metallurgical problems allows the obtainment of a correlation between the boron distribution images and the material's microstructure. (M.E.L.).

36730 (CONF-880318—2) Novel magnetic materials research using free electron lasers. Bader, S.D. (Argonne National Lab., IL (USA)). Oct 1987. Contract W-31109-ENG-38. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009989/JAW.

From Topical meeting on free-electron laser applications in the ultraviolet; Cloudcroft, NM, USA (2 Mar 1988).

Synchrotron-radiation sources have dramatically increased the research capabilities of materials scientists. In the following, broad examples of magnetic materials research opportunities are considered. Order-of-magnitude estimates are then given of source flux and spin-polarized signal level for an undulator and an FEL source. The comparison illustrates the impact expected of FEL sources on magnetic materials research in the future. 10 refs.

36731 (CONF-880432—1) Brillouin scattering: its application to the study of damage and amorphization. Grimsditch, M.; Bhadra, R.; Gray, K.; Kampwirth, R.T.; Okamoto, P.; Pearson, J.; Rehn, L. (Argonne National Lab., IL (USA)). Feb 1988. Contract W-31-109-ENG-38. 11p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012053/JAW.

From 8. general conference of the Condensed Matter Division, European Physical Society; Budapest, Hungary (6 Apr 1988).

A brief review of Brillouin scattering is made emphasizing its advantages and disadvantages over conventional ultrasonic techniques. One of its advantages is that the elastic properties of very thin films (~ 1μ) can be investigated. The authors have used this technique to study changes in shear elastic constants of materials irradiated with high energy ions. These particles only penetrate ~ 1μ into the material but produce very high defect concentrations which, in certain cases, can lead to amorphization. In Nb_3Ir and Zr_3Al very large changes are observed before the onset of amorphization, while in Si the changes occur concomitantly with amorphization. The significance of the hardening observed in Zr_3Al when it becomes amorphous will be discussed.

36732 (CONF-880606—3) Thermal conductivity and thermal expansion of stainless steels D9 and HT9. Leibowitz, L.; Blomquist, R.A. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 15p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011973/JAW.

From 10. symposium on thermophysical properties; Gaithersburg, MD, USA (20 Jun 1988).

Renewed interest in the use of metallic fuels in liquid-metal fast breeder reactors has prompted study of the thermodynamic and transport properties of its materials. Two stainless steels are of particular interest because of their good performance under irradiation. These are D9, an austenitic steel, and HT9, a ferritic steel. Thermal conductivity and thermal expansion data for these alloys are of particular interest in assessing in-reactor behavior. Because literature data were inadequate, measurements of these two properties for the two steels were performed and are reported to 1200 K. Of particular interest is the influence on these properties of a phase transition in HT9.

36733 (CONF-880613—9) Modeling studies on the precipitation of Kr after implantation into metals. Rest, J. (Argonne National Lab., IL (USA)). Feb 1988. Contract W-31109-ENG-38. 25p. (CONF-880613—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009987/JAW.

From 14. international symposium on effects of radiation on materials; Andover, MA, USA (27 Jun 1988).

A rate-theory approach is applied to interpreting observations on the precipitation of Kr injected into Ni at temperatures between 25 and 560{degree}C. At temperatures of 400{degree}C or higher, the implanted Kr precipitates evolve into a bi-modal size distribution containing small solid precipitates and an additional population of larger, faceted bubbles. The calculations explore the dependence of the observed bi-modal distribution on the maximum size of the solid Kr precipitates and the effect of this dependence on bubble mobility. The analysis suggests that during the irradiation, whereas the large bubbles move by surface diffusion, the solid Kr precipitates are immobile. The relevance of the Kr-Ni interaction on the solid Kr precipitates size cutoff is discussed. 18 refs., 8 figs., 2 tabs.

36734 (CONF-880613—10) An HVEM study of displacement cascade damage in Nb_3Sn at 13 K. Kirk, M.A.; Baker, M.C.; Kestel, B.J.; Weber, H.W.; Kampwirth, R.T. (Argonne National Lab., IL (USA); Wisconsin Univ., Madison (USA); Atominstitut der Oesterreichischen Universitaeten, Vienna). Feb 1988. Contract W-31109-ENG-38. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009997/JAW.

From 14. international symposium on effects of radiation on materials; Andover, MA, USA (27 Jun 1988).

TEM images of the martensite structure in Nb_3Sn were recorded at various temperatures between 12 and 30{degree}K. The transition to the superconducting state was observed by a slight deflection of the electron beam due to a perturbation of the magnetic field of the objective lens at the sample. The primary interest is in irradiation effects due to fast neutrons from a fusion reactor, and therefore ion irradiation conditions that are somewhat comparable to this were selected. These consisted of 50 keV Xe/sup {plus/} irradiations to simulate neutron produced cascades in a near surface region and 1.5 Mev Kr/sup {plus/} to produce cascade damage through a greater sample thickness. Defect images were obtained as a function of ion dose at 13{degree}K using both fundamental and superlattice dark-field reflections in two-beam conditions. For 50 keV Xe/sup {plus/} irradiations at 13{degree}K the defect yields were quite low at low ion doses where individual defect cascades are well separated. At higher ion doses when significant cascade overlap is present, defect density and contrast became greater than expected. Annealing to room temperature produced a large increase in defect density. Irradiation by 1.5 MeV Kr/sup {plus/} at 15{degree}K removed the martensite structure by an ion dose of 5{times}10^{12}cm/sup {minus/2}. Further irradiation to 3.5{times}10^{13}cm /sup {minus/2} produced evidence for the initial stage of amorphization 24 refs., 3 figs.

36735 (CONF-880613—12) The influence of other microstructural features on void formation and void growth in irradiated materials. Stoller, R.E.; Mansur, L.K. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 46p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010456/JAW.

From 14. international symposium on effects of radiation on materials; Andover, MA, USA (27 Jun 1988).

The chemical rate theory of radiation effects has been used previously to establish that the presence of either residual or transmutant gases is necessary to obtain the void concentrations that are observed in many irradiated materials. In the present work, the rate theory has been used to compare the significance of several microstructure-dependent mechanisms that can influence void formation and growth. Some mechanisms reduce the time required for a gas-stabilized bubble to reach the critical size by either increasing the gas accumulation rate or by reducing the critical number of gas atoms required for void formation. Void growth can be increased by mechanisms that lead to more efficient partitioning of vacancies to the voids. Several of these mechanisms involve the presence of precipitates. The influence of the total precipitate sink strength on the evolution of matrix cavities has also been examined. Other mechanisms included in this comparison are helium collection at network dislocations and solute trapping. Results indicate that a {open+-quotes}favorable{close+-quotes} microstructure can lead to large reductions in the void formation time and increases in the void growth rate. The influence of precipitates is consistent with the experimental observation that the largest voids in irradiated alloys are frequently associated with these particles. Helium and point defect collection are shown to be the most significant precipitate effects. 33 refs., 12 figs.

36736 (CONF-880613—13) Swelling suppression in phosphorous-modified Fe-Cr-Ni alloys during neutron irradiation. Lee, E.H.; Packan, N.H. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 30p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011010/JAW.

From 14. international symposium on effects of radiation on materials; Andover, MA, USA (27 Jun 1988).

Phosphorous-containing austenitic alloys in the solution annealed condition were irradiated at 745--760{degree}K. The alloys were variations on Fe--13Cr--15Ni--0.05P with respective additions of 0.8 Si, 0.2 Ti, or 0.8 Si {plus} 0.2 Ti; also included were low (0.01) and zero P compositions (all values in wt. %). The reference ternary and the two phosphorous-only variations contained little precipitation and numerous voids and swelled rapidly, while the three variants containing P with Si and/or Ti showed little or no void formation and profuse phosphide precipitation. Results indicate that phosphorous in solution alone does not have a major influence on void swelling, whereas fine-scale phosphide precipitation is quite effective at eliminating void formation. The principal mechanism restricting swelling is the effect of the dense precipitate microstructure. These precipitates foster profuse cavity nucleation which in turn dilutes the helium atoms (and more time) in order for individual cavities to surpass their critical size and number of gas atoms necessary for subsequent growth as voids. This mechanism for swelling suppression was not found to be particularly sensitive to moderate variations in either the dislocation or cavity densities; the mechanism is strongest at elevated temperature where the critical quantities are large and is less effective at lower temperatures where the critical quantities are small. 19 refs., 10 figs., 3 tabs.

36737 (CONF-880661—8) A review of solid particle erosion of engineering materials. Majumdar, S.; Sarajedini, A. (Argonne National Lab., IL (USA)). Nov 1987. Contract W-31109-ENG-38. 30p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010065/JAW.

From ASME pressure vessel and piping conference; Pittsburgh, PA, USA (19 Jun 1988).

A detailed modelling effort is currently under way to develop an analytical capability to predict corrosion/erosion behavior of structural materials in advanced fossil technologies. As part of this program, a literature search was conducted to collect the available erosion data on materials of interest in fossil technology and to evaluate the capability of the existing erosion models to correlate the data. Although a significant literature on the review of erosion models already exists, most of these studies concentrate primarily on erosion of pure metals or simple alloys, for which these models were specifically developed. The purpose of the present study is to evaluate the ability of the currently available erosion models to correlate the erosion data on technologically important alloys. The materials of interest are broadly divided into four categories: low alloy steel, high alloy steel, nickel-based superalloy, and cobalt-based superalloy. As expected, the extent of erosion data on the engineering materials is rather limited, particularly at the temperatures of interest. In general, the available data are correlated poorly by the existing models. The poor correlation is mainly due to the variability of the erodent size and hardness, which are not generally accounted for in the models. To a limited extent, the variability of the data also reflects the fact that different alloys are grouped into a single class. The correlation is improved significantly if data are restricted to a limited temperature range and to erodents of similar hardness and of size larger than a critical size. 24 refs., 11 figs., 1 tab.

36738 (CONF-880704—1) Magnetic fluctuations and heavy electron superconductivity. Norman, M.R. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011978/JAW.

From 6. international conference on crystal field effects and heavy fermion physics; Frankfurt, F.R. Germany (18 Jul 1988).

A magnetic fluctuation self-energy based on neutron scattering data is used to calculate mass renormalizations, and superconducting critical temperatures and order parameters, for various heavy electron metals.

36739 (CONF-880705—1) Magnetic excitations in transition metal systems. Cooke, J.F.; Blackman, J.A. (Oak Ridge National Lab., TN (USA); Reading Univ. (UK). Dept. of Physics). May 1988. Contract AC05-84OR21400. 11p. (CONF-880705—). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88011022/JAW.

From International conference on magnetism; Paris, France (25 Jul 1988).

An expression for the neutron scattering cross section based on itinerant electron theory within RPA has been derived which incorporates the most general form of the exchange matrix consistent with crystal symmetry. Numerical results indicate a wider range of spin-wave behavior than found previously.

36740 (CONF-880705—2) Inelastic electron scattering and electron-hole excitations in iron and nickel. Blackman, J.A.; Cooke, J.F. (Oak Ridge National Lab., TN (USA)). Jun 1988. Contract AC05-84OR21400. 12p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011843/JAW.

From International conference on magnetism; Paris, France (25 Jul 1988).

Spin-flip and non-spin-flip mechanisms have been proposed to explain polarization asymmetry in inelastic electron scattering from iron and nickel. A maximum in the asymmetry near 2eV in iron can occur by both mechanisms. The 300meV maximum in nickel is unlikely to occur by non-spin-flip transitions.

36741 (CONF-880724—14) Design of a controlled temperature flue gas corrosion probe. McEvers, J.A.; Federer, J.I. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88007480/JAW.

From 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference; Houston, TX, USA (24 Jul 1988).

The need to determine suitable materials for use in industrial waste heat recovery systems requires assessment of materials degradation in various flue gas environments. Such an assessment generally involves exposing candidate materials to the environments, then analyzing the effects of the exposure conditions. Degradation of materials is related to flue gas chemical composition, temperature, and thermal cycling behavior. Temperature variations, especially atypical thermal cycling, complicate the task of characterizing such phenomena as corrosion rates and corrosion mechanisms. A relatively constant temperature would allow a more accurate determination of the effects of flue gas chemical composition and temperature. In response to this need, a flue gas corrosion probe has been designed for exposure tests of materials. The probe allows materials to be tested at nominally constant temperatures within a wide span of either constant or changing flue gas temperatures. This paper describes the design and fabrication of the corrosion probe system. 9 refs., 4 figs., 6 tabs.

36742 (CONF-8704190—3) Influence of the interface on the crystallization of amorphous Ge in Pb/Ge multilayers. Sevenhans, W.; Locquet, J.P.; Bruynseraede, Y.; Homma, H.; Schuller, I.K. (Argonne National Lab., IL (USA)). Jan 1988. Contract W-31109-ENG-38. 17p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010072/JAW.

From 7. general conference of the Condensed Matter Division of the European Physical Society; Pisa, Italy (7 Apr 1987).

The amorphous to crystalline phase transition of Ge in contact with Pb has been extensively investigated in Pb/Ge multilayers. We find that the Ge crystallizes at reduced temperatures in the range of 100-200{degree}C depending on the thickness of the Ge and the Pb. Simultaneously the texture of the Pb improves and the layered structure completely disappears. The basis for the reduction of the crystallization temperature is the enhanced diffusion kinetics at the interface, caused by the adjacent Pb layer. 20 refs., 4 figs.

36743 (CONF-8706295—1) Irradiation creep and embrittlement behavior of AISI 316 stainless steel at very high neutron fluences. Porter, D.L.; Garner, F.A. (Argonne National Lab., IL (USA); Pacific Northwest Lab., Richland, WA (USA)). Feb 1988. Contract W-31109-ENG-38. 19p. (CONF-8706295—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009949/JAW.

From International workshop on mechanisms of irradiation creep at very high neutron fluences; Hecla Island, Canada (15 Jun 1987).

The irradiation-induced creep and swelling of AISI 316 stainless steel have been investigated at two temperatures (400 and 550{degree}C) to very high neutron fluences. It is shown that creep and swelling can be considered as interactive phenomena with several stages of creep related to the total amount of accumulated swelling. The final stage involves the apparent cessation of creep and has been observed only at the higher irradiation temperature. The development of a coincident and severe ex-reactor embrittlement problem after irradiation at 400{degree}C appears also to be separately related to the development of substantial swelling. This latter phenomenon was not observed at 550{degree}C. The mechanisms thought to be possibly responsible for each of these two phenomena are discussed in detail. 29 refs., 9 figs.

36744 (CONF-8803104—1) Electronic structure of Zintl phase compounds by nonlinear optimization. Woodward, C.; Benedek, R.; Min, B.I. (Argonne National Lab., IL (USA)). Mar 1988. Contract W-31109-ENG-38. 12p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009998/JAW.

From Sanibel symposium on atomic, molecular and condensed matter theory; Gainesville, FL, USA (12 Mar 1988).

Since the introduction of dynamical simulated annealing (DSA) by Car and Parrinello in 1985, there has been growing interest in the use of nonlinear optimization to perform electronic structure calculations. We review here the complementary method of steepest descents (SD), a first-order treatment designed for local

optimization. Modifications are discussed to adapt SD to a supercell treatment of metallic systems using a plane wave basis. An application to the Zintl phase compound NaTl is presented. The application of separable nonlocal pseudopotentials to improve this momentum space formalism is discussed. 18 refs., 1 fig.

36745 **(CONF-8803114—1) Electrodeposition of cadmium from aqueous fluoroborate electrolytes.** Varma, R.; Shimotake, H.; Hoeller, T.L.; Agarwala, V. (Argonne National Lab., IL (USA); Amoco Research Center, Naperville, IL (USA); Wisconsin Univ., Madison (USA). Materials Science Center). 1988. Contract W-31-109-ENG-38. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012042/JAW.

From Corrosion '88; Houston, TX, USA (21 Mar 1988).

A new method of electroplating cadmium on high-strength steel from aqueous fluoroborate electrolytes has been developed at Argonne National Laboratory. The cadmium coatings are fine grained, coherent, and strongly adherent to the substrate. With this method, a high-rate electrodeposition is achieved in an electrolyte-flow cell using an optimized pulse-nucleation step followed by deposit growth under a DC or pulsed current. This method results in minimal hydrogen codeposition during plating, which can lead to steel embrittlement.

36746 **(CONF-8804112—2) A new model for the simulation of interfaces at high temperature.** Lutsko, J.F.; Nguyen, T.; Phillpot, S.R.; Wolf, D.; Yip, S. (Argonne National Lab., IL (USA); Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Apr 1988. Contract W-31-109-ENG-38. 5p. (CONF-8804112—). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88009926/JAW.

From Interfacial structure, properties and designs in solids; Reno, NV, USA (5 Apr 1988).

A new method for the molecular dynamics simulation of bulk planar interfaces at high temperatures is presented. The method uses the basic Parrinallo-Rahman (constant stress) scheme modified, however, for the application to inhomogeneous systems. Since our computational cell contains only one interface with 2-d periodic boundary conditions we are able to study isolated interfaces all the way up to melting. The interaction between boundaries which may lead to their annihilation at higher temperatures, which is a problem when 3-d periodic boundaries are applied, is thus avoided. As an application, the method is used to study the stability of a grain boundary at high temperatures. Observations on a possible connection between grain boundary migration and "premelting" are discussed. 5 refs., 15 figs.

36747 **(CONF-8804112—5) Controlling phase formation and stability to improve the high temperature creep resistance of austenitic stainless steels.** Maziasz, P.J. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011401/JAW.

From Interfacial structure, properties and designs in solids; Reno, NV, USA (5 Apr 1988).

New Fe-14Cr-16Ni-2.5Mo-2Mn steels modified with carefully controlled additions of Ti, Nb, V, C, P and B have been developed which have outstanding creep rupture resistance at 700{degree}C and 170 MPa, much better than comparable commercial steels. The minor alloying element levels and combinations were chosen a priori to produce specific microstructures of fine MC and FeTiP precipitates in the matrix and coarser carbides ($M_{23}C_6$, M_6C and MC) along grain boundaries before creep properties were ever measured. The precipitates directly produce the creep resistance observed in the new steels. The ideas that guided these modifications to tailor and control the precipitate microstructure stem from years of studying precipitation in aged and reactor irradiated steels by the use of analytical electron microscopy (AEM). 14 refs., 5 figs., 1 tab.

36748 **(CONF-8804124—1) Fluid flow modeling in casting processes and its implications.** Sha, W.T. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 17p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010009/JAW.

From Modeling control of casting and welding processes conference; Palm Coast, FL, USA (17 Apr 1988).

In recent years, mathematical modeling of casting processes has received increasing attention; however, very little work has been done on modeling of fluid flow of liquid melt. This paper discusses some important aspects and implications of fluid flow modeling pertinent to casting processes. The recent advances and projected progress of computer technology and numerical analysis have made is possible to begin to perform realistic simulations of the casting process in general and to model fluid flow of liquid melt in particular. Topics to be discussed include the (1) desirability of a computer system specifically for casting modeling, (2) need for efficient solution technique for fluid flow and user-friendly pre- and post-processors or user-interface package, and (3) development of both realistic constitutive relations and reliable material properties pertinent to castings. Fluid flow of liquid melt plays an important role in the design of the feed system and mold, solidification rate and pattern, gas entrainment, and segragation of alloy elements. 29 refs., 2 figs.

36749 **(CONF-8805134—2) Use of Moessbauer spectroscopy to study implanted surfaces.** McHargue, C.J. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010452/JAW.

From Ion implantation and plasma assisted processes for industrial applications conference; Atlanta, GA, USA (21 May 1988).

The technique of Moessbauer spectroscopy in which the conversion electrons emitted during the decay of an excited nucleus are measured in the backscattered geometry is particularly useful for the study of ion implanted materials. The technique is nondestructive and probes a depth comparable to the ion range for most implantation conditions. The hyperfine structure of the Moessbauer spectra gives three important parameters: the isomer shift, the quadrupole splitting, and the magnetic hyperfine splitting. The analysis of these parameters provides information on the electronic structure and local symmetry of the implanted ion. Examples will be given for the use of conversion electron Moessbauer spectroscopy (CEMS) to study implanted metals and ceramics. 14 refs., 6 figs.

36750 **(CONF-8805141—1) Evaluation of fracture models through pressurized-thermal-shock testing.** Pugh, C.E.; Bryan, R.H.; Bass, B.R.; Nanstad, R.K. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 25p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011834/JAW.

From IAEA specialists' meeting on fracture mechanics verification by large-scale testing; Stuttgart, F.R. Germany (25 May 1988).

Two multiple-transient pressurized-thermal-shock experiments (PTSEs) have been conducted under the NRC-sponsored Heavy-Section Steel Technology (HSST) program. The first test (PTSE-1) employed an SA-508 class 2 steel with high Charpy upper-shelf energy level and a relatively high brittle-to-ductile transition temperature. The second test (PTSE-2) used a 2 1/4 Cr-1 Mo steel (SA-387 grade 22) that had been given a special heat treatment to yield a low Charpy upper-shelf energy level and attendant low tearing resistance. Each experiment included two combined thermal and pressure transients that give rise to propagation and arrest of an initial long flaw that extended about 10% through the thick wall of the test cylinder. Both materials exhibited the ability to inhibit crack propagation by warm prestressing, high initiation toughness values and high crack-arrest toughness values. Cleavage initiation and arrest are modeled well by available fracture theories. However, calculations of ductile tearing based on resistance curves did not consistently predict the observed tearing.

36751 **(DOE/ER/02390—T2) Basic research in crystalline and noncrystalline ceramic systems: Annual report for the period December 1, 1983 to November 30, 1984.** (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Materials Science and Engineering). 1984. Contract AC02-76ER02390. 318p. NTIS, PC A14;3. Order Number DE88011578/JAW.

The basic research program in crystalline and noncrystalline ceramic systems sponsored by the US Department of Energy sup-

ports a significant fraction of the research effort and graduate student training in ceramics at MIT. During the past year kinetic and equilibrium studies related to grain boundary segregation and grain boundary properties in a variety of materials including structural ceramics such as silicon carbide and aluminum oxide have been completed. Another significant area of study has been related to sintering behavior and grain growth in structural and other ceramics. Included in this report are the following: electrical and optical properties, grain boundary mobility, sintering, diffusion, defects, quenching of solid samples for high temperature equilibrium measurement, and suppression of insulator charging during SIMS and SEMS measurements. 227 refs., 113 figs., 23 tabs.

36752 **(DOE/ER/45138—T2) Corrosion fatigue of small cracks: Mechanics and chemistry: Final technical progress report, July 1, 1984-October 31, 1987.** Wei, R.P. (Lehigh Univ., Bethlehem, PA (USA). Dept. of Mechanical Engineering and Mechanics). 7 Mar 1988. Contract FG02-84ER45138. 10p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88007955/JAW.

The principal contributions of this study have been briefly summarized. Firstly, electrochemical reaction control of corrosion fatigue crack growth in ferrous alloys was demonstrated. The controlling reactions are those involving equilibration of the crack-tip bare surfaces with its neighboring filmed or oxidized surfaces. Secondly, the electrolyte within the crack serves as a high resistance path that separates the crack tip region from the bulk (external) environment. Because of this high resistance, the crack tip region is effectively shielded and the reactions are affected little by the externally imposed conditions, with the crack-tip potential tending to remain very near the free corrosion potential. Thirdly, with increases in test temperature, it becomes increasingly difficult to displace the crack-tip potential away from the free corrosion potential. In other words, because of the increased reaction rate at higher temperatures, larger currents must be imposed to maintain the surface at a prescribed potential. The increased currents, however, result in greater potential drop along the crack, and thereby reduces the change in potential at the crack tip under a fixed applied potential. The details of electrochemical conditions and of the mechanisms of reactions, however, are much more complex, and would require further study. Fourthly, the results provide further support for hydrogen embrittlement as the mechanism for crack growth enhancement for the austenitic stainless and the carbon strengthened steels. Lastly, the role of grain boundaries in influencing short-crack growth response has be elucidated.

36753 **(DOE/ER/45154—T3) Nucleation and growth of solid-state transformations: Progress report, August 1, 1987{endash}July 31, 1988.** Olson, G.B.; Parks, D.M. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Materials Science and Engineering). 1988. Contract FG02-84ER45154. 4p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009887/JAW.

Research is being done on transformation plasticity in steels. A model for the kinetics of strain-induced transformation of dispersed austenite, using data for the martensitic transformation of iron particles precipitated in a copper matrix, has been developed. Also completed was a study of strain-induced transformation kinetics, transformation plasticity and toughening in phosphocarbide-strenghtened austenitic steels. A model for strain induced transformation in finite element calculations has been implemented. (CBS)

36754 **(DOE/ER/45211—4) Grain boundary structure in Ni_3Al.** Mackenzie, R.A.D.; Vaudin, M.D.; Sass, S.L. (Cornell Univ., Ithaca, NY (USA). Dept. of Materials Science and Engineering). Jul 1987. Contract FG02-85ER45211. 7p. (CONF-870793—7; MSC—6186). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88009164/JAW.

From Conference on interface science and engineering; Lake Placid, NY, USA (12 Jul 1987).

The influence of boron segregation and non-stochiometry on grain boundary structure in Ni_3Al was studied by transmission and scanning electron microscopy techniques. Small angle twist and tilt boundaries were produced by hot pressing misoriented single crystals of both doped and undoped materials. Dislocation structures were observed in both bicrystal and polycrystal grain boundaries. In most cases the grain boundary dislocations were found to have the expected a<100> Burgers vector, however, in one case dislocations with Burgers vector a2<110> dislocations have been observed. Using a SEM diffraction technique the frequency of occurrence of grain boundary types was examined and found to be unchanged by the addition of boron. 12 refs., 4 figs.

36755 **(DOE/ER/45211—6) The influence of solute segregation on the dislocation structure of small and large angle [001] twist boundaries in Fe-Sb alloys.** Lin, C.H.; Sass, S.L. (Cornell Univ., Ithaca, NY (USA). Dept. of Materials Science and Engineering). Feb 1988. Contract FG02-85ER45211. 7p. (MSC—6357). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88009166/JAW.

The dislocation structure of small and large angle [001] twist boundaries in Fe{endash}Sb alloys is influenced by the segregation of Sb to the vicinity of the interface. Since changes in the dislocation structure of [001] twist boundaries due to solute segregation have now been observed in the Fe{endash}Au and Fe{endash}Sb systems, this behavior is believed to represent a generally occurring phenomenon in Fe alloys. 18 refs., 3 figs.

36756 **(DOE/ER/45211—8) High resolution detection of solute segregation to the cores of dislocations in grain boundaries.** Michael, J.R.; Lin, C.H.; Sass, S.L. (Bethlehem Steel Corp., PA (USA). Homer Research Lab.; Cornell Univ., Ithaca, NY (USA). Dept. of Materials Science and Engineering). Mar 1988. Contract FG02-85ER45211. 5p. (MSC—6391). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88009168/JAW.

Thin film Fe–0.8 at. % Au bicrystals, {approximately}60 nm thick, containing [001] twist boundaries were prepared. The average compositon of the bicrystal was determined by Rutherford backscattering spectroscopy (RBS), which also showed that the Au was nonuniformly distributed along the direction normal to the interface, with a large amount concentrated at the [001] twist boundary. This observation constitutes direct evidence that the Au is segregated to the vicinity of the grain boundary. The Au distribution within the plane of the interface was analyzed in a Vacuum Generators HB-501 scanning transmission electron microscope (STEM) equipped with a field emission electron source and a Link Analytical windowless x-ray detector. The boundary plane was oriented perpendicular to the electron beam. Digital line scans were performed across the dislocation network. Au segregates extensively to the cores of the <100>-type dislocations in small angle [001] twist boundaries in Fe–Au alloys. Our observations demonstrate that the <110> network is favored in pure Fe, which leads to the suggestion that the dislocation core energy plays an important role in determining the stable boundary structure.

36757 **(DOE/ER/45211—9) Grain boundary characterization in Ni_3Al.** Mackenzie, R.A.D.; Vaudin, M.D.; Sass, S.L. (Cornell Univ., Ithaca, NY (USA). Dept. of Materials Science and Engineering). Mar 1988. Contract FG02-85ER45211. 7p. (CONF-8804112—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009169/JAW.

From Interfacial structure, properties and designs in solids; Reno, NV, USA (5 Apr 1988).

Grain boundaries in both pure and boron doped Ni_3Al have been studied using a variety of electron microscopy techniques. Small angle boundary structures were examined in both bicrystal and polycrystalline specimens. Dislocaions with Burgers vector a2<110> are observed in the presence of boron, while dislocations with Burger vector a<100> are observed in the absence of boron. A possible explanation for this behavior is the presence of a disordered layer at the interface in boron-doped Ni_3Al. The addition of boron to Ni_3Al was seen to induce faceting of grain boundaries, and to afford the boundaries some protection from etching. Using electron backscatter diffraction patterns, the frequency of occurrence of grain boundary types was found to be unchanged by the addition of boron.

36758 (DOE/ER/45213—3) Microchemical analysis of polycrystalline Ni_3Al and other ordered alloys using the field-ion microscope atom probe: Technical progress report. Brenner, S.S. (Pittsburgh Univ., PA (USA). Dept. of Materials Science and Engineering). 31 May 1988. Contract FG02-85ER45213. 15p. NTIS, PC A03;3. Order Number DE88011519/JAW.

We have used the field-ion microscope atom probe to detect chemical changes that occur at the grain-boundaries of nickel aluminide as a result of the boron additions. We have also examined the matrix of boron-doped hyperstoichiometric nickel aluminide to determine whether boron clustering could be responsible for the lack of response of these alloys to boron ductillization. Finally, we have measured the site occupation probability of hafnium and tantalum in nickel aluminide using the atom probe's atomic layer-by-layer analysis capability. The site occupation results are useful in understanding the solid solution strengthening effect in nickel aluminide. The results of our expermental program are briefly described. 17 refs., 5 figs., 1 tab.

36759 (DOE/ER/45214—T1) Twin boundaries and heterophase interfaces in ferroelastic martensites. Annual progress report No. 3, January 16, 1986-June 30, 1988. Barsch, G.R. (Pennsylvania State Univ., University Park (USA). Materials Research Lab.). 1988. Contract FG02-85ER45214. 11p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011894/JAW.

A comprehensive theoretical study with concurrent supporting experimental investigations is being carried out on coherent and semicoherent interfaces in ferroelastic martensites, including twin boundaries and twin bands, heterophase parent/product interfaces and inclusions, and transformation precursors. This work is motivated by the need for a new theoretical basis for investigating the martensite nucleation mechanism and for establishing the conditions for nonclassical nucleation. Soliton-like solutions of a dynamic Ginzburg-Landau continuum theory for ferroelastic martensites are being studied in order to determine the strain distribution, strain energy and dynamical behavior for various geometric configurations as a function of the material parameters, temperature and boundary conditions. Model parameters of the theory consist of the second and higher order elastic constants and the harmonic strain gradient coefficients in the parent phase. X-ray measurements of the transformation strain versus temperature, and simultaneous ultrasonic velocity and attenuation measurements on biaxially stressed crystals in In/sub 1-x/Tl/sub x/ alloys for determining the second and higher order elastic constants in the single domain tetragonal state and for studying the morphology and the dynamic behavior of the martensite interfaces and transformation precursors have been started or are in preparation, respectively.

36760 (DOE/ER/45281—2) Investigation of magnetic anisotropy and spin wave modes in transition metal multilayers: Technical progress report, August 1987 through July 1988. Pechan, M.J. (Miami Univ., Oxford, OH (USA)). 1988. Contract FG02-86ER45281. 7p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88009007/JAW.

The magnetic properties of compositionally modulated structures known as superlattices or multilayers are of considerable interest because of their application to magnetic recording technology and because of the insight provided into the fundamental nature of magnetism. Anisotropic properties are of vital import in developing stable, well defined, high density magnetic domains in both flux and optically detected magnetic recording media. Spin wave investigations on the other hand, provide insight into the fundamental nature of surface spin states and interior spin dynamics. Measurements on CuNi and MoNi indicate a very large degree of magnetic anisotropy, which seems to be frequency dependent. The sources of the anisotropy have not been fully explained and the reason for the frequency dependence remains unknown. The FMR measurements on these systems all show definite structure in the perpendicular spectra, but spin wave analysis of this structure has not been reported. It is reasonable to assume that the source of the anisotropy, its frequency dependence and the perpendicular FMR structure are intimately related. Work is being continued on high T/sub c/ oxide superconductors.

36761 (DOE/ER/45310—8) Grain boundaries: Annual technical progress report. Balluffi, R.W.; Bristowe, P.D. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Materials Science and Engineering). 28 Apr 1988. Contract FG02-87ER45310. 10p. NTIS, PC A02;3. Order Number DE88009889/JAW.

The present document is a progress report describing the work accomplished on the study of grain of gold. The research that was proposed initially for this period consisted of studies of the atomistics structure of grain boundaries by means of combined x-ray diffraction and computer modeling and of grain boundary phase transitions by electron microscopy and computer modeling. Progress has been made on both of these areas which is described in more detail. A list of reports describing the research completely during the first year is presented.

36762 (DOE/ER/45311—T1) The structure and properties of grain boundaries in B2 ordered alloys. Baker, I. (Dartmouth Coll., Hanover, NH (USA). Thayer School of Engineering). 4 Apr 1988. Contract FG02-87ER45311. 14p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009890/JAW.

During this period we have produced fine-grained alloys of FeAl and NiAl which span the respective phase fields of these materials. We have: (1) initiated mechanical testing of the FeAl alloys as a function of grain size, which confirms that the yield strength decreases with increasing deviation from stoichiometry; (2) initiated grain growth studies of the FeAl alloys, whose preliminary results suggest that grain growth is more rapid in off-stoichiometric compositions; (3) successfully prepared thin foils of NiAl alloys and iron-rich FeAl alloys for transmission electron microscopy; (4) initiated an Atom Probe Field Ion Microscope study of the grain boundary chemistry of NiAl; (5) attempted to study boundary chemistry in NiAl and studied grain boundary chemistry in Ni_3Al using Auger electron spectroscopy; and (6) performed a short oxidation study of FeAl, which shows that oxidation rate increases with increasing iron content in FeAl. 3 refs., 2 figs., 3 tabs.

36763 (DOE/NASA/16310—6) Characterization of precipitates in a niobium-zirconium-carbon alloy. Grobstein, T. L.; Titran, R. H. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1986. Contract AI03-86SF16310. 15p. (CONF-861076—9; NASA-TM—100848; CONF-861076—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011534/JAW.

From Fall meeting of the Metallurgical Society of AIME; Orlando, FL, USA (5 Oct 1986).

A niobium alloy with 1 percent zirconium and 0.063 percent carbon by weight was investigated in the as-rolled and annealed conditions, and after high-temperature (1350 and 1400 K) exposure with and without an applied stress. In the as-rolled and in the annealed conditions, large metastable carbides were observed in addition to a regular distribution of small particles. During the high-temperature exposure, the majority of the large carbides were dissolved and a more stable carbide phase formed. This finely dispersed phase had a composition determined to be {approximately}70 percent ZrC and {approximately}30 percent NbC and showed some evidence of an orientation relationship with the matrix. The precipitates appeared to coarsen slightly after {approximately}5000 hr exposure at temperatures between 1350 and 1400 K. This same high-temperature exposure in the presence of an applied stress resulted in a decrease in the size and in the interparticle spacing of the stable precipitates. However, the composition of the precipitate phase and its ability to pin dislocations were not affected by the temperature or stress conditions.

36764 (EPRI-CS—5695) On-line corrosion monitoring in cathodically protected systems: Final report. McKubre, M.C.H. (SRI International, Menlo Park, CA (USA)). May 1988. 324p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011531/JAW.

This report describes the development of a novel method for the determination of corrosion parameters and for calculating corrosion rates in cathodically protected systems. This method, called harmonic impedance spectroscopy, employs a medium amplitude si-

nusoidal current or voltage perturbation sufficient to drive the current/voltage response of the corroding electrode into nonlinearity.

36765 (ETSU-WN—5085-P1) Cumulative damage of welded joints: a literature survey of the influence of stress magnitude on the value of Σ{sub(N)}{sup(n)}. Final report. Gurney, T.R. (Welding Inst., Cambridge (UK); UKAEA Harwell Lab. Energy Technology Div.). Jul 1987. 64p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ. Order Number TI88102090/JAW.

The great majority of structures and components which are at risk from fatigue failure, including wind turbines, are subjected to stresses of variable amplitude. On the other hand, most fatigue test results have been obtained under conditions of constant amplitude loading, and it is those results which have been used to derive fatigue design rules for welded joints. Thus, in order to design a structure for variable amplitude loading, use is normally made of Miner's linear damage rule. However, the evidence suggests that Miner's rule may be unsafe if the loading involves relatively frequent applications of the peak stress. It was also found that the values of Σsub(N)sup(n) (where n is the number of stress cycles and N the corresponding number of cycles to failure) appeared to be dependent upon the magnitudes of the applied stresses. On the basis of that finding that it was proposed that this survey should be carried out, with the object of determining whether or not the finding could be confirmed. The results of the survey are given.

36766 (ETSU-WN—5085-P2) Summary of constant amplitude fatigue test data for welded joints at long endurances. Final report. Gurney, T.R. (Welding Inst., Cambridge (UK); UKAEA Harwell Lab. Energy Technology Div.). Jul 1987. 41p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ. Order Number TI88102091/JAW.

Existing fatigue design rules are not necessarily safe for the welded joints of wind turbine generators where very long endurances in the region of 10^8 - 10^9 cycles can be expected. Fatigue test data for welded joints at long endurances have been compiled, therefore, with a view to determining the fatigue limits more accurately. The results of the survey are presented.

36767 (ETSU-WN—5085-P3) Influence of a salt spray environment on the fatigue strength of welded joints (literature survey). Final report. Gurney, T.G. (Welding Inst., Cambridge (UK); UKAEA Harwell Lab. Energy Technology Div.). Sep 1987. 18p. British Lending Library Document Supply Centre, Boston Spa, Wetherby, West Yorks. LS23 7BQ. Order Number TI88102092/JAW.

Wind turbine generators are likely to be sited either offshore or in coastal locations and will be subjected therefore to intermittent salt water spray. In the event of the breakdown of corrosion protection coatings on critical parts of the structure, such as the welded steel blades, the fatigue strength may be reduced. In view of the fact that existing design standards and guidelines do not address this situation, data has been compiled on the influence of salt spray (or similar) on the fatigue strength of welded joints in structural steels and is summarized in this report.

36768 (FRCEA-TH—56) Study of interaction of fatigue damage and ratcheting. Effect of a tensile primary load on torsion fatigue resistance of stainless steel 304 L at ambient temperature. Hakem, N.S. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques; Paris-6 Univ., 75 (France)). 29 Sep 1987. 228p. (In French). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88752578/JAW.

Effect of ratcheting on fatigue resistance of a stainless steel 304 L, used for reactor vessels, is studied experimentally. Lifetime of samples is reduced if a static constant tensile load (primary loading) is superimposed to cyclic torsion deformations (secondary loading). An equivalent deformation concept is developed to express a criterion of fatigue rupture under primary loading. No effect is noted on the curve of cyclic strain hardening. This fatigue analysis gives no information on cumulated axial deformation. Progressive elongation, observed during testing, is dependent of primary and secondary loading. Rupture is produced by fatigue because cumulated axial deformation is limited (<4%) and lifetime is independent of cumulated axial deformation. Results show that for more than 10/sub 4/ cycles at rupture cumulated deformation is <0.5% and below 5000 cycles deformation is ≧ 1%. Two domains are evidenced: one where ruin is obtained by fatigue and in the other one by ratcheting. In this last domain cumulated deformation is higher than 0.5%, 1% value admitted by ASME codes. 103 refs.

36769 (GKSS—87/E/30) Determination of elastic-plastic fracture toughness parameters, with particular regard to the activities of the EGF. Schwalbe, K.H.; Neale, B.K.; Ingham, T. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.); GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.); Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). 1987. 27p. (In German). (CONF-8703268—). GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.).

From 19. meeting of the Technical committee on Fractures of Deutscher Verband fuer materialpruefung e.V.: fracture mechanics of welded joints; Freiburg im Breisgau, F.R. Germany (16 Mar 1987).

The progress made in the field of non-linear fracture mechanical testing, and the experience gained so far with existing testing methods and standards have induced the European Group on Fracture (EGF), to establish a Task Group for screening and compiling the European knowledge and experience for setting up a standard procedure for non-linear fracture mechanics testing. The work accomplished so far by the Task Group is explained against the background of existing methods.

36770 (INIS-BR—969) Kinetic of martensitic transformations induced by hydrogen in the austenite. Oliveira, Sergio P. de; Saavedra, A.; Miranda, P.E.V. de. (Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro). 1986. 19p. (In Portuguese). (CONF-8610317—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701623/JAW.

From 4. Brazilian symposium on piping and pressure vessels; Salvador, BA, Brazil (28 Oct 1986).

The X-ray diffractometry technique was used, with an automatic data acquisition system to determine the kinetics of hydrogen induced martensitic phase transformations in an AISI 304 austenitic stainless steel type, used in nuclear power plants. Hydrogenation was performed cathodically in a 1N sulfuric acid solution, containing 100 mgl of arsenic trioxide, at 50°C, during 2 hours and with a current density of 200 Am^2. It was found that the microstructure of the steel plays a role on the generation of hydrogen induced martensitic phases and surface micro cracks. Both kinetics were slower on a pre-cold rolled steel.

36771 (INIS-BR—1017) Construction and fabrication of a hot X-ray diffraction chamber for studying the reaction between Nb-Ti and N_2. Teixeira, Silvio R.; Rodrigues, J.A.; Mascarenhas, Y.P. (UNESP, Presidente Prudente (Brazil). Dept. de Ciencias Ambientais). 1986. 5p. (In Portuguese). (CONF-8609421—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702762/JAW.

From Meeting about gases in metals and alloys; Sao Carlos, Brazil (24 Sep 1986).

An high temperature chamber for the X-ray diffraction of UNESP-Presidente Prudente, in Brazil, to study the reaction between the Nb-Ti alloy and the nitrogen gas, was constructed. The phases formed during the reaction are identified, the alterations of lattice parameters during the formation of metal-gas solid solution solution are observed, and information on Kinetic and the advance of nitridation from the surface to the interior of these sample. (M.C.K.).

From 5. meeting of physicists from northeast; Natal, Brazil (12 Nov 1987).

36773 (INIS-BR—1024) **Weldability study of the structural steel of the Angra II reactor containment.** Santos Pinto, M. dos. (Rio de Janeiro Univ. (Brazil). Coordenacao dos Programas de Pos-graduacao de Engenharia). 1980. 81p. (In Portuguese). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702289/JAW.

A weldability study of the german steel WSTE-51 based on mechanical, metallographic, hardness as well as special tests such as the CTS, the Tekken, for cold cracking, and the Vinckier test for reheat cracking is presented. The welding process used was the manual metal arc with low hydrogen eletrodes. In order to broaden the scope of this study the properties of weldments fabricated by submerged arc welding with high and low heat input were analized by means of mechanical and metallographic tests. The results showed that the joints had good quality and emphasize the necessity of special care in order to avoid cold cracking as well as the use of a temperbead in order to avoid reheat cracking. The submerged arc welding study concludes that higher impact resistance in the HAZ is obtained with low heat imput.

36774 (INIS-BR—1072) **Influence of martensitic phase in abrasion behaviour of stainless steel 304 L.** Ruzzante, J.; Alvarez, P.; Hey, A.; Gestido, G.D.; Vosen, J.H.; Fernandez, H.A. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina)). 1986. 19p. (In Spanish). (CONF-8611238—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702770/JAW.

From 41. annual congress of the Brazilian Association of Metals; Sao Paulo, Brazil (9 Nov 1986).

Abrasion behaviour is studied in commercial stainless steels of different class compositions by standard. The work achieved guieds in structural analysis of superficial coat formed and its relation with abrasion variables, load and velocity. The abrasion is made in an equipment LF WK of high velocity with friction powers, abrasion velocity and temperature variation registered on the tested piece. The abrasion zone is studied with scanning electron microscope (SEM). The deformed superficial zone nature is studied relationing its microstructure with profile corresponding of microhardness. (C.M.C.T.R.).

36775 (INIS-BR—1102) **Preparation and testing of Nb-Zr and Nb-ZrO^2 single crystals for deformation studies.** Botta Filho, W.J.; Christian, J.W.; Taylor, G. (Sao Carlos Univ. (Brazil). Dept. de Engenharia de Materiais). 1987. 16p. (CONF-8710277—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702798/JAW.

From 42. annual congress of the Brazilian Association of Metals; Salvador, Brazil (18 Oct 1987).

The difficulties to obtain adequate single crystals of Nb-Zr and Nb-ZrO_2 alloys for deformation studies are discussed. Low-temperature internal oxidation of Nb-Zr alloys followed by ageing at higher temperatures resulted in the precipitation of ZrO_2 particles. However, the effect of this treatment on the particles size and distribution and on the crystallographic structure of the particle was not completely understood. Compression tests in the temperature range 4.2K to 373K showed a small effect of zirconia particles on the mechanical properties of Nb-Zr solid solutions and a significative effect of the amount of oxygen remaining in solid solution after the oxidation treatment.

36776 (INIS-BR—1103) **Microsegregation and homogenization in U-Nb alloy.** Leal, J. Fernando; Nogueira, R.A.; Ambrozio Filho, F. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)). 1987. 19p. (In Portuguese). (CONF-8710277—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702799/JAW.

From 42. annual congress of the Brazilian Association of Metals; Salvador, Brazil (18 Oct 1987).

Microsegregation results in U-4 w t% Nb alloys casted in nonconsumable electrode arc furnace are presented. The microsegregation is studied qualitatively by optical microscopy and quantitatively by electron microprobe. The degreee of homogenetization has been measured after 800°C heat treatments. The times required for homogeneization of the alloys are also discussed.

36777 (INIS-mf—11718) **Magnetic properties of heavy-fermion superconductors.** Rauchschwalbe, U. (Technische Hochschule Darmstadt (Germany, F.R.). Fachbereich 5 - Physik). 5 Dec 1986. 197p. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number DE88753554/JAW.

In the present thesis the magnetic properties of heavy-fermion superconductors are investigated. The magnetoresistance and the critical magnetic fields show a variety of anomalous phenomena. The Kondo lattices $CeCu_2Si$ and $CeAl_3$ are analysed by magnetoresistance and the field dependence of the resistivitis of UBe_{13}, UPt_3, URu_2Si_2 and $CeRu_2Si$ are measured for temperatures < or approx. 1 K. (BHO).

36778 (JINR—14-87-30) **Results and perspectives of investgtigations at the accelerators in LNR of JINR of high-energy ion irradiation influence on structure, deformational and strength metal and crystal properties.** Regel', V.R.; Vorob'ev, E.D.; Didyk, A.Yu.; Skuratov, V.A.; Shchegolev, V.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1987. 15p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702128/JAW.

The review on radiation material test in LNR of JINR at heavy ion accelerators are given. The description of experimental methods, which can permit to study different material properties at heavy ion irradiation is presented. The results on different crystals, metals and alloy investigations, irradiated by ions with energies from 1 to 10 MeV/nucleon are considered. 24 refs.; 8 figs.

36779 (JINR—R-13-87-525) **Investigation of hydrogen isotope penetration through stainless steels Kh18N10T and Kh13M2BFR.** Bystritskij, V.M.; Dzhelepov, V.P.; Granovskij, V.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1987. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702189/JAW.

Submitted to the journal At. Energy.

Compared are the parameters of hydrogen and deuterium penetration through austenitic (Kh18N10T) and ferritic-martensitic (Kh13M2BFR) steels measured at high saturation and at the gas pressure to 5000 at in the temperature range 300-1050 K. The conclusion is made that the given steels can be applied as materials for pressure vessels only in pressure range investigated. 5 refs.; 7 figs.; 2 tabs.

36780 (JINR-E—8-87-577) **Low temperature long-time relaxation in glasses.** Sahling, S.; Sahling, A.; Kolac, M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1987. 7p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702914/JAW.

Submitted to the journal J. Solid State Comm. .

The analysis of low-temperature long-time heat release experiments for amorphous materials (SiO_2, $Fe_{80}B_{14}Si_{16}$; $Co_{82}Fe$/sub 4.5/Cr_2Si/sub 2.5/$B_2$2) at temperatures above 1K is presented. The essential deviations from the tunneling theory in this temperature range can be explained by the assumption of maximum energy E/sub f/ which limits the energy distribution of tunneling states and the height of potential barriers. E/sub f/ is only slightly material dependent (7.5K ≦ E/sub f/ ≦ 24K). The results are consistent with the theory of soft potentials. 16 refs.; 2 figs.; 1 tab.

36781 (JINR-R—17-87-187) Heat capacity of a thick superconducting plate with proximity effect. Ivanov, N.B.; Mishonov, T.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 4p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702947/JAW.

Submitted to the journal Phys. Status Solidi B.

It is shown that within the framework of the Ginzburg-Landau theory the plane defects may smear the superconducting phase transition in manner similar to the smearing connected with the thermal fluctuations in disordered systems. If defects stimulate the appearance of a coherent phase at T > T/sub c/, the heat capacity formula C/sub s/-C/sub n/=constxchemical bondT-T/sub c/chemical bond^{-1}2 contains only bulk parameters. 7 refs.

36782 (KFK—4309) Effect of additives on the metallurgical and superconducting properties of Nb_3Sn wires. Drost, E. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Technische Physik; Karlsruhe Univ. (T.H.) (Germany, F.R.)). Sep 1987. 116p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88753579/JAW.

For Nb_3Sn wires the effect of additives Fe, Ni, Ta, Ti, Ga, Zn and H on the metallurgical and superconducting properties is studied. For comparison the wires were prepared under identical conditions. For Fe and Ni additives to Nb a reduced growth of A 15 compound layer is observed in contrast to Ti additives. Auger analysis of Nb_3Sn layers reveal a remarkable diffusion profile for the Ti additive, showing a concentration step at the interface between the Nb core and the Nb_3Sn layer. The paramagnetic additives Fe and Ni cause an enhancement of the high field critical current densities (for B > 11 T) similar to the well known Ta and Ti additives. For the first time this work presents residual resistivity values for Nb_3Sn filaments prepared by the bronze process. On fully reacted filaments an increase of the residual resistivity form rho_0=15 $\mu\Omega$cm for the binary Nb_3Sn to 40 $\mu\Omega$cm for Ti alloyed Nb_3Sn (1.3 at %) is found. The investigations furnish a strong evidence for the correlation between rho_0 and the enhancement of B/sub c2/ in alloyed Nb_3Sn wires, which is derivable from the GLAG-theory. (orig.GSCH).

36783 (LA—11065) High-strain-rate, high-temperature biaxial testing of DOP-26 iridium. George, T.G. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 47p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010471/JAW.

High-strain-rate biaxial punch tests were performed on DOP-26 (Ir-0.3 wt.% tungsten) iridium-alloy disc given annealing and aging heat treatments. Test temperatures ranged between 600 and 1440{degree}C, and punch velocity was held constant at 45 m/s. Three types of samples were evaluated: Z-batch old-process discs, B-batch old-process discs, and B-batch new-process discs. The results indicate that batch-to-batch variations in ductility are significant and that new-process iridium is slightly more ductile than old-process material. 12 refs., 43 figs., 26 tabs.

36784 (LA-UR—88-625) Influence of peak pressure on the substructure evolution and shock wave profiles of Ti-6Al-4V. Gray, G.T. III; Morris, C.E. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 8p. (CONF-880681—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88006458/JAW.

From 6. world conference on titanium; Cannes, France (6 Jun 1988).

The object of the present study was to investigate the influence of peak pressure on the residual structureproperty relationships and the wave profile behavior of shock-loaded Ti-6-4. A further aim of the present work was to determine if the alpha to omega phase transformation occurred in Ti-6-4 using {open+-quotes}real time{close+-quotes} VISAR and post-mortem shock recovery techniques. The following conclusions can be drawn: over the velocity range investigated no evidence of an alpha to omega phase transition was observed in Ti-6-4 with either VISAR wave profiles or shock recovery experiments; increasing peak pressure results in an increased dislocation density and yield strength in shock-loaded Ti-6-4; deformation of the (1121) type, are observed in the 10 and 13 GPa; the low pressure Hugoniot for Ti-6-4 is given by U/sub s/ = 5.123 kms + 1.083 U/sub p/ for U/sub p/ < 1.4 kms; the high pressure relation is given by U/sub s/ = 5.030 + 1.056 U/sub p/. 9 refs., 5 figs.

36785 (LA-UR—88-1556) Scaling of the magnetoresistance of UBe_{13} under pressure. Willis, J.O.; McElfresh, M.W.; Thompson, J.D.; Smith, J.L.; Fish, Z. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 16p. (CONF-880703—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011054/JAW.

From Joint INTERMAG/magnetism and magnetic materials conference; Vancouver, Canada (11 Jul 1988).

We report magnetoresistance measurements of the heavy electron compound UBe_{13} above the superconducting transition temperature T/sub c/ and below 4 K for pressures P up to 19 kbar and for magnetic fields H up to 9T. We observe strong negative magnetoresistance at all pressures and temperatures. The resistivity {rho} is quadratic in temperature T from T/sub c/ up to a maximum temperature of 1 K at 1 bar increasing to 2 K at 19 kbar. The slope of the T^2 term decreases with both H and with P. We find that δ(H) {triple+-bond} {minus} ({rho}(H) {minus} {rho}(0)){rho}(0) for a given pressure scales as a function of HT and exhibits power law behavior over one decade with an exponent of 1.7. In addition, δ(H) at high pressure shows this same power law over a more limited HT range. 16 refs., 5 figs.

36786 (LA-UR—88-1601) Neutron irradiation study of Nd-Fe-B permanent magnets made from melt-spun ribbons. Brown, R.D.; Cost, J.R.; Meisner, G.P.; Brewer, E.G. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 7p. (CONF-880703—3). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88011053/JAW.

From Joint INTERMAG/magnetism and magnetic materials conference; Vancouver, Canada (11 Jul 1988).

Radiation-induced changes in the magnetization of sintered Nd-Fe-B permanent magnets are known to vary widely among specimens produced by different manufacturers. Samples of Nd-Fe-B MAGNEQUENCH magnets, which are made from melt-spun ribbons, have now been studied and show a much reduced sensitivity to neutron irradiation than do sintered Nd-Fe-B magnets. All melt-spun ribbon-based MAGNEQUENCH magnets, i.e., epoxy-bonded, hot-pressed, and die-upset magnets, show essentially the same slow decrease in magnetic remanence with neutron dose. Measurements of the open-circuit remanence B/sub r//B/sub ro/ at various times during the irradiation show a decay of only 1.5% of the preirradiated value for the MAGNEQUENCH magnets after 1 hour of irradiation, or a dose of 1.4 {times} 10^{18} neutrons/cm^2, compared to a 4.6% drop in remanence for the best sintered Nd-Fe-B magnet (Sumitomo 30H) with the same irradiation dose. Moreover, after 5.3 hours of irradiation, the remanence drops by only 3% for the MAGNEQUENCH magnets. Magnets made from melt-spun ribbons are thus the least sensitive to neutron irradiation so far measured for Nd-Fe-B permanent magnets, but are somewhat more sensitive than samarium-cobalt magnets. 12 refs., 1 fig.

36787 (LBL—24512) A method for determining the solubility of hydrogen in molten aluminum-lithium alloys. Verma, T. (Lawrence Berkeley Lab., CA (USA)). Aug 1988. Contract AC03-76SF00098. 60p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88009807/JAW.

A constant volume technique, involving the measurement of differential pressure generated between a control volume subjected to an inert gas and an "active" volume subjected to hydrogen, has been used to determine the solubility of hydrogen in molten 2090 aluminum lithium alloys. The solubility of hydrogen in 2090 aluminum lithium alloys obeys Sievert's law and lies between 1-6 ppM for pressures varying from 250-950 mm Hg in the temperature range 650-750{degree}C. The heat of dissolution of hydrogen is of the order of 135 kJ mol^{-1}in this alloy.

36788 (LBL—25022) Weldability of 2090 Al-Cu-Li alloy. Sunwoo, A.J.; Morris, J.W. Jr. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 24p. (CONF-8804142—2). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011963/JAW.

From American Welding Society meeting; New Orleans, LA, USA (18 Apr 1988).

The weldability of 2090 was studied along with the metallurgical changes associated with welding and aging. Autogenous bead-on-plate welds are produced using two different base metal tempers, as-received condition (T3) and peak-aged condition (T8) and two different welding processes, GTAW and EBW. The optimum aging condition is determined for the EB and GTA weldments. The results of weldability and aging studies indicate that the best aging temperature for the base metal and EB weldments is 160°C, which results in a 75% joint efficiency and for the GTA weldment is 190°C, which produces a 55% joint efficiency. Aging at 230°C leads to a serious deterioration in the properties. The distribution of precipitates in the fusion zone appears to be the primary factor in controlling the weldment strength and elongation.

36789 (LBL—25031) Ion-implantation of reactive elements in improving the adhesion of thermally grown Cr_2O_3 scales. Hou, P.Y.; Stringer, J. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 18p. (CONF-8804117—1; CONF-8804117—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009818/JAW.

From Adhesion in solids; Reno, NV, USA (5 Apr 1988).

The high-temperature oxidation behavior of Al, Y and Hf ion-implantation in Ni–25wt%Cr alloy with dosages ranging from 10^{15}–10^{17} ionscm^2 has been studied. Results are compared with the unimplanted alloy, a Xe-implanted alloy and alloys with 0.2wt% Y or 1wt% Al additions. Oxidation tests were carried out at 1000{degree}C and 1100{degree}C in 1 atm. O_2. It is found that the ion-implantation of Y and Hf greatly reduced oxidation rate and improved scale adherence after a critical implantation dosage, {approximately}1 {times} 10^{16} ionscm^2, has been reached. The improved scale adhesion is attributed to both a reduction in growth stress and a strengthened scalealloy interface, which all developed as a result of a modified scale growth process. 8 refs., 6 figs., 1 tab.

36790 (LBL—25050) Long-range structural effects in the anomalous voltammetry of Pt.3. Ross, P.N. Jr. (Lawrence Berkeley Lab., CA (USA)). Jan 1988. Contract AC03-76SF00098. 34p. (CONF-8708253—1; CONF-8708253—). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88010782/JAW.

From Symposium on molecular phenomena at electrode surfaces; New Orleans, LA, USA (30 Aug 1987).

The history of the observation of anomalous voltammetry is reviewed and an experimental consensus on the relation between the anomalous behavior and the conditions of measurement (e.g., surface preparation, electrolyte composition) is presented. The behavior is anomalous in the sense that features appear in the voltammetry of well-ordered Pt(111) surfaces that had never before been observed on any other type of Pt surface, and these features are not easily understood in terms of current theory of electrode processes. A number of possible interpretations for the anomalous features are discussed. A new model for the processes is presented which is based on the observation of long-period ice-like structures in the low temperature states of water on metals, including Pt(111). It is shown that this model can account for the extreme structure sensitivity of the anomalous behavior, and shows that the most probable explanation of the anomalous behavior is based on capacitive processes involving ordered phases in the double-layer, i.e., no new chemistry is required.

36791 (ORNL/M—548) Nickel aluminides: A new family of nickel + aluminum alloys featuring simple composition, low density, excellent oxidation resistance, and high yield strength that increases with temperature. (Oak Ridge National Lab., TN (USA)). [1988]. Contract AC05-84OR21400. 10p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010692/JAW.

The three alloys presented in this brochure are based on the intermetallic compound Ni_3Al. Ni_3Al is brittle, but by changing the composition to $Ni_{76}Al_{24}$ and adding {approximately}200 ppM boron the alloy becomes ductile. The strength of these alloys depends entirely on the behavior of the ordered crystal structure and the grain size. Larger grain size favors good high temperature strength and fine grain size favors good low temperature strength. An unusual feature of the strength is that in annealed material the yield stress increases with test temperature up to about 800{degree}C. Nickel aluminides display excellent oxidation and corrosion resistance characteristics which can be further enhanced with simple additives. Forming and processing can be accomplished by a variety of methods. Molten aluminides can be formed into ingots, castings, and near net shapes by several different processes. Nickel Aluminides can also be produced and consolidated from powder. Both cast and powder ingots, sheet, tube hollows, and rod can be further processed in several ways.

36792 (ORNL/TM—10548) Calculation of the specific and volumetric enthalpies of Ge-Si alloys. Alexiades, V.; Wichner, R.P. (Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OR21400. 35p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008949/JAW.

A procedure is developed for the calculation of specific and volumetric enthalpies of Ge-Si alloys as an initial step in the evaluation of these materials for heat storage in solar dynamic power systems. The calculation is based on the thermodynamics of non-ideal solutions and the reported {open←quotes}regular{close←quotes} nature of liquid and solid Ge-Si solutions. With only minor modifications, all of the other thermodynamics properties of this alloy system may additionally be evaluated. Use of Ge-Si alloys for heat storage purposes in solar receivers entails both negative and positive aspects. The negative aspects relate largely to the non-congruent nature of the phase change process which precludes isothermal heat delivery. However, on the positive side are high thermal conductance, low volume change on melting, and the availability of a range of heat delivery temperatures by modification of only the alloy composition.

36793 (PB—88-864012/XAB) Neodymium-Iron-Boron (Nd-Fe-B) permanent magnets. January 1984-May 1988 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1984-May 1988. (National Technical Information Service, Springfield, VA (USA)). May 1988. 111p. NTIS PC N01/MF N01.

This bibliography contains citations concerning the development, fabrication, and applications of neodymium-iron-boron (Nd-Fe-B) permanent magnets. Topics include magnetization and aging of magnets, crystal structure and magnetic properties, coercivity of Nd-Fe-B magnets, magnetic hardening mechanism, and high and low temperature properties of Nd-Fe-B magnets. Applications of Nd-Fe-B permanent magnets in electrical machines, magnetomechanical devices, and medical and dental devices are presented. (Contains 204 citations fully indexed and including a title list.)

36794 (RFP—4220) Wettability of brazing alloys on molybdenum and TZM [Mo-Ti-Zr alloy]. McDonald, M.M.; Keller, D.L.; Heiple, C.R.; Hofmann, W.E. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). 1988. Contract AC04-76DP03533. 30p. (CONF-8804142—1). NTIS, PC A03;3. Order Number DE88010900/JAW.

From American Welding Society meeting; New Orleans, LA, USA (18 Apr 1988).

Vacuum brazing studies have been performed on molybdenum and TZM (0.5Ti-0.08Zr-Mo). Wettability tests have been conducted for nineteen braze metal filler alloys on molybdenum and thirty-two braze metal filler alloys on TZM over a wide range of temperatures. A wetting index, which is a function of contact angle and braze alloy contact area, was determined for each filler alloy at each brazing temperature. The nature and extent of interaction between the brazing alloys and the base metals was analyzed by conventional metallography, scanning-electron microscopy, and electron microprobe analysis. A comparison is made between the behavior of filler alloys on molybdenum and TZM -- filler alloys consistently exhibited less wettability on TZM than on molybdenum. The lower wettability of TZM is believed to be due to a small

amount of titanium in the surface oxide on TZM. Cracking was observed in the base metal under some of the high temperature braze deposits. The cracking is shown to arise from liquid metal embrittlement from nickel in the high temperature braze alloys. 7 refs., 11 figs., 2 tabs.

36795 **(SAND—87-1818) Stress relaxation of a titanium (Ti-6Al-4V) threaded joint.** Stephens, J.J.; Munford, J.W. (Sandia National Labs., Albuquerque, NM (USA)). May 1988. Contract AC04-76DP00789. 24p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010102/JAW.

The amount of load relaxation which can be expected in the W88 Titanium Mounting Ring is summarized. We have performed analytical estimates of the amount of stress relaxation under uniaxial loading conditions, using room temperature creep data for Ti-6A1-4V alloy which was generated in support of previous Sandia programs. In addition, we performed load-relaxation experiments up to 1000 hours duration on torque-loaded model components in order to evaluate experimentally the amount of load relaxation under loading conditions which are identical to those experienced by the mounting ring. Results of both approaches indicate that the amount of load relaxation during a thirty-year component life will not be enough for concern.

36796 **(SAND—87-2541C) Friction, wear and electrical contact resistance of precious metal alloys.** Pope, L.E.; Peebles, D.E.; Barton, B.M. (Sandia National Labs., Albuquerque, NM (USA); Monsanto Research Corp., Miamisburg, OH (USA). Mound). 1988. Contract AC04-76DP00789. 29p. (CONF-880317—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011244/JAW.

From ASM symposium on engineered materials for advanced friction and applications; Gaithersburg, MD, USA (1 Mar 1988).

The preferred selection of precious metal electrical contact materials depends on the contact geometry, contact stress, test ambient values of electrical contact resistance and whether friction and/or wear must be controlled. Wiper-type contact couples that operate in dry hydrocarbon-free atmospheres, particularly if low and steady friction coefficients and minimal wear are required, are typically that of a palladium alloy pin (ASTM B540) sliding on a gold alloy plate (ASTM B541). These materials have a contact resistance of approximately ten milliohms and a friction coefficient less than 0.5 for the most common operational environments. Segregation of sulfur up to a few atomic percent to wear tracks formed on the gold alloy is not detrimental. The accumulation of larger concentrations of sulfur can form surface films of cuprous sulfide which increases the contact resistance to a few tens of milliohms. Large electrical contact resistances (greater than one ohm) are measured only when rider wear becomes dominant and ridges of Pd-containing material are formed in wear tracks. Ion implantation of carbon into the Au alloy decreases the friction coefficient without increasing the electrical contact resistance. In contrast, the implantation of nitrogen into the Au alloy increases the friction coefficient, but does not change the electrical contact resistance. In ambients containing hydrocarbons, the implantation of carbon is not recommended because it promotes friction polymer formation. 19 refs., 5 figs., 8 tabs.

36797 **(SAND—87-2761C) Initiation of explosive molten aluminum-water interactions at wet or underwater surfaces.** Nelson, L.S.; Eatough, M.J.; Guay, K.P. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 12p. (CONF-880724—7). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88004686/JAW.

From 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference; Houston, TX, USA (24 Jul 1988).

In certain metallurgical operations, molten aluminum may inadvertently contact a wet or underwater solid surface. Occasionally, depending on the nature of the surface and contact conditions, an explosive melt-water interaction may be initiated. These interactions are sometimes attributed to the entrapment of water between the melt and the surface. In this work, we have used laboratory experiments to investigate these surface initiations. By coupling our results with the literature of boiling and bubble nucleation, we are able to propose and support a mechanism for the initiation of these vigorous interactions. The mechanism involves superheating of a thin layer of liquid water enclosed between the melt and a water-wettable solid surface, followed by explosive vaporization. Because nonwettable surfaces offer copious bubble nucleation sites, superheating is suppressed and the explosions are reduced or eliminated at hydrophobic surfaces. 15 refs., 2 figs., 2 tabs.

36798 **(SAND—87-2791C) Diffusion models of crack growth due to random overloads.** Winterstein, S.R.; Veers, P.S. (Stanford Univ., CA (USA). Dept. of Civil Engineering; Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 5p. (CONF-880587—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008811/JAW.

From ASCE specialty conference on probabilistic mechanics and structural safety; Blacksburg, VA, USA (25 May 1988).

For certain random vibration loads, crack growth may be adequately estimated with random load models that ignore sequence effects. ASTM test results have been accurately predicted from narrow-band (Rayleigh) load models; analytical results may also include bandwidth effects and racetrack cycle-counting (Veers, 1987) and non-Gaussian loads (Winterstein, to appear). Systematic tensile overloads may produce greater load sequence effects. These are predicted from simple diffusion models, which estimate the crack-opening stress from plastic zone considerations. The reset stress has been fixed during retarded growth; more generally, a {open quotes}steady-state{close quotes} reset stree distribution can be estimated from diffusion theory (Veers, 1987). In general as overload variability (Vγ) increases, overload-affected regions overlap more often and net retardation is less. Therefore, the assumption of regular overloads, common in fatigue block-load testing, may generally be unconservative. 9 refs., 2 figs.

36799 **(SVF—281) Experience of corrosion and corrosion protection of the seawater systems of Swedish thermal power plants.** Henriksson, S. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Oct 1987. 45p. (In Swedish and English). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753350/JAW.

The sea water structures comprised are screen houses, piping, condensers and other heat exchangers, pumps and valves. In addition information is given about non-asbestos gasket materials used in the sea water systems. The severest corrosion problems were caused by the heat exchangers as long as they were equipped with tubes of aluminium brass and 90/10 cupro nickel. This was of particular importance in the nuclear power plants because of their high demand of operational safety. Most of these problems have been solved by the widespread use of titanium in condensers and other critical heat exchanger positions. Direct cooling with sea water has also been replaced by fresh water cooling from secondary systems cooled by plate or tubular heat exchangers of titanium. In fossil peak-load plants with short annual operational times aluminium brass condenser tubes can still be justified from an economic point of view. The corrosion of screen house equipment and sea water pumps is generally suppressed well enough by cathodic protection. Sea water pipes and valves, usually of carbon steel or cast iron with rubber lining or solvent-free epoxi coating, do not cause serious corrosion problems. The most frequent gasket material in the sea water systems is solid rubber. Plastic reinforced rubber is also used to some extent but the experience is limited for the present.

36800 **(SVF—282) Corrosion tests of stainless steels in chlorinated sea water at 45 degrees C.** Henriksson, S. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Nov 1987. 42p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753351/JAW.

To supplement previous corrosion tests of high alloy stainless steels in chlorinated seawater at 35 degrees C three Swedish stainless steels - Avesta 254 SMO, Avesta Monit and Sandvik Sanicro 28 - have been tested at 45 degrees C in North Sea water continously chlorinated with 0.5 and 2.0 ppm chlorine. The most important results can be summarized as follows: - Tubes of the steel 254 SMO, which are seal welded to tube sheets of austenitic stainless steels, are resistant to localized corrosion even at 45 degrees C. - The fully ferritic steel MONIT has to be seal welded to austenitic

tube sheets with an overalloyed austenitic filler (Inconel 625 type) in order to avoid corrosion of the welds. - The steel 254 SMO, which was fully resistant to crevice corrosion in simulated flange joints at 35 degrees C, exhibits at 45 degrees C a tendency to superficial crevice attack. - There is no important difference in the galvanic corrosion behaviour of NiAl-bronz (UNC C95500) in contact with the steel 254 SMO at 35 and 45 degrees C. Decreasing the chlorine content from 2.0 to 0.5 ppm, however, reduces the corrosion rate considerably.

36801 **(UCID—21395) Rocket-propellant burn tests of silicide-coated niobium and tantalum.** Curtis, P.G.; Krikorian, O.H.; Helm, F.H. (Lawrence Livermore National Lab., CA (USA)). 20 Apr 1988. Contract W-7405-ENG-48. 33p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010729/JAW.

Coatings designed to protect refractory metals in fire situations were tested on niobium and tantalum in a furnace and in a rocket-fuel flame. The best performance was obtained from Cr-Si-type silicide coatings applied by the pack-cementation process. The main mode of failure of the coated parts was corrosion by molten stainless steel rather than oxidation.

36802 **(UCRL—96445) Formation of metastable structures and amorphous phases in Cu-W alloys using the triod sputtering technique.** Rizzo, H.F.; Tanner, L.E.; Wall, M.A.; Massalski, T.B.; McClanahan, E.C. (Lawrence Livermore National Lab., CA (USA); Carnegie-Mellon Univ., Pittsburgh, PA (USA); Pacific Northwest Lab., Richland, WA (USA)). Nov 1987. Contract W-7405-ENG-48. 13p. (CONF-871124—100). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009051/JAW.

From Fall meeting of the Materials Research Society; Boston, MA, USA (30 Nov 1987).

The triode sputtering technique and a {open←quotes}split-target{close←quotes} arrangement were used to produce metastable crystalline and amorphous phases in the Cu-W system under essentially oxygen-free conditions. Large metastable extensions of solid solubility were observed both from the Cu (fcc) and W (bcc) sides of the phase diagram, and a wide range of metallic glass formation was observed, approximately between 30 and 65 at. % W. The thickness of the amorphous Cu-W phase (40-160μm) that can be deposited without the formation of the metastable bcc phase appears to be dependent on the Cu-W alloy composition. On heating, the crystallization temperature of the amorphous alloys was higher than 350{degree}C. The behavior of the lattice parameter and near-neighbor distance has been studied with x-ray diffraction, showing small positive deviations from an assumed Vegard's Law. Hardness measurements indicate that the metastable crystalline phases are relatively harder than the amorphous phase. 11 refs., 9 figs.

36803 **(UCRL—96638-Rev.1) Studies of internal stresses and surface roughness of sputtered Be and BeB films.** Hsieh, E.J.; Gillespie, C.H.; Pierce, E.L.; Hatcher, C.W. (Lawrence Livermore National Lab., CA (USA)). 26 Oct 1987. Contract W-7405-ENG-48. 9p. (CONF-871125—25-Rev.1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011737/JAW.

From 34. national vacuum symposium and topical conference; Anaheim, CA, USA (2 Nov 1987).

Beryllium is a low-Z metal which has a wide application in laser fusion. Recent studies have shown that the survivability of thin film coated optical mirrors against the prompt deposition of x-rays can be enchanced by inserting a beryllium "heat sink" layer between the reflective coating and the substrate. In both applications, the coating surface smoothness and internal stresses are important properties to be controlled by deposition parameters. In this study, we measured the film stresses and surface smoothness as a function of sputtering pressure. These data will allow us to select the best set of coating parameters for a given application. 4 refs., 2 figs.

36804 **(UCRL—97649) Fast transient thermophysical measurements at Livermore.** Gathers, G.R. (Lawrence Livermore National Lab., CA (USA)). Jun 1988. Contract W-7405-ENG-48. 33p. (CONF-880606—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011726/JAW.

From 10. symposium on thermophysical properties; Gaithersburg, MD, USA (20 Jun 1988).

The development of the Isobaric Expansion Experiment at Lawrence Livermore National Laboratory is described. Rod samples are self heated by current from a capacitor bank while current and sample voltage, sample cross section and temperature are measured continuously as functions of time. The system allows nearly complete thermodynamic characterization of a material along an isobar in a single shot. The pressure of the isobar is determined by containing the sample in argon gas at a predetermined ambient pressure. Correlation of the measured quantities allows elimination of time as a common parameter. Quantities corresponding to a given time are taken to refer to a single equilibrium state. Temperature stagnation and volume and resistivity changes during phase transitions may be seen and allow the heat of transformation and the slope of the phase line in the P, T plane to be determined. Other derived quantities are specific heat c/sub p/, volume corrected electrical resistivity and bulk thermal expansion coefficient. A special advantage of the technique is that all quantities are measured on the same sample in a single experiment. The short time duration of the measurements allows access to a temperature range beyond that available to slower methods.

36805 **(UCRL—98230) The preparation of mechanically alloyed powders for TEM [transmission electron microscopy] examination.** Kamenetzky, E.A.; Wall, M.; Castro, R.; Tanner, L.E. (Lawrence Berkeley Lab., CA (USA); Lawrence Livermore National Lab., CA (USA)). 12 Feb 1988. Contract W-7405-ENG-48;AC03-76SF00098. 7p. (CONF-871124—99). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008043/JAW.

From Fall meeting of the Materials Research Society; Boston, MA, USA (30 Nov 1987).

Transmission electron microscopy (TEM) specimens of mechanically alloyed elemental Ni and Nb powders are prepared by a new procedure. The alloyed powders are mixed with smaller Al powder and fill an aluminum ring (3 mm outer diameter). This composite is cold pressed together with the Al powders taking most of the deformation. The compacted specimen can be mechanically thinned. Electropolishing and ion milling can then proceed by standard methods with special precautions to minimize differential polishing or milling rates. Microstructural aspects of the formation of an amorphous phase by high-energy ball milling these powders have been studied. After 6 h each particle transforms to a heterogeneous layered composite of particles of one element in the matrix of the other. Particle size ranges from 15 nm to 90 nm. Mechanical alloying for 36 h results in the formation of an apparently uniform phase interspersed with a few small (4 nm to 30 nm) elemental crystalline particles. 9 refs., 4 figs.

36806 **(UCRL—98232) On the systematics of phase transformation in metallic alloys.** Tanner, L.E. (Lawrence Livermore National Lab., CA (USA)). 12 Feb 1988. Contract W-7405-ENG-48. 10p. (CONF-880586—1). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008041/JAW.

From Conference on competing interactions and microstructures, statics, and dynamics; Los Alamos, NM, USA (5 May 1988).

Phase transformations in metallic alloys proceed by diffusional replacive or diffusionless displacive mechanisms. These are generally viewed as independent processes without significant interactive coupling. However, new studies of displacive transformations, particularly regarding pretransformation phenomena, suggest that such coupling may indeed occur. If so, it should have a significant effect on the mode, morphology and mechanisms of the replacive transformations. In this paper we examine these possibilities in light of the most recent observations and thinking in this field.

36807 **Gruenelsen gamma and acoustic velocity for soft sphere fluids.** Shaner, J.W. (Los Alamos National Laboratory, Shock Wave Physics Group, Group M-6, MS J970, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* 89: No. 3, 1616-1624(1 Aug 1988).

New experimental and computational methods make possible measurement or simulation of the thermodynamic properties of fluids over wide ranges of temperature and density. We use a

model for fluid thermodynamics based on the (1/r)/sup n/ repulsive potential to show qualitatively what behavior one might expect for measurements of Grueneisen's gamma and acoustic velocity for compressed and expanded fluid metals and molecular fluids. We find limited regions of validity for such empirical rules as rhoγ/sub G/ = constant and linear density dependence of sound velocity. These results are compared with experimental data for fluid metals, and with N_3 simulations presented in the accompanying paper.

36808 **Glancing-angle extended x-ray-absorption fine structure and reflectivity studies of interfacial regions.** Heald, S.M.; Chen, H.; Tranquada, J.M. (Brookhaven National Laboratory, Upton, New York 11973). *Physical Review [Section] B: Condensed Matter;* **38**: No. 2, 1016-1026(15 Jul 1988).

Glancing-angle extended x-ray-absorption fine structure (EXAFS) and x-ray reflectivity measurements have been made for a Au surface and several Cu/Al interfaces. The Cu/Al samples consisted of 1000 A Al on Cu, and the measurements demonstrate the potential of these techniques for determining interface structure and morphology. In particular, distinct differences were observed in both the reflectivity and interface EXAFS signals for Cu/Al samples prepared under different conditions. The information obtained on these samples is compared with information obtained by transmission electron microscopy, Rutherford backscattering, and Auger sputter profiling, and excellent agreement is found. The glancing-angle measurements are distorted by anomalous dispersion effects and a simple analytic correction scheme is presented. This correction has been tested on the Au data and found to work well for the entire range of incident angles. For the Cu/Al interfaces the corrections allowed quantitative analysis of the Cu-Al bonding at the interface, and a substantial difference is found for samples prepared under UHV and non-UHV (10/sup -6/ Torr) conditions. These glancing-angle techniques offer some unique characteristics and are compared to more standard interface studies.

36809 **Relativistic calculations of 2p and 3d excitation energies in the actinide metals.** Herbst, J.F.; Wilkins, J.W. (Physics Department, General Motors Research Laboratories, Warren, Michigan 48090-9055). *Physical Review [Section] B: Condensed Matter;* **38**: No. 2, 1027-1039(15 Jul 1988).

A systematic investigation of 2p and 3d core-electron excitation energies in the actinide metals Ac—Am is described. Crystal potentials are constructed via the renormalized-atom method, and excitation energies are derived from differences between band total energies for various fixed, integral values of the 5f occupancy n. Calculations have been performed for the principal excitations, involving 6d-7s conduction-electron screening of a core hole, as well as for levels associated with 5f screening in the final state. For a given metal the principal excitation energies decrease at a rate of 4—6 eV per increment in n, while the 5f-screened levels are less sensitive to 5f occupation. The energetics of 6d-7s versus 5f screening is examined by calculations for ionized final states. We compare our findings with analogous results for core levels in the rare earth metals and with recent experimental information.

36810 **Formation of amorphous Ti alloy layers by excimer laser mixing of Ti on AISI 304 stainless-steel surfaces.** Jervis, T.R.; Nastasi, M.; Zocco, T.G.; Martin, J.A. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Applied Physics Letters;* **53**: No. 1, 75-77(4 Jul 1988).

We used excimer laser radiation at 308 nm to mix thin layers of Ti into AISI 304 stainless steel. Different numbers of shots at a fluence about twice the threshold for melting varied the amount of mixing. When mixing is sufficiently complete, an amorphous surface layer is formed with Ti substituting for Fe on a one-to-one basis in the alloy. The laser mixing process, unlike Ti ion implantation, does not result in high incorporation of C in the processed layer, although some C from surface and interface contamination is incorporated into the surface layer.

36811 **Evolution of dislocation structure during inverse creep of a nickel aluminide: Ni—23.5Al—0.5Hf—0.2B (at. %).** Schneibel, J.H.; Horton, J.A. (Metals and Ceramics Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831). *Journal of Materials Research;* **3**: No. 4, 651-655(Jul 1988).

A well-annealed polycrystalline nickel aluminide of composition Ni—23.5Al—0.5Hf—0.2B (at. %) shows inverse creep behavior at 1033 K and 250 MPa. The minimum creep rate does not correspond to a steady-state creep condition. The increase in the creep rate with strain and time is accompanied by an increase in the volume fraction of dislocation-containing regions. The inverse transient can be eliminated by prestraining at room temperature. It is absent in the diffusional creep regime.

36812 **Effect of grain size on yield strength of Ni_3Al and other alloys.** Takeyama, M.; Liu, C.T. (Metals and Ceramics Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831). *Journal of Materials Research;* **3**: No. 4, 665-674(Jul 1988).

This paper analyzes the effect of grain size on yield stress of ordered Ni_3Al and Zr_3Al, and mild steels that show Lueders band propagation after yielding, using the Hall—Petch relation, σ/sub y/ = σ_0+k/sub y/ d^{-1}/sup //², and the new relation proposed by Schulson et al., σ/sub y/ = σ_0+kd/sup -(//sup p//sup +1)/2/ [Schulson et al., Acta Metall. 33, 1587 (1985)]. The major emphasis is placed on the analysis of Ni_3Al data obtained from published and new results, with a careful consideration of the alloy stoichiometry effect. All data, except for binary stoichiometric Ni_3Al prepared by powder extrusion, fit the Hall—Petch relation, whereas the data from boron-doped Ni_3Al and mild steels do not follow the Schulson relation. However, no conclusion can be made simply from the curve fitting using either relation. The results are also discussed in terms of Lueders strain and alloy preparation methods. On the basis of the Hall—Petch analysis, the small slope k/sub y/ is obtained only for hypostoichiometric Ni_3Al with boron, which would be related to a stronger segregation of boron in nickel-rich Ni_3Al. In addition, the potency for the solid solution strengthening effect of boron is found to be much higher for stoichiometric Ni_3Al than for hypostoichiometric alloys.

36813 **Sliding and thermal effects on sulfur segregation to palladium alloy contact surfaces.** Lloyd, J.N.; Vook, R.W.; Pope, L.E. (Laboratory of Solid State Science and Technology, Physics Department, Syracuse University, Syracuse, New York 13244-1130). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **6**: No. 4, 2462-2466(Jul 1988).

Oscillatory pin-on-plate experiments have been completed in an ultrahigh vacuum system; both pin and plate materials were a palladium alloy (ASTM B540). No enhancement of sulfur occurred in wear tracks due to 5000 wear cycles performed at room temperature in atmospheric helium. After wear tracks were formed, thermally activated segregation of sulfur to the surface was measured in wear tracks and at off-track regions. The rate of sulfur segregation was determined with Auger spectroscopy by recording the 152-eV sulfur peak height during in situ isothermal anneals. Segregation of sulfur to the surface is adequately explained by a bulk diffusion process, and a bulk diffusion constant of 2.9 +- 0.4 eV was measured for the off-track regions. This compares favorably with the bulk diffusion constants for sulfur in iron (2.2 eV), copper (1.7 eV), and silver (1.7 eV). Within wear tracks sulfur initially accumulated at a higher rate, but after a period of heating sulfur segregation rates were the same in wear tracks and at off-track regions. The initially higher rate of sulfur accumulation in wear tracks is attributed to enhanced diffusion in the deformed layer. After the deformed layer was annealed by heating, the rate of sulfur segregation was the same in wear tracks as at off-track regions.

36814 **Displacement of CO by more weakly adsorbed hydrogen on the Ni(100) surface.** Gland, J.L.; Shen, S.; Zaera, F.; Fischer, D.A. (Corporate Research Laboratory, Exxon Research and Engineering Co., Annandale, New Jersey 08801). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **6**: No. 4, 2426-2430(Jul 1988).

We report here hydrogen induced displacement of chemisorbed CO from the Ni(100) surface. The displacement reaction is unexpected since CO is adsorbed more strongly than atomic hydrogen on the Ni(100) surface. Hydrogen pressures of 10/sup -5/ to 10/sup -3/ Torr cause displacement of chemisorbed CO in the 309—330 K temperature range in a matter of minutes. After dis-

placement, the surface contained only the undisplaced CO and hydrogen. No surface contamination was observed either by Auger spectroscopy or temperature programmed desorption after evacuation. The rates were measured by integration of the thermal desorption spectra taken for a series of displacement times. The displacement reaction is first order in CO surface coverage with a break in rate occurring with decreasing coverage. The activation energy for the high-coverage displacement rate is ~8 +- 2 kcal/mol while the activation energy for the low-coverage displacement rate is ~12 +- 1 kcal/mol. No CO displacement is observed with either He or Ne. Adsorbed hydrogen is displaced by CO. The energetics of the displacement reaction coupled with the reaction probabilities observed suggest either direct energy transfer between the dissociating hydrogen and coadsorbed CO or substantial modification of adsorbed CO by high coverages of coadsorbed hydrogen. Using the current results we cannot distinguish between these mechanistic possibilities at present.

36815 Sliding and thermal effects on sulfur segregation to gold alloy contact surfaces. Lloyd, J.N.; Vook, R.W.; Pope, L.E. (Laboratory of Solid State Science and Technology, Physics Department, Syracuse University, Syracuse, New York 13244-1130). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **6**: No. 4, 2467-2473(Jul 1988).

Thermally induced surface segregation of sulfur has been measured on a gold alloy (ASTM B541). Comparisons were made among "as-received," abraded, and wear track surfaces that were ion-sputter cleaned before heating. The wear tracks were formed by oscillatory sliding at room temperature in a pin-on-plate configuration; the pin was a palladium alloy (ASTM B540). Wear tracks and heating were accomplished in situ in an ultrahigh vacuum system. The elemental compositions were measured with Auger electron spectroscopy. Previous conclusions were confirmed that sulfur segregates to wear tracks due to rubbing alone and that the source of the sulfur was the bulk material. It was found that thermal sulfur segregation was significantly greater in wear tracks than on abraded surfaces, and both wear tracks and abraded surfaces had greater thermal sulfur segregation than as-received surfaces. In the case of as-received surfaces, a highly anisotropic distribution of sulfur was observed and was attributed to enhanced diffusion of sulfur along grain boundaries and/or defects in the near-surface material. Thermal segregation was strongly influenced by the thermal treatment of the sample.

36816 Thermodynamic and kinetic basis for understanding metastable phase formation during ion-beam mixing of nickel—aluminum alloys. Eridon, J.; Was, G.S.; Rehn, L. (Department of Nuclear Engineering, The University of Michigan, Ann Arbor, Michigan 48109). *Journal of Materials Research;* **3**: No. 4, 626-639(Jul 1988).

A quantitative thermodynamic explanation for the formation of metastable phases in the nickel—aluminum alloy system through heavy-ion irradiation is presented. The role of kinetics in the transformation to a metastable state is also investigated. Experiments involved the irradiation of both layered nickel—aluminum samples and ordered intermetallic compounds with 500 keV krypton ions over a range of temperatures and compositions. Samples were formed by alternate evaporation of layers of nickel and aluminum. A portion of these samples was subsequently annealed to form intermetallic compounds. Irradiations were performed at both room temperature and 80 K using the 2 MV ion accelerator at Argonne National Laboratory. Phase transformations were observed during both in situ irradiations in the high-voltage electron microscope at Argonne and also in subsequent electron diffraction analyses of an array of irradiated samples. Metastable phases formed included disordered crystalline structures, an amorphous structure, and a hexagonal-close-packed structure. These phase structures were modeled using the embedded atom method to compute heats of transformation ΔH/sub s//sub —//sub ms/ from stable to metastable states. It was found that metastable states that have moderate heats of transformation, ΔH/sub s//sub -//sub ms/ ≃ 15%—20% of the heat of formation of the stable phase, form under irradiation. Metastable states with high heats of transformation, ΔH/sub s//sub —//sub ms/ ≃ 50% of the heat of formation of the stable phase, do not form under irradiation.

36817 Anomalous rf magnetoresistance in copper at 4 K. Rogers, J.T.; De Panfilis, S.; Melissinos, A.C.; Moskowitz, B.E.; Semertzidis, Y.K.; Wuensch, W.U.; Halama, H.J.; Prodell, A.G.; Fowler, W.B.; Nezrick, F.A.; and others. (Department of Physics and Astronomy, University of Rochester, Rochester, New York 14627). *Applied Physics Letters;* **52**: No. 26, 2266-2268(27 Jun 1988).

We have measured the effect of a magnetic field on the surface resistance of polycrystalline Cu at f = 1.2 GHz and at 4.4 K; under these conditions the surface resistance is well into the anomalous skin effect regime but has not reached its limiting value. We find that the transverse and longitudinal magnetoresistance are an order of magnitude smaller than the dc magnetoresistance and depend quadratically on the field. At low fields we observe a decrease in surface resistance with increasing field which can be interpreted as a size effect of the rf surface current, but is also typical of superconductors.

36818 Gradient terms in the Ginzburg-Landau free energy for pure and thorium-doped superconducting UBe_{13}. Brand, H.R.; Doria, M.M.; Pleiner, H. (Center for Nonlinear Studies, Mail Stop B258, Los Alamos National Laboratory, University of California, Los Alamos, New Mexico 87545). *Physical Review Letters;* **60**: No. 26, 2810-2810(27 Jun 1988).

A Comment on the Letter by P. Kumar and P. Wolfle, Phys. Rev. Lett. 59, 1954 (1987).

36819 Ellipsometric studies of magnetic phase transitions of Fe-Rh alloys. Chen, L.; Lynch, D.W. (Department of Physics and Ames Laboratory, Iowa State University, Ames, Iowa 50011). *Physical Review [Section] B: Condensed Matter;* **37**: No. 18, 10503-10509(15 Jun 1988).

Spectroscopic ellipsometric measurements of the dielectric functions for Fe-Rh alloys with 48, 50, 52, and 54 at. % Fe concentrations were performed between 25 and 125 °C in the 1—3-eV range. Results show that the band structure of Fe-Rh is not drastically affected as the antiferromagnetic-ferromagnetic phase transition occurs and is less affected than band-structure calculations indicate. Therefore, the large change in the linear term of the electronic specific heat between the antiferromagnetic and ferromagnetic phases can be attributed primarily to a magnetic contribution rather than to a change in the density of electronic states at the Fermi surface.

36820 Magnetic rare-earth superlattices (invited). Majkrzak, C.F.; Gibbs, D.; Boeni, P.; Goldman, A.I.; Kwo, J.; Hong, M.; Hsieh, T.C.; Fleming, R.M.; McWhan, D.B.; Yafet, Y. (Brookhaven National Laboratory, Upton, New York 11973;). *Journal of Applied Physics;* **63**: No. 8, 3447-3452(15 Apr 1988). Contract AC02-76CH00016;AC05-84OR21400.

The magnetic structures of several single-crystal, magnetic rare-earth superlattice systems grown by molecular-beam epitaxy are reviewed. In particular, the results of recent neutron diffraction investigations of long-range magnetic order in Gd-Y, Dy-Y, Gd-Dy, and Ho-Y periodic superlattices are presented. In the Gd-Y system, an antiphase domain structure develops for certain Y layer spacings, whereas modified helical moment configurations are found to occur in the other systems, some of which are commensurate with the chemical superlattice wavelength. References are made to theoretical interaction mechanisms recently proposed to account for the magnetic states of these novel materials.

36821 Magnetic properties of rare-earth transition-metal borides. Aly, S.H.; Singleton, E.; Hadjipanayis, G.C.; Sellmyer, D.J.; Zhao, Z.R. (Department of Physics, Kansas State University, Manhattan, Kansas 66506). *Journal of Applied Physics;* **63**: No. 8, 3704-3706(15 Apr 1988).

The magnetic and structural properties of quaternary RCo/sub 4-//sub x/Fe/sub x/B alloys with R = Nd, Sm, Er have been examined with magnetometry and x-ray diffraction. The $CeCo_4B$-type phase is found for all x in Er, for x≦3 in Sm, and for x = 0, 1, and 2 in Nd. Maximum coercivities have been obtained in a crys-

tallized $SmFe_3Co_3B$ sample with H/sub c/>17 kOe at room temperature.

36822 Low-temperature spin waves in amorphous Fe/sub 90-//sub x/Ni/sub x/Zr_{10}. Fernandez-Baca, J.A.; Lynn, J.W.; Rhyne, J.J.; Fish, G.E. (Solid State Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831 and Center of Materials Science, National Bureau of Standards, Gaithersburg, Maryland 20899). *Journal of Applied Physics;* 63: No. 8, 3749-3751(15 Apr 1988). Contract AC05-84OR21400.

Inelastic neutron scattering measurements have been performed on rapid-quenched ribbons of Fe/sub 90-//sub x/Ni/sub x/Zr_{10} (x = 1,5,10) to measure the small wave-vector spin-wave spectrum. At all three concentrations a quadratic dispersion relation typical of an isotropic ferromagnet is observed, but with anomalous properties at low temperatures. For x = 5 and 10 the excitations are found to broaden considerably for temperatures ≦0.3 T/sub c/. For x = 1 the spin waves not only broaden for T≦0.5T/sub c/, but the spin-wave energies decrease monotonically with decreasing temperature while a resolution-limited quasielastic component of the scattering develops. These results are consistent with a picture of competing ferromagnetic and antiferromagnetic interactions, with reentrant spin-glass behavior evident if the frustration is sufficiently strong.

36823 Heat treatment giving a stable high temperature micro-structure in cast austenitic stainless steel. Anton, D.L.; Lemkey, F.D. (to Dept. of Energy, Washington, DC). US Patent 4,737,204. 12 Apr 1988. Filed date 10 Oct 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A heat-treated cast austenitic stainless steel alloy consisting essentially of about 13-17% chromium, about 13-17% manganese, about 1.5-2.5% molybdenum, about 1.0-2.0% carbon, about 0.5-15% niobium, about 0.5-1.5% silicon, with the balance being iron is described which is produced by the process comprising: casting the alloy; subjecting the alloy to a prebraze heat cycle treatment including heat treating the cast alloy at about 735°-785°C for about 18-22 hours followed by cooling; and subjecting the alloy to a braze cycle heat treatment including: a first stage heat treatment at about 1040°-1090°C for about 20-40 minutes followed by cooling; an optional second stage heat treatment at about 765°-815°C for about 14-18 hours followed by cooling; an optional third stage heat treatment at about 625°-675°C for about 14-18 hours followed by cooling.

36824 Scaling similarities between fracture surfaces, energies, and a structure parameter. Williford, R.E. (Battelle, Pacific Northwest Labs., Richland, WA (US)). *Scripta Metallurgica;* 22: No. 2, 197-200(Feb 1988).

Several authors have recently discussed the use of fractals to describe fracture energies and their relationships to fracture surface geometries. A fractal is a self-similar geometric construction with non-integer dimensionality. Self-similarity means that the fractal appears the same under all magnifications. Dimensionalities are described below and more rigorously. Fracture energies (E) are quantified according to the scale of observation (L), e.g., J integrals on the macroscopic scale or interatomic potentials on the lattice scale. Surface geometries have been described by roughness parameters (R) or by the fracture surface dimensionality: D/sub s/ αln(R)ln(L). Another fractal dimensionality for fracture has been defined in terms of energy: D αln(E)ln(L). A frequently employed assumption is that D/sub s/ is the same for all scales, or that a plot of ln(R) versus ln(L) is linear. However, others have found that this is in general not true for fracture surfaces. It appears that the sigmoidal scaling behavior of fracture energies could be as common as others have observed for fracture surface roughnesses. In the present work, fracture energies are found to exhibit the same sigmoidal behavior when plotted versus an apparent material structure parameter. This parameter is herein called a "characteristic structural unit for fracture" (L/sub o/). Arguments leading to this conclusion are given.

36825 Aging effects in low pressure wire chambers containing TMAE. Woody, C.L. (Dept. of Physics, Brookhaven National Lab., Upton, NY (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* 35: No. 1, 493-497(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

The effects of aging in multiwire proportional chambers operated at low pressure with gas mixtures containing TMAE has been studied in connection with their use as a form of readout for BaF/sub 2/ crystals in high rate environments. Aging was induced by μv light which simulated high radiation exposure to BaF/sub 2/ crystals. Measurements were made on the loss in gain as a function of the total charge removed from the anode wires under various operating conditions. The results indicate a considerable improvement over previous aging effects measured at atmospheric pressure.

36826 (AD-A—190624/7/XAB) Corrosion and electrochemical behavior of binary magnesium alloys. Mukhina, I.Y.; Timonova, M.A.; Al'tman, M.B.; Yershova, T.I. (Air Force Systems Command, Wright-Patterson AFB, OH (USA). Foreign Technology Div.). 26 Jan 1988. Translation of Tekhnologiya Legk. Splavov, Nauch-Tekh Byull. Vses. Inst. Legk, Splavov (USSR) No. 4, 60-64(1971), by Carol S. Nack. (FTD-ID(RS)T—1384-87). 13p. NTIS, PC A03/MF A01.

A systematic investigation of the effect of 23 elements on the corrosion behavior of magnesium alloys in a 3% solution of Sodium Chloride (NaCl) and in a humid atmosphere was carried out. The values of the stationary potentials and the variation of the potentials through times are determined. The purpose of this work is to make a systematic investigation of the effect of alloying additives on the corrosion resistance and electrochemical characteristics of magnesium alloys. It is very interesting to study the corrosion behavior of binary systems, not only from the theoretical standpoint, but also from the practical one, since the selection of systems for developing corrosion-resistant alloys would be essentially random without these data. Reports give data about the effect of some elements on the corrosion and electrochemical behavior of magnesium alloys. However, the information in the literature about the systematic investigation of the effect of alloying components on the corrosion characteristics of magnesium alloys is inadequate.

36827 Science and technology of rapidly quenched alloys; Proceedings of the Symposium, Boston, MA, Dec. 1-3, 1986. Tenhover, M.; Johnson, W.L.; Tanner, L.E. Pittsburgh, PA; Materials Research Society (1987). 477p. (CONF-8612146—).

From Symposium on science and technology of rapidly quenched alloys; Boston, MA, USA (1 Dec 1986).

The present conference on the development status of rapidly-quenched alloys discusses topics in the formation and properties of amorphous metals and of rapidly quenched microcrystalline alloys, as well as the magnetic properties of rapidly quenched alloys. Attention is given to chemically produced precursors for the synthesis of amorphous metal alloy powders, the dynamics of rapid solidification in Si, bulk amorphous metals derived from metallic composites by solid-state reaction, strengthening mechanisms in consolidated amorphous alloys, the role of the melt-delivery tube in particle size control for confined gas atomization, and the effect of surface on the kinetics of Pd-Si glassy metal crystallization. Also discussed are excimer laser radiation-induced rapid solidification of Al and Al alloys, the microstructure and properties of rapidly solidified complex Ti alloys, the unusual rapidity of electron beam transient tempering, and glass formation in systems forming icosahedral quasi-crystals.

36828 Fracture behavior and microstructural characteristics of irradiated zircaloy cladding. Chung, H.M.; Yaggee, F.L.; Kassner, T.F. (Materials and Components Technology Div., Argonne National Lab., Argonne, IL 60439 (US)). pp 775-800 of Zirconium in the nuclear industry. Adamson, R.B.; Van Swam, L.F.P. Philadelphia, PA; ASTM (1987). (CONF-850601—). Contract W-31-109-ENG-38.

From 7. international conference on zirconium in the nuclear industry; Strasbourg, France (24 Jun 1985).

Zircaloy cladding tube specimens from commercial power reactor fuel assemblies (burnup >22 MWd/kgU) have been deformed to fracture at 325°C by either the internal gas-pressurization or the expanding-mandrel technique in a helium or argon environment containing no fission product species (e.g. I, Cs or CD). The fracture surfaces of ten irradiated specimens fractured by internal gas pressurization were examined by scanning electron microscopy; six specimens were found to contain various degrees of the pseudocleavage feature that is characteristic of pellet-cladding interaction failures. Out of ten test specimens fractured by expanding-mandrel loading, five were found to contain regions of pseudocleavage on the fracture surfaces. The specimens exhibited "X-marks" on the outer surface and brittle incipient cracks distributed on the inner surface, which are also characteristic of pellet-cladding interaction failures. Transmission/high-voltage electron microscope examinations of the thin-foil specimens obtained from regions adjacent to the failure sites showed that the ductile-fracture specimens were characterized by a high density of dislocations which showed normal α-vector-type Burgers vectors. In contrast, the brittle-type specimens were characterized by comparatively few dislocations which formed substructures.

36829 **Mechanistic modeling of zircaloy deformation and fracture in fuel element analysis.** Nichols, F.A. (Materials and Components Technology Div., Argonne National Lab., Argonne, IL 60439 (US)). pp 5-22 of Zirconium in the nuclear industry. Adamson, R.B.; Van Swam, L.F.P. Philadelphia, PA; ASTM (1987). (CONF-850601—).

From 7. international conference on zirconium in the nuclear industry; Strasbourg, France (24 Jun 1985).

A review is given of the comprehensive model developed in the 1960s at the Bettis Atomic Power Laboratory to explain the creep of Zircaloy during neutron irradiation and applied to fuel element analysis and design. The in-pile softening observed at low stresses was hypothesized to be due to a combination of the growth-directed Roberts-Cottrell yielding creep originally proposed for α-uranium and the formation of point defect loops preferentially on certain planes in response to the applied stress, with the second process being of relatively greater importance. The in-pile hardening observed at high stresses (or strain-rates) was proposed to be due to the cutting by dislocations of radiation-produced obstacles. In this stress (strain-rate) region, in-pile behavior was proposed to be identical to post-irradiation behavior. At intermediate stresses (strain-rates) a mechanism of radiation-enhanced climb around obstacles was suggested as being rate-controlling. As the stress is decreased, the climb process becomes easier, and the rate was then predicted to be controlled by glide at a flow-stress characteristic of unirradiated, annealed material, where radiation-enhanced diffusion enabled climbing around the normal strain-hardening obstacles. At still lower stresses, this glide process became negligibly slow compared with the growth-connected creep mechanism that was presumed to operate independently. The overall scheme was shown to be in good agreement with all the in-pile data then available and implemented into the computer analysis of fuel element behavior.

36830 **On the possible diversity of massive transformations.** Caretti, J.C. (I.M.A.F. (Facultad de Matematica, Astronomia y Fisica), Universidad Nacional de Cordoba, Laprida 854, 5000 Cordoba (AR)). *Acta Metallurgica;* **34**: No. 3, 385-394(Mar 1986).

Some features involved in the characterization of massive transformations are the crystallographic orientation relationships (OR) between matrix and product phase crystals, aspects of nucleation and growth, and the grain structure of product phases. No particular crystallographic OR seems to exist in Cu-Ga between a given matrix β crystal and the zeta/sub m/ product phase crystals nucleated within the bulk volume of the former. Only those nuclei having portions of non-coherent interfaces are likely to grow. An anisotropy in properties of the different product phase grain boundaries and migrating interfaces leads to a possible explanation for such different grain structures as the bubble-shaped pattern in Ag-Ga, and irregular pattern in Cu-Ga. It is concluded that the kinetics of atomic transfer across interfaces seems to be the most important single factor affecting the crystallographic features of nucleation. The structure and energy of product phase grain boundaries is an important factor affecting the morphology of transformation products.

36831 **High temperature creep and fracture properties of a class I solid solution alloy: Cu-2.7 at.%Sn.** Wang, J.S.; Nix, W.D. (Dept. of Materials Science and Engineering, Stanford Univ., Stanford, CA (US)). *Acta Metallurgica;* **34**: No. 3, 545-556(Mar 1986).

The high temperature creep and fracture properties of a class I solid solution alloy, Cu-2.7 at.%Sn, have been investigated. The alloy behaves as a class I solid solution in the normalized stress range: $1 \times 10^{-4} < \sigma\mu < 2.5 \times 10^{-3}$. Above $\sigma\mu = 2.5 \times 10^{-3}$ power law breakdown occurs whereas below about $\sigma\mu = 1 \times 10^{-4}$ the alloy exhibits class II creep behavior. In spite of the viscous nature of dislocation motion in the class I regime, the alloy fractures in an intergranular manner by cavitation along grain boundaries. However, creep ductility reaches a maximum in this regime; it decreases at both higher and lower stresses in the power law breakdown and class II creep regimes, respectively. In class I regime both creep ductility and creep strength are higher than for pure Cu. Thus, it is possible to increase both strength and ductility by forming a class I solid solution. The higher ductility is explained in terms of the difficulty of intergranular cavity nucleation.

36832 **A universal temperature scale for plastic flow.** Mecking, H.; Nicklas, B.; Zarubova, N.; Kocks, U.F. (Arbeitsbereich Werkstoffphysik und -technologie, Technische Universitat, 2100 Hamburg-Harburg (DE)). *Acta Metallurgica;* **34**: No. 3, 527-536(Mar 1986).

The strain-hardening of pure f.c.c. metals at intermediate and high temperatures is compared by analyzing the steady-state limit for <111> single crystals. The influence of the stacking-fault energy could be quantitatively accounted for by scaling the stress and temperature axes by a material dependent factor; this brought the curves for Al, Cu, Ni and Ag into coincidence for all temperatures, at a strain rate of $4 \cdot 10^{-4}\ s^{-1}$. No deviation from this universal behavior could, for example, be detected for Ag at 0.95 T/sub m/ (T/sub m/ = melting temperature), which corresponds to Al at 0.65 T/sub m/. To account for the strain-rate dependence in Al, an Arrhenius law with a stress dependent pre-exponential (exponent 3.7) led to a limiting activation energy compatible with that for self-diffusion. If this compatibility is forced onto the other materials, varying pre-exponential stress laws must be postulated. The behavior of all materials up to about 0.6 T/sub m/ follows the low-temperature description. It is concluded that dynamic recovery is influenced most significantly by dislocation rearrangements that do not require diffusion.

36833 **A simple model for the prediction of coherent and semicoherent plate precipitate habit planes.** Dahmen, U.; Westmacott, K.H. (National Center for Electron Microscopy, Materials and Molecular Research Div., Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). *Acta Metallurgica;* **34**: No. 3, 475-482(Mar 1986). Contract AC03-76SF00098.

A quantitative physical description of the process that determine plate precipitate habit planes evolves when a transformation with strains of mixed sign is modelled as a tensile test. The tensile axis, and with it the habit plane, is determined by elastic anisotropy in the coherent case and by slip geometry in the semicoherent case. The physical connection lies in the different constraints imposed by elastic or plastic yielding. Examples of application of the principles and comparisons with experimental observations are given.

36834 **Determination of dispersoid size distributions in Inconel MA 754 by small-angle x-ray scattering.** Stephens, J.J.; Spooner, S. (Dept. of Materials Science and Engineering, Stanford Univ., Stanford, CA (US)). *Acta Metallurgica;* **34**: No. 2, 303-312(Feb 1986).

The disperzoid size frequency distribution and volume fraction of the nickel based oxide dispersion strengthened alloy have been determined using small-angle X-ray scattering (SAXS). The results lead to predicted dislocation creep strengths which are in reasonable agreement with short time creep data at 1000 and

1093°C. The effect of mixed aluminum-yttrium oxides is considered.

36835 **Continuous indentation test for metals.** Jaramillo, D.V.; Kuriyama, S.; Meyers, M.A. (Dept. of Metallurgical and Materials Engineering, New Mexico Institute of Mining and Technology, Socorro, NM (US)). *Acta Metallurgica;* 34: No. 2, 313-324(Feb 1986).

A penetration test using a continuously increasing load applied on a knife-edge indenter (30° angle) is described. The advantage is that the applied load is continuously recorded as a function of penetration depth. Ni-200 and 70/30 brass with varying plastic deformation responses produced by different cold rolling and annealing schedules were studied. The finite element method was applied to model plastic deformation under the indenter and predict the load versus depth-of-penetration curves. A linear relationship between the applied load and penetration depth was found experimentally and by computer simulation.

3602 Ceramics, Cermets, And Refractories

36836 **(AD-A—189937/6/XAB) High-temperature photoelectron spectroscopy.** Dyke, J.M.; Ellis, A.M.; Feher, M.; Morris, A.; Paul, A.J. (Southampton Univ. (UK). Dept. of Chemistry). 1987. 12p. NTIS, PC A03/MF A01.

Pub. in Jnl. of Chemical Society, Faraday Translation 2, Vol. 83, No. 8, 1555-1565(1987).

The HE I photoelectron spectra of NbO and TaO have been recorded. In both cases, four main bands were observed that can be attributed to ionization of the isolated metal monoxide molecule. Bands associated with other oxides or the metal were not observed. Assignment of the photoelectron spectra of NbO and TaO was made with the aid of Hartree-Fock-Slater (HFS) calculations and by comparison with the known photoelectron spectrum of VO. The first adiabatic ionization energies of NbO and TaO were measured as 7.91 + or - 0.2 eV and 8.61 + or - 0.02 eV, respectively. Suggestions are made to explain the poor agreement between previous mass-spectrometric values for the first ionization energy of each oxide.

36837 **(AD-A—190100/8/XAB) Fluoride glasses from sol gels. Final report.** Uhlmann, D.R. (Massachusetts Inst. of Tech., Cambridge (USA)). 15 Sep 1986. 7p. NTIS, PC A02/MF A01.

Availability: Document partially illegible.

The use of sol-gel coatings to strengthen oxide glasses was demonstrated for the case of fused silica. Increases in strength to as much as 2.2 times the strength of uncoated glass were obtained. The strengthening does not involve the annealing of surface microcracks, but rather the filling-in of such flaws. The strengthening does not depend on coating thickness over the range 2000-10000 Angstroms, but does depend significantly upon the state of hydrolysis of the substrate surface.

36838 **(AD-A—190259/2/XAB) High-temperature superconductivity. Final report.** Osofsky, M. (Naval Research Lab., Washington, DC (USA)). 14 Dec 1987. 18p. NTIS, PC A03/MF A01.

After the initial discovery of superconductivity over 30K in the La_2-XBaXCuO$_4$ system several groups confirmed the result both resistively and magnetically (flux expulsion). Ultimately, transitions were observed in the analagous compounds with Ba replaced with Ca7 and Sr7,8 for $0.1 \leqq x \leqq 0.3$ with the highest Tc's above 40K. The author's samples were prepared from reagent-grade powders of La_2O_3, $BaCO_3$, $SrCO_3$, $CaCO_3$, PbO_2, and CuO. The powders were mixed in inappropriate ratios and calcined in air between 1000 and 1100C for 12 hours. The resulting materials were reground, pressed into small disks (nominally 1 cm diameter by 2 mm height) and sintered in air at 1000-1100C for 12h. The calcined powders and sintered pellets were x-rayed following each process to ensure that the proper phase was present.

36839 **(AD-A—190340/0/XAB) Temperature-dependent conductivity of oxygen-depleted YBaCuO ceramics. Technical report.** Miller, J.H.; Liu, B.; Riley, W.J.; DiBianca, A.N.; Holder, S.L. (North Carolina Univ., Chapel Hill (USA). Dept. of Chemistry). 9 Jan 1988. 11p. (TR—29). NTIS, PC A03/MF A01.

The electrical conductivity of the oxygen-depleted material YBa$_2$Cu$_3$O/sub 6.4/ was determined as a function of temperature. The conductance is more accurately described as variable range hopping between localized states than as activated conductivity characteristic of a semiconductor.

36840 **(AD-A—190712/0/XAB) Strength and microstructure of ceramics. Annual report, 1 October 1986-30 September 1987.** Lawn, B.R.; Swanson, P.L.; Fairbanks, C.J.; Hockey, B.J.; Mai, Y.W. (National Bureau of Standards, Washington, DC (USA). Ceramics Div.). Nov 1987. 38p. NTIS, PC A03/MF A01.

The goal in this program continues to be the understanding of the role of microstructure in the strength properties of ceramics. It is becoming increasingly apparent to the brittle-fracture community that the toughness characteristics and flaw distributions of structural ceramics can be very much influenced, sometimes with great sensitivity, by small details in the microstructural makeup. For instance, the addition of less than 1% glassy phase to the grain boundaries of alumina polycrystals can alter the fracture properties dramatically, giving rise to significant improvements in strength.

36841 **(AD-A—190713/8/XAB) Magnetic anomalies in the rare earth oxide superconductors GdBa$_2$Cu$_3$O/sub 7-x/ and YBa$_2$Cu$_3$O/sub 7-x/. Technical report.** Hatfield, W.E.; Rohrs, B.R.; Kirk, M.L.; Helms, J.H.; Ro, H. (North Carolina Univ., Chapel Hill (USA). Dept. of Chemistry). 9 Jan 1988. 12p. (TR—3). NTIS, PC A03/MF A01.

The magnetic properties of GdBa$_2$Cu$_3$O/sub 7-X/ and YBa$_2$Cu$_3$O/sub 7-X/ were studied in low applied magnetic field by using pelleted sample. The magnetic behavior may be explained by the occurrence of a spin-glass state due to a granular superconductor. The model assumes superconducting grains which are small compared to the penetration depth, and these are coupled into closed loops. Cooling in zero-field, followed by the application of a field at a fixed temperature produces a metastable state resulting in frustration and spin-glass behavior.

36842 **(AERE-G—4651) Preparation of neptunium oxide spheres for use in neutron dosimetry.** (UKAEA Harwell Lab. Chemistry Div.). Feb 1988. 17p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753981/JAW.

Dense spheres of neptunium oxide have been prepared, by a gel precipitation process, for use in neutron dosimetry. The spheres were of 500 and 800 μm diameter.

36843 **(AERE-R—11773) Transient gas release from irradiated UO$_2$: specimen characterisation and experimental methods.** Small, G.J. (UKAEA Harwell Lab. Materials Development Div.). Nov 1987. 39p. H.M. Stationery Office, London, price Pound 5.00.

A programme of experiments is underway to investigate the release of ^{85}Kr gas from thermal reactor fuel during post-irradiation annealing. In the first series of tests specimens were sealed in small capsules and the integrated release was determined after the anneal by puncturing. Subsequent experiments have been carried out with helium flowing over the specimens continuously, allowing the release of ^{85}Kr to be monitored on-line. The report outlines the origin of the samples and describes various techniques and items of equipment developed specifically for the programme. A comprehensive programme of post-test examination has been devised to extract as much information as possible on the distribution of retained gases between inter-granular bubbles, intra-granular bubbles and solution in the matrix.

36844 (BNL—40954) High temperature zirconium carbide coatings for use in particle bed reactors. Horn, F.L.; Powell, J.R. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 19p. (CONF-880488—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007973/JAW.

From 15. international conference on metallurgical coatings; San Diego, CA, USA (11 Apr 1988).

The Particle Bed Reactor is composed of one-half millimeter in diameter nuclear fuel particles held in a fixed bed configuration by frits and cooled by a gas flowing through the bed and frits. The operating temperature of the reactor is in the 1500 to 3000{degree}K range depending upon its projected use. The gas coolant may be an inert gas for closed cycle systems, hydrogen, or decomposed ammonia for open cycle propulsion systems. The high temperature ~2500{degree}K hydrogen system requires a coating on the frits and fuel particles that will not react with hydrogen. Zirconium carbide particles (1/2 mm) were tested at 2000{degree}K in flowing hydrogen gas for twelve hours with little or no reaction (<0.1% weight loss). They also showed no visible surface change under the microscope. Test fuel is being coated with zirconium carbide by the zirconium chloride vapor reaction process. Test frits made by the carbon fiber-carbon composite method have been made and will be coated with zirconium carbide and incorporated in the full-sized fuel element. 5 refs., 12 figs.

36845 (BNL—41304) Modification of YBa_2Cu_3O/sub 7-x/ ceramics by adsorbed water and other gases. Ruckman, M.W.; Chen, D.H.; Moodenbaugh, A.R.; Heald, S.M.; Qiu, S.L.; Lin, C.L.; Strongin, M.; Nichols, D.; Crow, J.E. (Brookhaven National Lab., Upton, NY (USA); Temple Univ., Philadelphia, PA (USA). Dept. of Physics). 1988. Contract AC02-76CH00016. 13p. (CONF-880519—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011518/JAW.

From 4. northeast regional meeting on processing and applications of high {Tc} superconductors; New Brunswick, NJ, USA (9 May 1988).

Surface modification of vacuum scraped YBa_2Cu_3O/sub 7-x/ (x=0,1) by H_2O, CO, CO_2 and O_2 was studied using photoemission and the modification of bulk $YBa_2Cu_3O_7$ and YBa_2}Cu_3O/sub 6.25/ by liquid water was studied using x-ray absorption. Photoemission measurements show that H_2O reacts with the surface by dissociating to form a surface hydroxide. CO and Co_2 form surface compounds that may be carbonates. Molecular oxygen dissociates and readily enters the bulk after adsorption on oxygen-deficient material. The x-ray diffraction and absorption studies show that H_2O readily reacts with oxygen deficient material and completely disrupts it. $BaCO_3$ and a CuO-like phase are detected. $YBa_2Cu_3O_7$ is more stable and was not disrupted. Modifiction of the Cu K-edge and EXAFS resemble those seen when the material reacts with H_2 and this suggests that hydrogen may be produced during the surface reaction with water and may react with the bulk material. 34 refs., 8 figs.

36846 (CEA-CONF—8980) Reactive magnetron sputtering of titanium nitride: analysis of the deposition process. Danroc, J.; Aubert, A.; Gillet, R. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Dept. de Metallurgie). Mar 1987. 8p. (CEA-DMG—10-87; CONF-8703154—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88752555/JAW.

From International symposium on trends and new applications in thin films; Strasbourg, France (16 Mar 1987).

Pumping rate and gas inlet position are important parameters for elaboration of thin films of zirconium and titanium nitrides. It is observed generally that when partial pressure of nitrogen increases progressively in the plasma, total pressure increases abruptly in the enclosure. This phenomenon reversible with hysteresis, due rapid nitride formation on the target should be weaken for a better operation. It can be obtained by positioning the nitrogen inlet near the pumping system and/or in increasing pumping rate.

36847 (CEGB-TPRD/B—0957/R87) Surface analysis using X-ray photoelectron spectroscopy and X-ray diffraction of UO_2 fuel pellets oxidised in air at 230°C and 270°C. Tempest, P.A.; Tyler, J.W. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Aug 1987. 41p. (BPC/P—87-248-Rev.). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753604/JAW.

Factors which affect the UO_2 -> U_3O_8 transformation have been investigated by sequentially oxidising UO_2 fuel pellets in air at 230°C and 270°C and monitoring the growth of U_3O_7 and U_3O_8 using X-ray photoelectron spectroscopy, X-ray diffraction and scanning electron microscopy. Initially oxidation proceeded at a linear rate by the inward diffusion of oxygen to form a complete layer of sub-stoichiometric U_3O_7. This phase was tetragonal with a ca ratio of 1.015, significantly less than the value of 1.03 measured on UO_2 powder when oxidised under identical conditions. This difference and the preferred orientation exhibited by surface grains were caused by growth stresses induced in the pellet surface. Both intergranular and transgranular cracking occurred and became nucleation sites for the growth of U_3O_8. The linear oxidation period associated with U_3O_7 growth was much shorter at 270°C than 230°C and U_3O_8 nucleated earlier. Spallation and the production of particulate were only observed during the formation of U_3O_8 when a 30% increase in volume arose from the U_3O_7 -> U_3O_8 phase change.

36848 (CONF-870843—11) The polymorphic transformations of zirconia. Chan, S.K. (Argonne National Lab., IL (USA)). 1987. Contract W-31109-ENG-38. 27p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009985/JAW.

From International conference on electronic structure in phase stability in advanced ceramics; Argonne, IL, USA (17 Aug 1987).

The polymorphic transformations of zirconia are elucidates as displacive transformations originating from the softening or partial softening of appropriate elastic constants. From expansions of the free energy in powers of symmetry-adapted homogeneous strains, all the possible symmetry and thermodynamically allowed tranformation paths staring from the cubic and tetragonal parent phases are obtained. It is found that transformations that start from the cubic parent phase involve cubic variants and are necessarily of a discontinuous (first order) nature because of symmetry. However, transformations that start from the tetragonal parent phase do not involve cubic invariants. They can be of a discontinuous or continuous (higher than first order) nature depending on whether the fourth order invariants are negative or positive. 18 refs., 2 tabs.

36849 (CONF-880118—5) Interface modification in Nicalon/SiC composites. Lowden, R.A.; Stinton, D.P. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 28p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009708/JAW.

From 12. annual conference on composites and advanced ceramic materials; Cocoa Beach, FL, USA (20 Jan 1988).

Improved mechanical behavior in Nicalon/SiC composites has been produced by controlling the interfacial bond through coating of the fibers with thin films before densification. Varying degrees of bonding have been achieved with different coating materials and film thicknesses. The effects of bonding on fiber pull-out, and thus mechanical behavior, have been investigated. Fiber-matrix bond strengths have been semi-quantitatively evaluated using indentation methods and a simple tensile test. Electron microscopy and surface analysis were utilized to characterize interface compositions and structures. These results have been used to further examine fiber-matrix interfaces and their influence on mechanical behavior. 37 refs., 9 figs., 1 tab.

36850 (CONF-880118—6) Application of magnification xeroradiography to advanced ceramics. Kriz, R.J.; Ellingson, W.A. (Illinois Univ., Chicago (USA). Dept. of Radiology; Argonne National Lab., IL (USA)). Feb 1988. Contract W-31109-ENG-38. 19p. (CONF-880118—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009965/JAW.

From 12. annual conference on composites and advanced ceramic materials; Cocoa Beach, FL, USA (20 Jan 1988).

Low-density inclusions and voids in ceramics present a detection problem to X-ray imaging because of the relatively low contrast in the resulting image. An X-ray imaging technique called xeroradiography has been in use for medical applications for detecting calcifications (low-density inclusions) in breast tissue. The method has a {open+-quotes}built-in{close+-quotes} edge enhancement. We have applied this technique to green and densified Si_3N_4 specimens and have shown initial improvements over other X-ray methods in detection of seeded defects. 7 refs., 5 figs., 1 tab.

36851 (CONF-880182—1) Ceramic processing of high-T/ sub c/ superconductors. Poeppel, R.B.; Singh, J.P.; Lanagan, M.T.; Goretta, K.C.; Dusek, J.T.; Capone, D.W. II. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 4p. NTIS, PC A02;3. Order Number DE88010090/JAW.

From SPIE conference on superconducting materials and instruments; Los Angeles, CA, USA (10 Jan 1988).

The means by which superconducting YBa_2Cu_3O/sub 7{minus/x} powders can be synthesized are summarized. Methods of forming powders into useful shapes are then described. Lastly, heat treatment schedules used for consolidation of the powders into dense, sound bodies with good superconducting properties are discussed. 19 refs.

36852 (CONF-880206—12) The superconducting transition in oxygen deficient YBa_2Cu_3O/sub 7-δ/. Claus, H.; Crabtree, G.W.; Kwok, W.K.; Veal, B.W. (Illinois Univ., Chicago (USA). Dept. of Physics; Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 2p. (CONF-880206—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009957/JAW.

From International conference on high temperature superconductors and materials and mechanisms of superconductivity; Interlaken, Switzerland (29 Feb 1988).

In this paper we compare the superconductive transition of several oxygen deficient samples measured inductively to that measured resistively and point out important systematic differences between the results of the two types of measurements. Fully oxygenated samples were prepared. The oxygen stoichiometry was reduced by heat treatment at 500{degre}C for 22 hours in an O_2Ar mixture containing various amounts of O_2 flowing over the sample. Samples were then quenched in liquid nitrogen to prevent any change in the oxygen stoichiometry upon cooling. The oxygen content of the samples was determined by weighing. Superconducting transition temperatures were determined by magnetic shielding measurements in a low field SQUID magnetometer in fields of 2 Gauss. The measurements were carried out by cooling the sample to 4.2 K in zero field, applying the measuring field and taking data on warming. Resistivity measurements were made by the four probe ac technique at frequency of 100 Hz and with a measuring current of 1.5mA. 2 refs., 3 figs.

36853 (CONF-880207—2) Superconducting properties of oxygen deficient YBa_2Cu_3O/sub 7-δ/. Kwok, W.K.; Crabtree, C.W.; Veal, B.W.; Claus, H. (Argonne National Lab., IL (USA); Illinois Univ., Chicago (USA). Dept. of Physics). Feb 1988. Contract W-31109-ENG-38. 7p. (CONF-880207—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009969/JAW.

From Discussion meeting on high-{Tc} superconductors; Mauterndorf, Austria (7 Feb 1988).

An important and interesting feature of the high temperature superconductor YBa_2Cu_3O/sub 7{minus/δ} is the dramatic effect of oxygen vacancies on its superconducting properties. As oxygen is systematically removed from the structure, the orthorhombic distortion decreases and the system undergoes a structural transition to a tetragonal phase. Simultaneously, T/sub c/ falls monotonically, with superconductivity disappearing at approximately the stoichiometry where the orthorhombic-to-tetragonal structural transition occurs. The curve of T/sub c/ versus δ shows two regions of stable superconductivity where T/sub c/ is not a strong function of δ. For δ near zero, there is a nearly flat region where T/sub c/ is close to 90{degree}K and for .35 < δ <.45 there is a plateau where T/sub c/ remains constant at approximately 60{degree}K. The width of the inductive transition in these two regions is narrow suggesting that the superconductivity is due to a homogeneous well defined phase. In order to investigate the mechanisms and properties of superconductivity in YBa_2Cu_3O/sub 7{minus/δ} it is necessary to characterize and compare the superconducting behavior in these two phases. In this paper we present resistivity and magnetization data from which we determine the upper critical field H/sub c2/ and compare the relative pinning strengths of polycrystalline samples with δ = 0.04 and 0.4. 18 refs., 4 figs.

36854 (CONF-880207—3) Anisotropy of the lower critical field in YBa_2Cu_3O/sub 7 {minus/δ}. Umezawa, A.; Crabtree, G.W.; Liu, J.Z.; Nunez, L.H. (Argonne National Lab., IL (USA)). Feb 1988. Contract W-31109-ENG-38. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009971/JAW.

From Discussion meeting on high-{Tc} superconductors; Mauterndorf, Austria (7 Feb 1988).

We report the first careful measurements of the two dimensional anisotropy of the lower critical field H/sub c1/. We compare the anisotropy in our values of H/sub c1/ with the anisotropy observed in H/sub c2/ and derive values for the anisotropy of the effective mass. The single crystals used in this study were grown by a solid state annealing method. Y_2O_3, $BaCO_3$, and CuO powders were mixed in the stoichiometric 1:2:3 ratio, ground with a mortar and pestle, placed in a platinum crucible and heated to 975{degree}C for 3–5 days. The reaction product contained many small crystals up to typical dimensions of 0.5 mm. The crystals showed a sharp inductive onset at 91.5{degree}K as measured in a dc shielding experiment in a field of 10 Oe. In general the crystals were not oxygen annealed before measurement. Three crystals were selected for measurements of H/sub c1/. One of the crystals was used as-grown, one was annealed for 24 hours at 500{degree}C in a pure oxygen environment, and one was irradiated with neutrons to a fluence of 8.16 {times} 10^{17} neutronscm^2. Results are discussed. 10 refs., 4 figs., 1 tab.

36855 (CONF-880207—4) Effect of neutron irradiation on critical magnetization current in single crystal YBa_2Cu_3O/sub 7-δ/. Weber, H.W.; Crabtree, G.W.; Umezawa, A.; Liu, J.Z.; Nunez, L.H. (Argonne National Lab., IL (USA)). Feb 1988. Contract W-31109-ENG-38. 6p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009970/JAW.

From Discussion meeting on high-{Tc} superconductors; Mauterndorf, Austria (7 Feb 1988).

We have found that critical magnetization currents can be increased through irradiation with fast neutrons. Radiation fluences of up to 8.16 {times} 10_{17} ncm/sup {minus/2} give critical magnetization current enhancements of up to 280% at 77{degree}K. The critical current enhancement at 77{degree}K is greater than that at 45{degree}K at all fields. Above 45{degree}K both the irradiated sample and the unirradiated sample show fairly low anisotropy in their flux pinning, less than a factor of eight. The dependence of the superconducting transition temperature with neutron fluence was found to be {minus}2.6 $K10^{18}$ ncm/sup {minus/2} implying that higher fluences can be used to study the effect of defects on the critical magnetization currents in single crystals. 11 refs., 3 figs., 1 tab.

36856 (CONF-880207—6) Pure metallic bridge and point-contact tunneling into single- and polycrystal YBa_2Cu_3O/sub 7-y/. Gray, K.E.; Moog, E.R.; Hawley, M.E. (Argonne National Lab., IL (USA)). Jan 1988. Contract W-31109-ENG-38. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010030/JAW.

From Discussion meeting on high-{Tc} superconductors; Mauterndorf, Austria (7 Feb 1988).

It is known theoretically and experimentally that when the resistance of a point-contact is decreased the current-voltage characteristic, I(V), changes from that of an insulating barrier to that of a pure metallic bridge. Such an I(V) still shows the energy gap but, because of its much lower resistance, it is less sensitive to extraneous conduction mechanisms. Values of between 25 and 35 MeV are reported here for YBa_2Cu_3O/sub 7-y/, and these are in agreement with our results for low-resistance point-contact tunneling in both single- and poly-crystal samples. Examples of I(V) and the conduct-

ance, dIdV, will also be presented for pure metallic bridges as well as higher resistance point-contact tunneling. An electrically insulating layer is found on the surface of all samples, including single-crystals showing no evidence of impurities measured by Raman scattering. Consequently, contact of the tunneling tip is necessary to mechanically scrape, and thus clean, the surface before a measurable current can be obtained. Although this represents a disadvantage, a more serious drawback of point-contact tunneling is the inability to measure the I(V) continuously through the transition temperature, T/sub c/, due to thermal expansion of the mechanical apparatus. We will argue that thin film tunnel junctions are thus desirable both to unambiguously identify the energy gap with the 90{degree}K bulk material, and to subtract the background conductance to evaluate the electron coupling mechanism in the high-T/sub c/ superconductors(HTS), that is analogous to electron-phonon coupling in traditional superconductors. 17 refs., 2 figs.

36857 **(CONF-880210—2) Fabrication of bulk superconducting ceramics.** Goretta, K.C.; Dusek, J.T.; Singh, J.P.; Lanagan, M.T.; Balachandran, U.; Dorris, S.E.; Poeppel, R.B. (Argonne National Lab., IL (USA)). Mar 1988. Contract W-31109-ENG-38. 11p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009956/JAW.

From 1. world congress on superconductivity; Houston, TX, USA (22 Feb 1988).

Mixtures of ceramic powders and plastics can be formed into a variety of useful shapes, which for superconductors are most commonly tapes or wires. Procedures for processing monolithic ceramic superconductors and composite superconductors are described, and factors limiting the properties of these conductors and possible means of enhancing the properties are discussed. 20 refs., 3 figs.

36858 **(CONF-880317—2) Study of the friction and wear-related properties of ceramic superconductors.** Blau, P.J.; DeVore, C.E. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 12p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011844/JAW.

From ASM symposium on engineered materials for advanced friction and applications; Gaithersburg, MD, USA (1 Mar 1988).

The recent interest in high critical temperature (T/sub c/) superconductors has created a need to examine the tribological properties of these materials for defining potential applications and handling characteristics. This paper discusses preliminary information about the reciprocating sliding friction coefficients (self-mated and on gold), scratch resistance, microindentation hardness, and surface damage mechanisms in Y-Ba-Cu-O compounds. These compounds are fabricated in several ways including traditional powder compaction and solution-growing of single crystals. As expected, the materials are quite brittle, but Knoop microindentation hardness numbers for single crystals can exceed 4.41 GPa (450 kg/mm^2). Scratch resistance using a diamond-stylus test decreases with increasing load because intergranular and transgranular cracking increases with load. Friction coefficients on gold range from 0.12 to 1.0, depending on test duration, and those for self-mated sliding range between 0.15 and 1.1, also depending on test duration. Results suggest that the materials are brittle in their monolithic form, but that they show some ability to resist abrasion and sliding wear in a controlled environment.

36859 **(CONF-880408—22) Preparation of superconducting YBa_2Cu_3O/sub 7-x/ films by magnetron sputtering.** Kang, J.H.; Kampwirth, R.T.; Gray, K.E.; Wagner, A.; Huff, E.A. (Argonne National Lab., IL (USA)). Feb 1988. Contract W-31109-ENG-38. 3p. (CONF-880408—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009977/JAW.

From Spring meeting of the Materials Research Society; Reno, NV, USA (4 Apr 1988).

We have prepared thin films of YBa_2Cu_3O/sub 7-x/ by dc-magnetron sputtering from three separate metallic targets onto ambient temperature substrates of (100)$SrTiO_3$, (100) and random oriented ZrO_2-9%Y_2O_3, and (100)MgO. After annealing, the films grown on $SrTiO_3$ showed a mixture of a- and c- axis orientation while the films grown on ZrO_2 and on MgO were randomly oriented. The targets used in sputtering were either yttrium, barium and copper or yttrium, Ba_3Cu_5 and copper. The latter combination offered better control of the film composition because the CuBa ratio could be more accurately maintained and the target itself was more stable. To check the reproducibility of film composition, an Inductively Coupled Plasma --Atomic Emission Spectroscopy (ICP-AES) technique was employed to obtain average composition. Compositional variations in films produced under similar conditions are within 1--3% which was close to the instrumental resolution. 2 figs.

36860 **(CONF-880466—6) High-power rf applications of high-T/sub c/ superconductors.** Delayen, J.R.; Lanagan, M.T. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012055/JAW.

From Conference on superconductivity and applications; Buffalo, NY, USA (18 Apr 1988).

The rf surface resistance of YBa_2Cu_3O/sub 7-x/ was measured by a half-wave resonant coaxial line technique for bulk ceramic and thick film samples. The surface resistance was found to be dependent upon frequency, temperature, and rf field level. A comparison between design criteria for high power cavities and measured properties was carried out to determine the utility of the YBa_2Cu_3O/sub 7-x/ superconductor.

36861 **(CONF-880466—7) Ceramic fabrication technology for high-T/sub c/ materials.** Lanagan, M.T.; Goretta, K.C.; Singh, J.P.; Goudey, G.T.; Dusek, J.T.; Dos Santos, D.I.; Poeppel, R.B. (Argonne National Lab., IL (USA)). Apr 1988. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012060/JAW.

From Conference on superconductivity and applications; Buffalo, NY, USA (18 Apr 1988).

Three basic processes are discussed for the fabrication of high T/sub c/ superconductors. Superconducting wires of YBa_2Cu_3O/sub 7-x/ are fabricated by extrusion. Tape casting and thick film technology are utilized for the manufacture of YBa_2Cu_3O/sub 7-x/ and silver composite structures. Grain orientation is observed for extruded and tape cast specimens, which is attributed to high shear stresses during plastic forming.

36862 **(CONF-880488—5) Characterization of coating wear phenomena in nitride and carbide coated tool inserts.** Fenske, G.R.; Kaufherr, N.; Lee, R.H.; Kramer, B.M.; Bunshah, R.F.; Sproul, W.D. (Argonne National Lab., IL (USA); George Washington Univ., Washington, DC (USA); California Univ., Los Angeles (USA); Northwestern Univ., Evanston, IL (USA)). 1988. Contract W-31109-ENG-38. 14p. (CONF-880488—). NTIS, PC A03;3. Order Number DE88011196/JAW.

From 15. international conference on metallurgical coatings; San Diego, CA, USA (11 Apr 1988).

Hard nitride- and carbide- coatings of Ti, Zr, and Hf were deposited on T-15 cutting tool inserts using high-rate reactive sputtering (HRRS) and activated reactive evaporation (ARE) processes. The coated inserts were subjected to a series of metal cutting tests to evaluate their performance and to compare their relative ranking with wear model predictions. The cutting tests indicated the coated inserts outperformed uncoated inserts by a factor of 2- to 10 depending on the coating process and composition; however their ranking based on measured lifetime (to reach a 0.003 in. crater depth) did not agree with predicted wear model predictions. Subsequently, a series of short-term cutting tests were initiated to study the wear behavior of the coatings during the early stages of the wear process when the coating was still intact. Post-test examination of the inserts suggest that the predominant wear mechanism was not due to abrasion or thermochemical dissolution as predicted by the model, but was a result of substrate softening followed by microfracture of the coating. The substrate softening is attributed to the severe cutting conditions (325 sfpm under dry cutting conditions) used in the cutting tests. 12 refs., 5 figs., 1 tab.

36863 **(CONF-880504—2) Phase transformations and thermodynamic behavior of the YBa_2Cu_3O/sub x/ system via EMF measurements.** Tetenbaum, M.; Brown, A.; Blander, M. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 13p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010054/JAW.

From 90. annual meeting of American Ceramic Society; Cincinnati, OH, USA (1 May 1988).

EMF measurements of oxygen fugacities as a function of stoichiometry in YBa_2Cu_3O/sub x/ were made in the temperature range 650-750{degree}C by means of an oxygen titration technique with a ZrO_2 electrolyte doped with Y_2O_3. From plots of equilibrium oxygen pressures versus x, no sign of a change in curvature or discontinuity was observed at an oxygen stoichiometry of x = 6.5 where copper is divalent. A change in slope was observed when x {approximately}6.3. The EMF measurements were extended to an oxygen stoichiometry of x = 6.15; after slow cooling to room temperature, x-ray examination of the samples indicated that the original orthorhombic phase was completely transformed to tetragonal. A rapid increase in the partial molar entropy of oxygen, Δ{ovr S}/sub O{sub 2/}, was found in the composition range x = 6.3 to 6.15. The increase in Δ{ovr S}/sub O{sub 2/} values appears to reflect the differences between distributions of oxygen atoms and vacancies in the relatively disordered tetragonal structure and the more ordered orthorhombic structure. The results to date indicate that the important orthorhombic structure can exist over an extended oxygen composition range, namely, {approximately}6.3-7.0 at temperatures in the range of 650-750{degree}C. 10 refs., 5 figs., 1 tab.

36864 **(CONF-880504—3) Superconducting properties of $LaBa_2Cu_3O$/sub x/ and YBa_2Cu_3O/sub y/.** Balachandran, U.; Goretta, K.C.; Shi, D.; Poeppel, R.B.; Eror, N.G. (Argonne National Lab., IL (USA); Oregon Graduate Center, Beaverton (USA)). Apr 1988. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012038/JAW.

From 90. annual meeting of American Ceramic Society; Cincinnati, OH, USA (1 May 1988).

The liquid-mix technique has been used to synthesize powders of $LaBa_2Cu_3O$/sub x/ and YBa_2Cu_3O/sub y/. The powders were then pressed into pellets and sintered. After annealing in oxygen, specimens from both materials exhibited sharp drops in resistivity at 90K. The Y-based material reached zero resistivity at about 86 K, regardless of the cooling rate from the sintering temperature. The La-based material required rapid cooling and relatively short anneals to achieve onset of superconducting at 90 K, but zero resistivity was not obtained above 77 K.

36865 **(CONF-880724—19) An investigation of ceramic coatings for protection of SiC from high-temperature corrosion.** Federer, J.I. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 11p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011023/JAW.

From 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference; Houston, TX, USA (24 Jul 1988).

Silicon carbide ceramics are susceptible to corrosion by certain industrial furnace environments. This behavior would limit the use of SiC components in ceramic heat exchangers. Because oxide ceramics corrode substantially less in the same environments, ceramic coatings have been investigated for corrosion protection. Coatings with Al_2O_3, SiO_2, or ZrO_2 as the main constituent were applied to sintered alpha and recrystallized (CS101) SiC substrates. The coated specimens were thermally cycled between room temperature and 1200{degree}C as a test of adherence. Some coatings adhered better to the inherently rougher CS101 SiC; however, most coatings did not adhere to either substrate. Two Al_2O_3-based coatings contained cracks, but remained intact during thermal cycling, and two ZrO_2-based coatings were subjected to corrosion testing at 1200{degree}C in an oxidizing atmosphere containing Na_2CO_3. None of these four coatings exhibited the desired corrosion resistance in this test. Coated samples, however, corroded less than an uncoated sample, indicating that coatings can improve corrosion resistance.

36866 **(CONF-8706300—1) Magnetic studies of a 1-2-3 (Y,Gd)-Ba-Cu-oxide superconductor.** Collings, E.W.; Melling, P.J.; Swartz, S.L.; Smith, R.D.; Rayment, J.J.; Pechan, M.J.; Pardavi-Horvath, M. (Battelle Memorial Inst., Columbus, OH (USA); Miami Univ., Oxford, OH (USA); Ohio State Univ., Columbus (USA)). 1987. Contract FG02-86ER45281. 6p. (CONF-8706300—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010532/JAW.

From 7. international cryogenic materials conference; St. Charles, IL, USA (14 Jun 1987).

Magnetic susceptibility measurements have been conducted on a sample of the ceramic superconductor (Y/sub 0.5/Gd/sub 0.5/)$_1Ba_2Cu_3O$/sub y/ (YGBC, T/sub c/ = 92 K), the related compounds (Y/sub 0.5/La/sub 0.5/)$_1Ba_2Cu_3O$/sub y/ (YLBC) and $Y_1Ba_2Cu_3O$/sub y/ (YBC), and the starting oxides Y_2O_3, La_2O_3, and CuO. It is deduced that the S = 12 moment exhibited by the antiferromagnetic CuO (T/sub N/ = 560 K) is also present in YBC and YLBC and hence, presumably, in the YGBC. In the latter compound, any moment on the Cu is masked by the Gd's large moment (S = 72) which, according to both the susceptibility results and those of electron spin resonance studies which were also performed on the YGBC material, persists into the superconducting phase. Also reported are the results of vibrating sample magnetometer measurements taken under low-field-cycling conditions (about /sub {+-/ 80 gauss, mostly in the Meissner flux-exclusion regime) within the temperature range 4.2 K to about 87 K.

36867 **(CONF-8805134—1) The use of analytical electron microscopy in the study of ion implanted materials.** Sklad, P.S. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 8p. (CONF-8805134—1). NTIS, PC A02;3. Order Number DE88011386/JAW.

From Ion implantation and plasma assisted processes for industrial applications conference; Atlanta, GA, USA (21 May 1988).

Ion beam techniques are used extensively as a means of altering the surface-controlled properties of metallic, ceramic, and semiconductor materials. In most cases the depth of implantation is limited to one or two micrometers. Determination of the microstructural and compositional changes which occur in regions located within a few hundred nanometers of the surface is essential to the understanding of the mechanisms responsible for the observed property changes. Electron microscopy, particularly analytical electron microscopy (AEM), is ideally suited for this purpose. In addition to standard imaging and diffraction techniques, other AEM techniques which prove valuable are convergent beam electron diffraction (CBED), x-ray energy dispersive spectroscopy (EDS), and electron energy loss spectroscopy (EELS). These techniques allow direct measurement and quantification of the microstructure in terms of solute concentration profiles, second phase formation, lattice damage, crystallinity of the implanted layer, and changes produced by post-implantation annealing. The results of such analyses can be correlated with theoretical models, property measurements, and the results of complementary characterization techniques. A number of examples illustrating the application of AEM to the investigation of ion implanted materials are presented. 28 refs., 9 figs.

36868 **(CONF-8805147—1) Ion implantation and thermal annealing of high-T/sub c/ single crystals of YBa_2Cu_3O/sub x/.** White, C.W.; McCallum, J.C.; Boatner, L.A. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA)). May 1988. Contract AC05-84OR21400. 15p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012201/JAW.

From European Materials Research Society meeting; Strasbourg, France (31 May 1988).

Rutherford backscattering spectrometry (RBS) has been used to study the effects of ion implantation and thermal annealing on single crystals of YBa_2Cu_3O/sub x/. The structural disorder induced by ion implantation results in significant changes in the near-surface composition during subsequent thermal processing. Compositional changes in the near-surface region of the YBa_2Cu_3O/sub x/ single crystals were observed after annealing oxygen- or copper-implanted crystals at temperatures of 500°C or higher in various atmospheres. Unimplanted crystals are not affected by the identical processing conditions. Preliminary results show that sintered poly-

crystalline ceramic YB_2Cu_3O/sub x/ also undergoes compositional changes as a result of ion implantation and thermal annealing.

36869 (CRIE-W—86027) Thermophysical properties of ceramics (1). Development of new measurement apparatus and results of test run for standard test piece. Takahashi, Tsuyoshi; Ishikawa, Hiroshi; Hamamatsu, Teruhide. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Apr 1987. 24p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752546/JAW.

An apparatus for measuring a thermal diffusivity, one of the thermophysical properties, of structural ceramics at ultra-high temperature was developed. As for the measurement principle, this apparatus utilizes a step-function heating method, where the thermal diffusivity is measured from the temperature dependence of the flat sample on the both sides, on the step heat flux applied to one side of the sample. For the transient heating, a carbonate laser is used. The measurement temperature range is from room temperature to 2300K. In contrast to a conventional method utilizing the temperature dependence of the unradiated face of the sample, the measurement by this apparatus is highly precise even at high temperatures, because of the less correction for the Fourier heat equation which is attributed to the low radiation heat loss. A novel program was prepared for the measurement, control and data analysis. The use of a multi-functional personal computer permitted the measurement from the step heating to the calculation of the thermal diffusivity to be completed in 5 - 6 minutes. The trial measurement on the tantalum standard sample proved the high abilities of this apparatus. (20 figs, 2 tabs, 7 refs)

36870 (CRN-CPR—87-07) Structural, magnetic and electronic properties of rare earth ternary oxides Li Ln(II) $_2$ Ln(III)O_4. Malki, M. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires). Jun 1987. 208p. (In French). NTIS (US Sales Only), PC A10/MF A01. Order Number DE88753942/JAW.

Properties of a new class of rare earth ternary oxides Li Ln(II)$_2$ Ln(III)O_4 where Ln(II) is a divalent metal (Sr, Eu) and Ln(III) a trivalent rare earth (Eu, Gd, Dy, Er and Y). These orthorhombic compounds (type Li Eu_3O_4) allow the study of many magnetic phenomena and their evolution in function of the nature of Ln(II) and Ln(III): diamagnetic ions Sr^{2+}, Y^{3+}; isotrope magnetic ions: Eu^{2+}, Gd^{3+} and anisotrope magnetic ions Dy^{3+}, Er^{3+}. Magnetic and electric properties are obtained by classical techniques and from hyperfine interaction by Moessbauer spectroscopy. The possibility to use several Moessbauer resonance (nuclei Eu 151, Gd 155, Dy 161 and Er 166) completes informations obtained by the macroscopic study.

36871 (DOE/DP/40200—70) Measurement of the thermal conductivity of dielectric thin solid films with a thermal comparator. Amsden, C.A.; Gilman, S.E.; Jacobs, S.D.; Torok, J.S. (Rochester Univ., NY (USA). Lab. for Laser Energetics). Apr 1988. Contract FC08-85DP40200. 5p. (CONF-880434—1). NTIS, PC A02/MF A01; GPO Dep. Order Number TI88008468/JAW.

From 4. topical meeting on optical interference coatings; Tucson, AZ, USA (12 Apr 1988).

Low thermal conductivity has important implications for electric and optical applications, where heat deposited in a thin layer must be dissipated to prevent damage. Models which account for thermal transport in thin film structures may have no predictive value if they employ bulk conductivity data. Most techniques utilized to measure the thermal conductivity of thin solid films are difficult and time consuming. The method we have developed is relatively rapid, nondestructive, and is capable of evaluating the samples in a conventional film on substrate geometry. Our thermal conductivity apparatus consists of a control and readout module, signal processing equipment, and an environmentally isolated sample chamber enclosing a sample stage. The commercial unit was converted into a high precision device by temperature controlling both the samples and the sample stage, and by performing averaging of the output signal. The thermal conductivity values obtained are below those of bulk solids. In addition, the conductivities seem to increase with increasing film thickness. Titania seems to have a higher thermal conductivity when deposited by ion-beam sputtering rather than electron-beam evaporation. Some of the electron-beam films were crazed, indicating high levels of stress. The effect of stress and crazing on thermal conductivity is not readily apparent. 11 refs., 1 fig., 1 tab.

36872 (DOE/ER—45307-1) Grain boundary nonstoichiometry in multicomponent ceramics: Technical progress report. Chiang, Yet-Ming. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Materials Science and Engineering). Jan 1988. Contract FG02-87ER45307. 8p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009888/JAW.

Objectives of this research program are to explore and understand detailed relationships between lattice defect chemistry, grain boundary defect chemistry, and properties of interest in multicomponent, nonstoichometric oxide systems. The model systems of greatest interest have been titanates including $SrTiO_3$ and $BaTiO_3$. We have added to these systems the high T/sub c/ cuprate superconductors, which are also multicomponent, nonstoichiometric solids, and in which grain boundary properties are increasingly seen to be primary limitations to attainment of useful properties (especially critical current). Thus, our present work focusses on both titanate and cuprate systems, and the relationship between grain boundary chemistry and (1) grain growth kinetics; (2) electrical barrier properties; and (3) superconducting properties (in the cuprates). Results and conclusions are summarized as follows: (1) Transitions in the grain growth rate as a function of donor concentration in both $SrTiO_3$ and $BaTiO_3$ involve distinct changes in mechanism. (2) When the lattice defect structure is altered via (i) changes in the AB cation stoichiometry; and (ii) varying donor concentration, there is a first-order effect on the composition and morphology of the second phase. Also, the composition of any second phase changes systematically with the overall donor concentration, and at the same time, the wetting behavior of the second phase changes. (3) At completely solid-state grain boundaries, there exist composition changes which are likely to influence the solute-drag mobility. Also, there are deviations in cation stoichiometry at the grain boundary (the boundary is strongly Ti-rich at high temperature equilibrium). 4 refs.

36873 (DOE/ER/02390—T3) Basic research in crystalline and noncrystalline ceramic systems. Kingery, W.D.; Flemings, M.C. Jr.; Dummer, G.H. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Materials Science and Engineering). May 1986. Contract AC02-76ER02390. 10p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011577/JAW.

Grain boundaries need to be studied in ceramics in order to be able to control their properties. Grain boundaries in MgO were found to offer a resistance to electronic mobility as a result of their negative charge, especially for n-type conductivity. Grain boundary ionic conductivity increases at high temperature in oxidizing (but not in reducing) atmospheres. The role of additives in the HT sintering and grain growth of SiC was studied. (DLC)

36874 (DOE/ER/45219—3) Defect characterization of the redox behavior and stability of conducting oxides. Anderson, H.U.; Howard, S.A.; Sparlin, D.M. (Missouri Univ., Rolla (USA)). [1988]. Contract FG02-85ER45219. 35p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010799/JAW.

Goal was to study the interrelationships between electrical conductivity, oxidation-reduction kinetics, defect structure, and composition of n- and p-type binary and ternary transition metal oxides. Experimental part included thermogravimet, x-ray diffraction, thermally stimulated current, oxygen diffusion, optical absorption, transmission electron microscopy, electrical conductivity, and Seeback effect. Systems studied were La-doped $SrTiO_3$, Mg-doped $LaCrO_3$, Mg-doped $LaMnO_3$, Sr-doped $LaMnO_3$, Nb-doped $LaCrO_3$, and Ba_2YCu_3O/sub 7-x/. Results show: 1) that at low oxygen activity donor $LaCrO_3$ is n-type, but becomes p-type as oxidation occurs; 2) the oxidation kinetics of both $LaCrO_3$ and $SrTiO_3$ are dominated by a rapid oxygen uptake followed by a slow uptake which can be attributed to a grain boundary type of process followed by volume diffusion; 3) DLTS and electrode probe measurements suggest that the 0.5eV defect state observed for $SrTiO_3$ is

probally due to the grain boundaries; 4) X-ray diffraction studies have revealed that the degree of cation imperfection in La-doped $SrTiO_3$ is directly related to the lattice strain; 5) Initial results for the Ba_2YCu_3O/sub 7-x/ system suggests that the electrical conductivity, hole mobility and thermoelectric power are more strongly dependent upon oxygen stoichiometry than upon temperature. 56 refs., 6 figs.

36875 (DOE/ER/45259—4) Band electronic structures and crystal packing forces: Progress report, July 1, 1987-February 9, 1988. Whangbo, M.H. (North Carolina State Univ., Raleigh (USA). Dept. of Chemistry). 9 Feb 1988. Contract FG05-86ER45259. 8p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010247/JAW.

Progress has been made in several aspects of our research on organic conducting salts, high temperature inorganic superconductors, and other low-dimensional materials. Band electronic structure study on the new ambient-pressure superconductor $(BEDT\text{-}TTF)_2Cu(NCS)_2$ (T/sub c/ = 10.4{degree}K) revealed that this salt is a two-dimensional metal. The $(BPDT\text{-}TTF)_3(INL_4)_2$ salt consists of BPDT-TTF molecules in two different oxidation states. Band electronic structure calculations on $(2,5\text{-}DM\text{-}DCNQI)_2Cu$ revealed that its metallic character must arise from the presence of copper atom mixed-valence (i.e., Cu/sup {+/}and Cu/sup {2+/}). Band electronic structure calculations were performed to examine the difference between the orthorhombic and tetragonal phases of YBa_2Cu_3O/sub 7-y/. We developed empirical atom-atom potentials that reproduce the crystal structure of binary oxides BaO, CuO, La_2O_3, and Y_2O_3. On the basis of our band electronic and empirical atom-atom potential studies, we proposed that linear electron-hole-electron pairing in Cu/sup {2 +/}--O--Cu/sup {3+/}--O--Cu/sup {2+/} units via concerted breathing-mode vibration is essential for the high-temperature superconductivity in La/sub {2-x/M/sub x/ CuO_4 and YBa_2Cu_3O/sub 7-y/. We also found that our empirical atom-atom potentials provide a reasonable set of ir and Raman frequencies for La/sub 2-x/M/sub x/CuO_4. 22 refs.

36876 (DPST—87-748) A method to fit and calculate P-C-T data of metal hydrides. Heung, L.K. (Savannah River Lab., Aiken, SC (USA)). 16 Oct 1987. Contract AC09-76SR00001. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011672/JAW.

The form of an equation for representing the pressure-composition-temperature (P-C-T) data of metal hydrides was discovered in the literature. I tried it for some of the isotherm data produced here and found it fit the data very well. After the coefficients of the equation have been defined, the equation can be used to interpolate and extrapolate within limits P-C-T equilibrium data, which had previously been done by drawing estimated best-fit isotherms. This equation will be useful for engineering calculations of hydride processes, especially in the α and β transition regions. This memo describes the equation and shows how it can be applied to our hydride systems. 1 ref., 1 fig.

36877 (DPST—88-498) Tritium storage effects on La-Ni-Al alloys: helium, and tritium trapping. Walters, R.T.; Mosley, W.C. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1988. Contract AC09-76SR00001. 21p. (CONF-8804146—2). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011666/JAW.

From Storage science meeting; Los Alamos, NM, USA (4 Apr 1988).

The use of La-Ni-Al metal hydrides to process and store tritium presents unique problems to the handling of tritium. All hydrogen isotopes are "trapped" in La-Ni-Al alloys as a function of homogeneity and the degree of activation, or number of full cycles the material experiences before being exposed to tritium. To a lesser extent, the mole fraction of aluminum has an effect on the number of cycles needed for full activation. Data is presented which shows the effect of La-rich second phases on the retentium of protium, the x-ray diffraction line broadening as a function of number of cycles, and the observed "heel" in the alpha region of the isotherm due to Ni-Al second phases. There also appears to be an increase in solubility of tritium due to the lattice expansion on the metal.

36880 (JINR-E—8-87-499) Experimental study of electric field influence on low temperature long-time relaxation in crystalline ferroelectrics. Sahling, S.; Kolac, M.; Sahling, A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1987. 19p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702913/JAW.

Submitted to the journal J. Low Temp. Phys. .

Calorimetric measurements with polycrystalline Pb/sub 0.915/La/sub 0.085/x(Zr/sub 0.65/Ti/sub 0.35/)O_3 were performed at helium temperatures in electric field E ($0 \leqq E \leqq 4.3$ kVcm). Heat release after cooling from T_1(1.3 K $\leqq T_1 \leqq$ 35 K) to T_0=1.3 K is very similar to that in amorphous metals and dielectrics. Experimental results disagree with the standard tunneling model. The observed release may be explained assuming the existence of a maximum energy is an element of/sub f/ in the distribution function. The maximum relaxation time tau/sub max/ was found as a function of T_1. A similar heat release is observed after switching on or off the electric field. In dependent of T for 1.1 K $\leqq T \leqq$ 3 K, proportional to E^2 with tau/sub max/ $\sim$ E. No heat release was observed in the KH_2PO_4 single crystal. 28 refs.; 7 figs.

36881 (KFK—4306) Preparation and behaviour of wear resistant coatings with a high amount of phase boundaries. Schulz, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung; Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Maschinenbau). Aug 1987. 183p. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number DE88753373/JAW.

The possibility to increase the toughness of wear-resistant coatings by introducing a high amount of phase boundaries in the coating were examined. Monolayer TiC-, TiN- and TiB_2-coatings, sequential TiC-TiN, TiC-TiB_2- and TiB_2-TiN-coatings with 10, 100, 250 500 and 1000 monolayers and simultaneous TiCTiB_2-coatings were sputtered on cemented carbides. The structure (constitution, structural fracture), the properties (hardness, toughness, residual stresses, adherence) and the wear behaviour at continuous and interrupted cutting conditions were examined. For comparison CVD-coated cemented carbides were also examined. The investigation of the influence of the annealing conditions on the properties and the wear behaviour of simultaneous TiCTiB_2-coatings has not been performed yet. On the sputtered phase boundary of sequential coatings a mixed phase is formed. The width of the mixing phase was evaluated to be 1 nm for TiB_2-TiN-coatings, 2 nm for TiC-TiB_2-coatings and 3-4 n for TiC-TiN-coatings. On the Ti, C, B- and Ti, N, B-mixing phase TiB_2 grows up to 5 and 10 nm in an amorphous state. A strong dependence of the toughness, determined by the crack formation and propagation at Vickers and Hertzian indentations, on the amount of phase transitions was detected for sequential coatings. 5 μm thick coatings with 100 to 250 phase transitions show favourable toughness properties. Those coatings also have a high resistance to flank wear and are superior to sputtered monolayer coatings and to CVD-coatings, especially at interrupted cutting conditions. (orig.IHOE).

36882 (LA-UR—88-642) Electron microscopy of ceramic superconductors. Mitchell, T.E.; Roy, T. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 7p. (CONF-880737—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88006446/JAW.

From 4. Asia-Pacific conference on electron microscopy; Bangkok, Thailand (26 Jul 1988).

The critical current Jc is at least as important as Tc (transition temperature) for applications in superconducting materials. Jc is strongly dependent on microstructure and, in consequence, electron microscopy will continue to be important in the development of practical ceramic superconductors. We will review the progress that has been made over the past year or so in studying the superconductors by electron microscopy techniques of all kinds–conventional, high resolution, analytical, etc. A thorough review is impossible but a bibliography is available, as well as two special issues of Journals. 25 refs., 9 figs.

36883 (LBL—23946) High-T/sub c/ superconductor and its use in superconducting magnets. Green, M.A. (Lawrence Berkeley Lab., CA (USA)). Feb 1988. Contract AC03-76SF00098. 69p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE88008403/JAW.

Many of the proposed uses for the high-T/sub c/ superconductor involve the creation of a magnetic field using superconducting coils. This report will assess what is known about the high-T/sub c/ superconductors and take a realistic look at their potential use in various kinds of superconducting magnets. Based on what is known about the high-T/sub c/ superconductors, one can make a "wish list" of things that will make such materials useful for magnets. Then, the following question is asked. If one had a high-T/sub c/ superconductor with the same properties as modern niobium-titanium superconductor, how would the superconductor work in a magnet environment? Finally, this report will show the potential impact of the ideal high-T/sub c/ superconductor on: 1) accelerator dipole and quadrupole magnets, 2) superconducting magnets for use in space, and 3) superconducting solenoids for magnetic resonance imaging. 78 refs., 11 tabs.

36884 (LBL—25010) Application of controlled interfacial pore structures to kinetic studies in alumina. Roedel, J.; Glaeser, A.M. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 8p. (CONF-8804112—4; CONF-8804112—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010884/JAW.

From Interfacial structure, properties and designs in solids; Reno, NV, USA (5 Apr 1988).

The application of controlled-geometry interfacial pore structures to fundamental kinetic studies in alumina is described. Results from studies of the morphological stability of high aspect ratio pore channels, crack healing, pore coarsening and pore elimination in sapphire are presented.

36885 (LBL—25165) Sintering of the heterogeneous MgO compacts. Lin, Mark Kin-Fu. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 109p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88010357/JAW.

This study explores the optimum sintering schedule for an agglomerate compact. Various pertinent models have been proposed to assess the influence of the multimodal pore size distributions on the overall densification kinetics and the effect of temperature on the sintered microstructure. A thorough investigation of the sintering behavior and microstructural evolution for the heterogeneous MgO compact has been performed. The enhancements of the densification rate, the grain growth rate, and the increase in interpore spacing while sintering the heterogeneous compacts have been observed in this study. High-temperature sintering tends to produce a heterogeneous structure, and many pores are trapped within the grains. Low-temperature sintering is advantageous to produce a more homogeneous structure. 2-step sintering, combining a pretreatment at low temperature (i.e., the homogenization treatment) with subsequent high temperature sintering, is proposed as an optimum sintering schedule for the agglomerated compact. 97 refs., 37 figs.

36886 (LBL—25340) Stability range of MoC (hP2). II. Thermodynamic properties of generalized Lewis acid-base intermetallics. Kouvetakis, J. (Lawrence Berkeley Lab., CA (USA)). May 1988. Contract AC03-76SF00098. 103p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE88011941/JAW.

The γ-MoC phase with the hexagonal WC structure was prepared without the presence of metal stabilizers at temperatures below 1000°C. This phase was found to be thermodynamically stable at low temperatures and decomposed to Mo_2C and graphite at 1400 K. Using equilibrium and thermodynamic data, the thermodynamic quantities of this phase were calculated as $S°_{298}/R = 4.41 +/- 0.3$ and $\Delta H_{298}°/R = -3430 +/- 800$ K. Part II. Oxide equilibration and solid-state galvanic cell experiments were used to study thermodynamic properties of binary Lewis acid-base stabilized transition metal alloys. The activity of vanadium was determined in alloys of vanadium with platinum group metals such as Rh, Pd and Ir at 1000°C. The activities of titanium in titanium-iridium alloys and of niobium in Nb_3Ir were determined at 1400°C. The ternary phase diagram of V-Pd-O at 1000°C was obtained. Based on the vanadium-palladium results, a partial titration curve of palladium by vanadium was constructed. The excess partial molar Gibbs free energy of vanadium at infinite dilution was found to be -36.4 kcal mol^{-1} at 1000°C. The results of this study are in agreement with the predictions of Brewer's theory of transition metal alloy acid-base behavior.

36887 (LBL—25347) Structural properties of $YBa_2Cu_3O/sub\ 6+\delta/$. Morris, J.W. Jr.; Khachaturyan, A.G. (Lawrence Berkeley Lab., CA (USA)). May 1988. Contract AC03-76SF00098. 9p. (CONF-880529—). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012028/JAW.

From MRS international meeting on advanced materials; Tokyo, Japan (30 May 1988).

The composition-wave theory of oxide structures is used to interpret the equilibrium structures of $YBa_2Cu_3O/sub\ 6+\delta/$, predict its equilibrium phase diagram, describe the transient ordered states that are most likely to appear during decomposition, and discuss the probable transformation paths and microstructures that follow from them. The results are in reasonable agreement with experiment.

36888 (ORNL/Sub—84-00216/1) Studies of dynamic contact of ceramics and alloys for advanced heat engines: Final report. Dufrane, K.F.; Glaeser, W.A.; Rosenfield, A.R. (Battelle Columbus Div., OH (USA)). Mar 1988. Contract AC05-84OR21400. 95p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88008996/JAW.

In support of the efforts to apply ceramics in advanced heat engines, a study was made of the sliding performance of ceramics at the ring/cylinder interface of low heat rejection engines. The objective was to understand the basic mechanisms controlling the wear of candidate ceramics and thereby identify means for applying these ceramics effectively. Attempts to operate three different zirconias, silicon carbide, silicon nitride, and several plasma-sprayed ceramic coatings without lubrication were unsuccessful because of high friction and high wear rates. Experiments using a polyalphaolefin lubricant at temperatures to 260 C identified several combinations having wear rates in the general range likely to be acceptable for engines. Plasma-sprayed coatings of chromium oxide and hypersonic powder flame sprayed coatings of cobalt-bonded tungsten carbide performed particularly well as ring coatings. Similar performance was obtained with these ring coatings operating against silicon carbide, silicon nitride, silicon carbide whisker-reinforced alumina, and chromium oxide coatings. Zirconia experienced high wear rates because of thermal-shock-induced surface cracking. Low thermal conductivity of zirconia allows local areas to heat excessively from friction. Periodic heating induces thermal shock cracking and subsequent spalling. The study demonstrated the importance of lubrication to successful sliding of ceramics and the need for lubricants capable of operating at temperatures in the range of 250 to 650 C. 42 refs., 32 figs., 8 tabs.

36889 (ORNL/TM—10710) Development of x-ray methods for analyzing rough-wear surfaces on ceramics. Blau, P.J.; Houska, C.R. (Oak Ridge National Lab., TN (USA); Virginia Polytechnic Inst. and State Univ., Blacksburg (USA)). May 1988. Contract AC05-84OR21400. 16p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010754/JAW.

This report summarizes research performed by Virginia Polytechnic Institute and State University under subcontract to Oak Ridge National Laboratory. The work, funded by the Energy Conversion and Utilization Technologies Program of the US Department of Energy, began January 1, 1983, and ended September 30, 1987. The research has resulted in the successful completion of Bing Hwang's Ph.D. degree in Materials Engineering Science from Virginia Polytechnic Institute and State University. The reference to Dr. Hwang's thesis is Near Surface Wear Structure of Ceramic Components, Virginia Polytechnic Institute and State University, Blacksburg, Va., May 1987. The purpose of the research was to develop novel x-ray diffraction and fluorescence methods for probing the near-surface (<1 μm deep) zone of worn ceramics. An important aspect of the work in regard to fundamental tribology research was to overcome the difficulties associated with x-ray analysis of rough surfaces. Fully and partially stabilized zirconia (PSZ) were selected as the materials to be examined by the x-ray techniques being developed. The specific characteristics of the worn ceramic surface of most interest were phase content, particle size, and near-surface strains. This summary outlines the major findings of this work. Details of the mathematical analysis may be found in the four cited open-literature references. Material in this report has been abstracted from the original manuscripts and reprints of these references. Each reference is separately outlined. 1 ref., 4 figs.

36890 (PB—88-183926/XAB) Research and development of superconductors. Okugawa, M.; Hiraoka, M.; Takada, Y. (Mitsubishi Cable Industries Ltd., Tokyo (Japan)). 1987. 7p. NTIS, PC E05.

Text in Japanese; Included in Mitsubishi Cable Industries, Ltd., No. 74, 1-7(Oct 1987).

This report introduces the research and development of high-temperature superconducting oxides, which have been drawing world-wide attention since last year. The authors review the characteristics and the mechanism of suprconductivity and the present trend of world-wide R&D of high-temperature superconducting oxides. Through the research into practical applications of high-temperature superconducting oxides, superconductivity has been obtained on silver sheathed wire as well. However, it is still necessary to improve critical current density and stability. In addition to these, thin-film processing technologies are investigated.

36891 (PB—88-197165/XAB) Development of protective coatings for ceramic tubular components. Topical report, March 1986-December 1987. van Roode, M.; Price, J.R. (Solar Turbines, Inc., San Diego, CA (USA)). Dec 1987. 101p. (SR—87-R-5334-12). NTIS, PC A06/MF A01.

Process technology was developed for the deposition of adherent ceramic oxide coatings on silicon-based substrates for corrosion protection of ceramic heat-exchanger tubes operating in aluminum remelters. Single- and multi-layer coatings of mullite, zircon, alumina, yttria, and yttria-stabilized zirconia remained adherent and intact after isothermal heat treatment at 1093°C/120 hours followed by cyclic heat treatment between 1010°C and 371°C (60 one hour cycles). Ten optimized coating compositions were deposited on alpha-SiC and SCRB-210 tubes for environmental-exposure testing in a simulated aluminum-remelt environment. An aluminum-reclamation simulator was designed, constructed, and installed under the program. A computer simulation study was undertaken to characterize the gas-phase chemistry in the aluminum remelt environment and to predict the nature of the corrosion products at the silicon-based tube surfaces. Mechanical properties of coated and uncoated tube specimens were determined.

36892 (PNL-SA—15409) Chemical control of stress in sol-gel derived titania films and their pressure dependent optical properties. Frydrych, W.S.; Exarhos, G.J.; Ferris, K.F.; Hess, N.J. (Pacific Northwest Lab., Richland, WA (USA); Washington Univ., Seattle (USA)). Apr 1988. Contract AC06-76RL01830. 7p. (CONF-880408—20; CONF-880408—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009472/JAW.

From Spring meeting of the Materials Research Society; Reno, NV, USA (4 Apr 1988).

Optical properties and durability of thin films are influenced by strain which can be evaluated from frequency shifts of the lattice phonon lines in measured Raman spectra. The response of titania samples to applied pressure is reported in this work. Anatase and rutile samples of thin films (sol-gel and sputter deposited) and bulk materials have been subjected to hydrostatic pressures approaching 100 kbar in a diamond anvil cell. Results indicate that the rutile samples exhibit similar responses to applied pressure. Anatase sol-gel films exhibit a pressure-dependent response that suggests that the sol-gel film is more compressible than the bulk material, and a pressure-induced phase transformation observed for the bulk material is inhibited in the anatase sol-gel film. The anomalous pressure response of the anatase sol-gel film may result from the film microstructure which has been shown by transmission electron microscopy to consist of spheres of crystalline TiO_2 surrounded by microscopic voids. 9 refs., 4 figs.

36893 (SAND—87-2724C) An XPS [x-ray photoelectron spectroscopy] study of YBa_2Cu_3O/sub x/ surface corrosion. Brow, R.K. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 19p. (CONF-8805123—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010226/JAW.

From Superconductor symposium; Cincinnati, OH, USA (1 May 1988).

X-ray photoelectron spectroscopy (XPS) was used to characterize changes in the surface composition of dense, polycrystalline samples of hot-pressed and sintered tetragonal and orthorhombic YBa_2Cu_3O/sub x/ exposed to ambient conditions. A detectable surface corrosion film forms in less than one second after vacuum fractured surfaces are exposed to room temperature air. Features in the Ba3d, O1s and C1s spectra indicate that this surface film contains $BaCO_3$. Electron micrographs of the vacuum fractured hot-pressed samples reveal primarily a transgranular fracture path, while the fracture surfaces of sintered samples consisted of primarily exposed, faceted grains. The XPS analyses of these later vacuum fractured samples showed high degrees of $BaCO_3$-contamination, similar to what was found on air-exposed surfaces, indicating that significant grain-boundary contamination was present in these materials. 6 figs., 14 refs.

36894 (SAND—88-1197C) La_2CuO/sub 4+δ/: A superconducting superoxide. Schirber, J.E.; Morosin, B.; Venturini, E.L.; Shinn, N.D.; Rogers, J.W. Jr.; Ginley, D.S. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 4p. (CONF-880579—6). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88010325/JAW.

From 10. annual ideas in science and electronics exposition; Albuquerque, NM, USA (10 May 1988).

High pressurehigh temperature oxygen treatment results in changing antiferromagnetic La_2CuO_4 into a bulk superconductor La_2CuO/sub 4.13/. Evidence demonstrating that the excess oxygen is incorporated as the superoxide, is diacharged. 7 refs.

36895 (SAND—88-1467C) Penetration and perforation of reinforced-concrete targets. Forrestal, M.J.; Hightower, M.M.; Luk, V.K.; Christensen, B.K. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 23p. (CONF-8805137—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011483/JAW.

From NATO workshop on penetration; NDRE, Norway (30 May 1988).

The authors developed penetration equations for rigid, ogival nose projectiles that penetrated and perforated reinforced-concrete targets at normal incidence. The closed-form, penetration

equations depend on the impact velocity, geometry and mass of the projectile, and the material properties of the target. Predictions from the models showed good agreement with test data.

36896 **Mechanical and superconducting properties of sintered composite $YBa_2Cu_3O_7$/sub -//sub δ/ tape on a silver substrate.** Singh, J.P.; Shi, D.; Capone D.W. II. (Materials and Components Technology Division, Argonne National Laboratory, Argonne, Illinois 60439). *Applied Physics Letters;* 53: No. 3, 237-239(18 Jul 1988).

Flexible sintered composite YBa_2Cu_3O/sub 7-//sub δ/ tapes on a silver substrate have been fabricated by the tape casting technique followed by appropriate sintering. The sintered composite tape can be bent into an arc of a 27-mm-diam circle without breaking. This represents approximately 2% strain, as compared with a typical YBa_2Cu_3O/sub 7-//sub δ/ superconductor material without silver, which fractures at a strain of ~0.1—0.2%. The silver addition does not adversely affect the superconducting properties of the composite.

36897 **Switching mechanism in V_2O_5 gel films.** Zhang, J.G.; Eklund, P.C. (Department of Physics and Astronomy, University of Kentucky, Lexington, Kentucky, 40506). *Journal of Applied Physics;* 64: No. 2, 729-733(15 Jul 1988).

We report the first explanation of the novel electrical switching in two-terminal devices based on thin $V_2O_5x1.6H_2O$ gel films. The switching is shown to be associated with the existence of a current-induced channel between the contacts. The data demonstrate that the switching between the "on" and "off" states of the device is driven by the joule heating of a metal-insulator (MI) transition in the channel material (or filaments in the channel). Resistivity data on the channel exhibit a sharp MI transition at T = 334 K which is also the temperature at which the device is observed to stop switching. The signature of the MI transition in the channel is very similar to that observed in VO_2(T/sub MI/ = 341 K), suggesting the channel may contain VO_2√/sub x/ conduction paths.

36898 **Electron channeling study of polycrystalline YBa_2Cu_3O/sub x/.** Verhoeven, J.D.; Gibson, E.D.; Chumbley, L.S.; McCallum, R.W.; Baker, H.H. (Ames Laboratory and Department of Material Science and Engineering, Iowa State University, Ames, Iowa 50011). *Journal of Applied Physics;* 64: No. 2, 761-765(15 Jul 1988).

An electron channeling study has been done on large grained YBa_2Cu_3O/sub x/ samples. Selected area channeling patterns (SACP) were used to examine several dozen grains on electropolished surfaces and it was demonstrated that (a) the twin planes observed in polarized optical light microscopy lie parallel to {110} crystal planes, and (b) the long flat sides of high aspect ratio grains are formed by basal planes, and the shorter sides are formed by either (010), (100), or {110} planes. A majority of the large grains examined were found to contain subgrains, misaligned by 0.5°—1° and ranging in size from less than 3 to 20 μm. The origin of the subgrains is not understood.

36899 **Highly oriented superconducting thin films derived from the sol-gel process.** Kramer, S.A.; Kordas, G.; McMillan, J.; Hilton, G.C.; Van Harligen, D.J. (Department of Materials Science and Engineering and Materials Research Laboratory, University of Illinois at Urbana—Champaign, 105 South Goodwin, Urbana, Illinois 61801). *Applied Physics Letters;* 53: No. 2, 156-158(11 Jul 1988).

Highly oriented YBa_2Cu_3O/sub 6+//sub x/ superconducting thin films have been developed via sol-gel processing. Film deposition involved spin coating a "partially hydrolyzed" metal-alkoxide stock solution onto single-crystal [100] $SrTiO_3$ substrates. Although scanning electron microscopy revealed the film consisted of oriented polycrystallites, from the broad statistical x-ray diffraction data the 1000 A film "appeared" to be single crystal with moderate mosaic spread (i.e., full width at half-maximum was 0.3° in θ at a 2θ of 55°). No twinning of the crystal was found in any of the three orthogonal directions (2θ, phi, chi). The onset temperature T/sub c/ for the film was 55 K while the critical current density J/sub c/ was found to be 10^3 A/cm^2.

36900 **60—90 K superconducting phase transition in YBa_2Cu_3O/sub 7-//sub δ/.** Shi, D.; Capone D.W. II. (Materials Science Division, Argonne National Laboratory, Argonne, Illinois 60439). *Applied Physics Letters;* 53: No. 2, 159-161(11 Jul 1988).

The kinetic process between the 60 and 90 K superconducting phase transition has been explored to study the oxygen ordering mechanisms. An abrupt change in T/sub c/ from 60 to 90 K is observed as the sample's oxygen content is rapidly varied from around 6.6 to 6.9. No intermediate T/sub c/ values are obtained, which suggests an oxygen ordering instability, leading to a phase transition between the 60 and 90 K superconducting phases.

36901 **Growth kinetics of ZnO prepared by organometallic chemical vapor deposition.** Souletie, P.; Wessels, B.W. (Department of Materials Science and Engineering and Materials Research Center, Northwestern University, Evanston, Illinois 60208). *Journal of Materials Research;* 3: No. 4, 740-744(Jul 1988).

Zinc oxide films were deposited using the reactants dimethyl zinc and tetrahydrofuran. Growth kinetics were determined from the dependence of the growth rate on substrate temperature and reactant partial pressure. A complex temperature dependence was observed over the temperature range of 300—500 °C. For a deposition temperature of 400 °C, the growth kinetics were modeled using a bimolecular surface reaction rate-limited mechanism. The layers were characterized using x-ray diffractometer and Auger spectroscopy measurements.

36902 **Zirconium oxide crystal phase: The role of the pH and time to attain the final pH for precipitation of the hydrous oxide.** Srinivasan, R.; Harris, M.B.; Simpson, S.F.; De Angelis, R.J.; Davis, B.H. (Kentucky Energy Cabinet Laboratory, University of Louisville, P.O. Box 13015, Lexington, Kentucky 40512 and the Department of Metallurgical Engineering and Materials Science, University of Kentucky, Lexington, Kentucky 40506). *Journal of Materials Research;* 3: No. 4, 787-797(Jul 1988).

Precipitated hydrous zirconium oxide can be calcined to produce either a monoclinic or tetragonal product. It has been observed that the time taken to attain the final pH of the solution in contact with the precipitate plays a dominant role in determining the crystal structure of the zirconium oxide after calcination at 500 °C. The dependence of crystal structure on the rate of precipitation is observed only in the pH range 7—11. Rapid precipitation in this pH range yields predominately monoclinic zirconia, whereas slow (8 h) precipitation produces the tetragonal phase. At pH of approximately 13.0, only the tetragonal phase is formed from both slowly and rapidly precipitated hydrous oxide. The present results, together with earlier results, show that both the pH of the supernatant liquid and the time taken to attain this pH play dominant roles in determining the crystal structure of zirconia that is formed after calcination of the hydrous oxide. The factors that determine the crystal phase are therefore imparted in a mechanism of precipitation that depends upon the pH, and it is inferred that it is the hydroxyl concentration that is the dominant factor.

36903 **Nature of the magnetic order of Cu in oxygen-deficient $NdBa_2Cu_3O_6$μ/sub x/.** Lynn, J.W.; Li, W.; Mook, H.A.; Sales, B.C.; Fisk, Z. (Center for Superconductivity Research, Department of Physics, University of Maryland, College Park, Maryland 20742). *Physical Review Letters;* 60: No. 26, 2781-2784(27 Jun 1988).

Neutron diffraction measurements have been taken on single crystals of $NdBa_2Cu_3O_6$μ/sub x/ to explore the nature of the magnetic order as a function of oxygen concentration x. The Cu-O planes are known to order antiferromagnetically at T/sub N1/, with T/sub N1/(x≅0)≅450 K. At lower temperatures we find that the oxygen-deficient Cu planes also order magnetically [T/sub N2/(x≅0.1)≅80 K], with a large ordered moment of 0.46μ/sub B/ and a simple antiferromagnetic sequencing along the c axis. Both ordering temperatures decrease with increasing x, with T/sub N2/ being much more sensitive to x than T/sub N1/.

36904 Single-crystal neutron-diffraction study of $La_2Cu_{0.95}Li_{0.05}O_4$. Delgado, J.M.; McMullan, R.K.; Diaz de Delgado, G.; Wuensch, B.J.; Picone, P.J.; Jenssen, H.P.; Gabbe, D.R. (Department of Materials Science and Engineering, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physical Review [Section] B: Condensed Matter;* **37**: No. 16, 9343-9352(1 Jun 1988).

La_2CuO_4 possesses an orthorhombic superstructure based upon a tetragonal K_2NiF_4-type subcell for which a number of different space groups have been reported. A single-crystal neutron diffraction study, performed with large flux-grown crystals, confirms the nature of the substructure and provides a = 5.359(1), b = 5.363(1), and c = 13.127(2) A. The orthorhombic strain, $\epsilon = (b-a)(12(a+b))$, is 7.64 x 10^{-4}, an order of magnitude smaller than for pure La_2CuO_4 as a result of incorporation of Li, derived from the flux, in the Cu site. The apparent space group is Pccn, but systematic examination of structural models in all possible centrosymmetric orthorhombic subgroups which may accomodate a K_2NiF_4-type substructure led to satisfactory refinement with positive-definite temperature factors only in space group Bmab-D_{2h}^{18}. A substantial number of very weak reflections were detected which violate the required systematic absences of this space group. Through structure-factor calculation, after reindexing based on a probable twin law, and through dark-field transmission electron microscopy, the "forbidden" reflections are shown to arise from a 0.302(2) volume fraction of domains in twinned orientation which otherwise escaped detection because of the small value of ϵ. Final agreement indices for 346 reflections with $I \geq \sigma(I)$ are R(F) = 3.22%, $R(F^2)$ = 2.57%, R/sub w/(F_s) = 3.07%; the goodness of fit, S, is 1.13.

36905 Magnetic properties of oxygen-reduced, rare-earth based $R_1Ba_2Cu_3O_7\sqrt{}$/sub x/ compounds with R = Gd, Dy, and Ho. Thompson, J.R.; Sales, B.C.; Kim, Y.C.; Sekula, S.T.; Boatner, L.A.; Brynestad, J.; Christen, D.K. (Solid State Division, Oak Ridge National Laboratory, P.O. Box 2008, Oak Ridge, Tennessee 37831-6061). *Physical Review [Section] B: Condensed Matter;* **37**: No. 16, 9395-9400(1 Jun 1988).

The bulk magnetic properties of tetragonal, oxygen-depleted, polycrystalline samples of sintered $R_1Ba_2Cu_3O_7\sqrt{}$/sub x/ compounds with x = 0.95 have been investigated. Materials containing the rare-earth (RE) ions Gd, Dy, and Ho were studied. In each case, the magnetic susceptibility chi was described by a Curie-Weiss (CW) dependence with effective moments that were very nearly equal to the free-ion values—behavior that is very similar to the superconducting counterparts of these materials where the oxygen has not been depleted. The field dependence of the magnetization M(H,T) was found to be substantially modified by crystalline electric field effects and by the influence of Re-Re interactions.

36906 Muon depolarization and magnetic-field penetration depth in superconducting $GdBa_2Cu_3O$/sub x/. Cooke, D.W.; Hutson, R.L.; Kwok, R.S.; Maez, M.; Rempp, H.; Schillaci, M.E.; Smith, J.L.; Willis, J.O.; Lichti, R.L.; Chan, K.B.; and others. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review [Section] B: Condensed Matter;* **37**: No. 16, 9401-9404(1 Jun 1988).

Positive muon spin-rotation (μSR) measurements on $GdBa_2Cu_3O$/sub x/(x≅7) have been conducted in the temperature interval 5.8—300 K. A temperature-dependent relaxation, attributable to Korringa relaxation of the Gd ion, as well as vortex-state relaxation are observed. Magnetic field penetration depths of approximately 1550 and 1900 A (two samples) are extracted from the data. Two muon stopping sites exist for T≦80 K, one being associated with normal regions of the sample and the other with superconducting regions.

36907 Helium, tritium, and protium NMR studies of tritide-free aged PdT/sub x/. Bowman R.C. Jr.; Bambakidis, G.; Abell, G.C.; Attalla, A.; Craft, B.D. (Monsanto Research Corporation, Mound Facility, Miamisburg, Ohio 45342). *Physical Review [Section] B: Condensed Matter;* **37**: No. 16, 9447-9454(1 Jun 1988).

Pulsed NMR relaxation-time measurements have been performed on PdT/sub x/, aged approximately eight years, after first removing most of the tritium by room-temperature desorption and again after addition of protium to one of these tritide-free samples. Spin-lattice and spin-spin relaxation times T_1 and T_2 were measured for both tritium and ^{3}He in the temperature range 100—300 K, while T_1, T_2, and the rotating-frame relaxation time T_1/sub rho/ were obtained for protium in the same temperature range. The relative magnitudes of T_1, the decay time T_2/sub m/ of the Carr-Purcell-Meiboom-Gill signals, and the line-shape decay time T_2/sup */ for ^{3}He in tritide-free PdT/sub x/, are consistent with the distribution of the helium as microbubbles in the Pd matrix. The increase in the ^{3}He values of T_1 upon addition of protium to an atomic ratio [H][Pd] = 0.68 is attributed partially to a decrease in the Fermi-level density of states and partially to other internal relaxation mechanisms. Analysis of the dipolar component T_1/sub d/ of T_1, for protons in the sample to which protium was added, gives a value of the diffusion activation energy at temperatures between 230 and 300 K which is in agreement with that for β-PdH/sub x/. Comparison with the triton NMR in tritide-free PdT/sub x/ indicates that the residual tritium, rather than forming a dilute solid solution, occupies unusual sites in the Pd lattice, perhaps at internal surfaces surrounding the ^{3}He microbubbles.

36908 Anisotropic thermoelectric power and conductivity in single-crystal YBa_2CuO/sub y/. Crommie, M.F.; Zettl, A.; Barbee T.W. III; Cohen, M.L. (Department of Physics, University of California, and Materials and Chemical Sciences Division, Lawrence Berkeley Laboratory, Berkeley, California 94720). *Physical Review [Section] B: Condensed Matter;* **37**: No. 16, 9734-9737(1 Jun 1988).

Thermoelectric power (TEP) and electrical conductivity measurements are reported for different crystal directions and for varying oxygen deficiency in single-crystal YBa_2Cu_3O/sub y/. The dependency of the transport parameters on direction are compared with the predictions of band theory. The c-axis conductivity and TEP are suggestive of non-band-transport as might be displayed by a localized system.

36909 Two-dimensional zone-center spin-wave excitations in La_2CuO_4. Peters, C.J.; Birgeneau, R.J.; Kastner, M.A.; Yoshizawa, H.; Endoh, Y.; Tranquada, J.; Shirane, G.; Hidaka, Y.; Oda, M.; Suzuki, M.; and others. (Department of Physics, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physical Review [Section] B: Condensed Matter;* **37**: No. 16, 9761-9764(1 Jun 1988).

We have studied the spin-wave excitations near the two-dimensional zone center at 80 K in a single crystal of La_2CuO_4 which orders at T/sub N/ = 195 K. In-plane and out-of-plane modes are observed at energies of 1.0 +- 0.25 meV and 2.5 +- 0.5 meV, respectively. The in-plane mode energy is determined primarily by the antisymmetric exchange and it measures this term directly. The out-of-plane mode energy corresponds to a planar anisotropy energy of ~0.016 meV. We observe, in addition, the appearance of significant E≅0 scattering below 30 K.

36910 Symmetry breaking and nonlinear electrodynamics in the ceramic superconductor $YBa_2Cu_3O_7$. Jeffries, C.; Lam, Q.H.; Kim, Y.; Bourne, L.C.; Zettl, A. (Physics Department, University of California, Berkeley, California 94720). *Physical Review [Section] B: Condensed Matter;* **37**: No. 16, 9840-9843(1 Jun 1988).

For bulk samples of the ceramic superconductor $YBa_2Cu_3O_7$ in a radio-frequency magnetic field and in a dc magnetic field H_0, we observe novel nonlinear behavior including very-high-order odd-harmonic generation if $H_0 = 0$. If H_0not =0, there is additional even-harmonic generation. The even-harmonic power displays a very sharp dip at $H_0 \sim 0$, of width ~100 μG. This and related behavior can be semiquantitatively understood by modeling the system as a suitably averaged collection of flux-quantized supercurrent loops containing Josephson junctions.

36911 Long-range antiferromagnetic order of the Cu in oxygen-deficient RBa$_2$Cu$_3$O$_6$μ/sub x/. Li, W.; Lynn, J.W.; Mook, H.A.; Sales, B.C.; Fisk, Z. (Department of Physics, University of Maryland, College Park, Maryland 20742). *Physical Review [Section] B: Condensed Matter;* **37**: No. 16, 9844-9847(1 Jun 1988).

We have employed polarized and unpolarized neutron-diffraction techniques on both powders and single crystals to establish the nature of the magnetic order of the Cu ions in oxygen deficient (non-superconducting) RBa$_2$Cu$_3$O$_6$μ/sub x/ (R = Y, Nd). Magnetic Bragg peaks of the type (h2,k2,l) are observed, which yield a magnetic structure in which the Cu spins are coupled antiferromagnetically both in the Cu-O planes as well as along the tetragonal c axis, with the spin direction in the tetragonal plane. The Neel temperature is very sensitive to the oxygen content, with T/sub N//sub (// sub x//sub ~//sub 0)/≅500 K, while the spin configuraton is independent of x.

36912 Magnetic field dependence of nonresonant microwave power dissipation in YBa$_2$Cu$_3$O$_7$√/sub x/. Tomasch, W.J.; Blackstead, H.A.; Ruggiero, S.T.; McGinn, P.J.; Clem, J.R.; Shen, K.; Weber, J.W.; Boyne, D. (Physics Department, University of Notre Dame, Notre Dame, Indiana 46556). *Physical Review [Section] B: Condensed Matter;* **37**: No. 16, 9864-9867(1 Jun 1988).

We report measurements of the H-dependent component of dissipated power δP/sub A/(H,T) for H = 0—19 kOe and T = 60—95 K. Powdered bulk material is exposed to the maximum H/sub ac/ (minimum E/sub ac/) field produced by a 20.9-GHz cavity. In the normal state, ac losses depend weakly on H and thus δP/sub A/ is small. δP/sub A/ increases abruptly at T/sub c/ and varies roughly as √H , consistent with unpinned vortex motion. At lower T, δP/sub A/ decreases and becomes approximately linear in H, consistent with pinning-force effects. We observe abrupt structure near H/sub c/$_1$ and an absence of hysteresis. Our method deemphasizes low-J/sub c/ material at grain boundaries. The distinctive variation of δP/sub A/(H,T) provides a signature suitable for identifying minority superconductive phases in electrically discontinuous samples.

36913 Neutron diffraction study of hydrogen positions at 13 K, domain model, and chemical composition of staurolite. Stahl, K.; Kvick, A.; Smith, J.V. (Univ. of Lund (Sweden)). *Journal of Solid State Chemistry;* **73**: No. 2, 362-380(Apr 1988). Contract AC02-76CH00016.

Comparison of new neutron and old X-ray diffraction data for single crystals of staurolite from Pizzo Forno yielded unique answers to some, but not all, outstanding structural questions. Neutron data were collected at 13(1) K for a crystal with assumed composition Li/sub 0.07/Mg/sub 0.87/Ti/sub 0.14/Cr/sub 0.01/Mn/sub 0.04/Fe/sub 3.00/$^{2+}$ Fe/sub 0.06/$^{3+}$ Co/sub 0.01/Zn/sub 0.05/Al$_{17}$.69Si/sub 7.67/O$_{48}$H/sub 3.41.F//sub 0.01/, M/sub w/ = 1671, a = 7.8639(10), b = 16.625(2), c = 5.651(2) A, β = 90.015(14)°, C2m, Z = 1, D/sub x/ = 3.75 g cm^{-3}, 1874 (1024 unique) reflections, λ = 1.1598(1) A, R(F) = 3.3%. A structural model with three types of domains is proposed: ~ 63% type 1, (Fe, etc.) + H(1); ~ 22% type 2, (Mg, etc.) + H(2); ~ 15% type 3, (Fe, etc.) without hydrogen. For the orthorhombic pseudostructure, the occupancies of the two hydrogen sites place strong restrictions on the other site occupancies. A plausible structural; formula is: [Si 7.67, Al 0.33]$_8$[Fe^{2+} 3.00, Li 0.07, Mn 0.04, Zn 0.02, Co. 0.01]/sub 3.14/[Al(1) site: Al(1) site: Al 7.94, Fe^{3+} 0.06]$_8$[Al(2) site: al 7.52, Mg 0.35, Ti 0.11, V 0.01, Cr 0.01]^8[Al(3) site: al 1.88, Mg 0.09, Ti0.03]$_2$[U site: Mg 0.41, Zn 0.02]/sub 0.43[H(2)]//sub 0.86/. For the monoclinic structure, the A and B subcomponents are less different for the crystal used for neutron diffraction than for the smaller one used for X-ray diffraction.

36914 Synthesis and structural characterization of CaTiO$_3$ doped with 0.05-7.5 mole% gadolinium(III). Larson, E.M.; Eller, P.G.; Purson, J.D.; Pace, C.F.; Eastman, M.P.; Greegor, R.B.; Lytle, F.W. (Los Alamos National Lab., NM (USA)). *Journal of Solid State Chemistry;* **73**: No. 2, 480-487(Apr 1988). Contract FG06-84ER45121.

Titanates containing 0.05-7.5 mole% gadolinium(III) in the CaTiO$_3$ perovskite lattice have been prepared and characterized by X-ray diffraction and absorption, electron paramagnetic resonance, and Raman methods. The structural studies confirm the predicted site substitution of Gd^{3+} ions into the Ca^{2+} sites and suggest charge compensation by a cation deficiency mechanism (Ca^{2+} andor Ti^{4+} vacancies). Evidence is presented for a significant difference between local Gd^{3+} -substituted sites and the average Ca(Gd) sites, resulting from the difference in charge and size of the two ions. A least-squares refinement of single-crystal X-ray data was carried out on (Ca/sub 0.925/Gd/sub 0.0975/)TiO$_3$, with resulting cell parameters and major structural features within three standard deviations of those previously found for stoichiometric CaTiO$_3$: space group Pbnm, a = 5.381(1), b = 5.449(1), c = 7.647(1) A, Z = 4, R = 4.1% for 236 reflections with I ≧ 2σ(I).

36915 Structural studies of Li/sub 0.7/VO$_2$ in the temperature range 20-300°C. Cardoso, L.P.; Cox, D.E.; Hewston, T.A.; Chamberland, B.L. (Brookhaven National Lab., Upton, NY (USA)). *Journal of Solid State Chemistry;* **72**: No. 2, 234-243(Feb 1988). Contract AC02-76CH00016.

The ordered rock-salt type compound Li/sub 0.7/VO$_2$ has recently been found to exhibit some unusually large hysteresis effects in its magnetic and thermal properties between 150 and 280°C, related to the magnetic transition known to occur at about 190°C in LiVO$_2$. X-ray and neutron powder diffraction measurements have been made on samples of Li/sub 0.7/VO$_2$ in an effort to classify structural changes believed to accompany this transition but not hitherto reported in any detail. The unit cell parameters were found to change from a = 2.837, c = 14.775 A at 24°C to a = 2.913, c = 14.640 A at 263°C, with a large discontinuity in the transition region. Rietveld refinement was carried out on X-ray data collected at these temperatures and on neutron data collected at 35°C, the main change being an increase in the V-O and V-V distances from 1.98 and 2.84 A at 24°C to 2.02 and 2.91 A at 263°C, respectively. The only indication of any departure from R3m symmetry in the low-temperature phase was the presence of two extremely weak superlattice peaks in the 24°C X-ray data which can be indexed in terms of an enlarged cell with a' = a √3,c' = c. Above 250°C, the gradual development of a second phase was noted, identified as the cubic spinel LiV$_2$O$_4$ resulting from the disproportionation of Li/sub 0.7/VO$_2$ into LiVO$_2$ and the spinel. Hysteresis effects were observed in the X-ray data which closely parallel those previously reported for the magnetic and thermal properties and which can be attributed to the disproportionation reaction.

36916 Preparation and crystal structures of plutonium(IV) hexachloro complexes, Rb$_2$PuCl$_6$ and K$_2$PuCl$_6$. Morss, L.R.; Fujino, T. (Argonne National Lab., IL (USA)). *Journal of Solid State Chemistry;* **72**: No. 2, 338-352(Feb 1988). Contract W-31-109-ENG-38.

Rb$_2$PuCl$_6$ and K$_2$PuCl$_6$ were prepared by heating mixtures of anhydrous PuCl$_3$ and the respective alkali metal chlorides under high Cl$_2$ pressures. Their crystal structures were determined by powder X-ray crystallography. Rb$_2$PuCl$_6$: hexagonal, space group P6$_3$mc, a = 7.377 +- 0.002, c = 11.880 +- 0.007 A, Z = 2, V = 279.9 +- 0.3 A^3 (per formula), D/sub x/ = 3.69 gcm^3. K$_2$PuCl$_6$: monoclinic, space group P2m, a = 7.218 +- 0.005, b = 7.611 +- 0.006, c = 10.208 +- 0.007 A, β = 91.59 +- 0.04°, Z = 2, V = 280.3 +- 0.3 A^3 (per formula), D/sub x/ = 3.14 gcm^3. The variable atom parameters were obtained by means of electrostatic calculation to have the maximum Madelung constant. Raman spectra showed two lines corresponding to ν$_1$(A/sub 1g/) and ν$_5$(F/sub 2g) for both compounds. The difference of stability in M$_2$PuCl$_6$ (M = K, Rb, Cs) is discussed.

36917 Preparation and crystal structures of plutonium(III) pentachloro complexes, K$_2$PuCl$_5$ and Rb$_2$PuCl$_5$. Morss, L.R.; Fujino, T. (Argonne National Lab., IL (USA)). *Journal of Solid State Chemistry;* **72**: No. 2, 353-362(Feb 1988). Contract W-31-109-ENG-38.

K$_2$PuCl$_5$ and Rb$_2$PuCl$_5$ were prepared by heating mixtures of anhydrous PuCl$_3$ and respective alkali metal chlorides in vacuum-sealed quartz ampoules at 400-500°C. Their crystal structures are both orthorhombic with K$_2$PrCl$_5$-type structure (space group Pnma, Z = 4), determined by powder X-ray crystallogra-

phy. K_2PuCl_5: lattice parameters a = 12,674 +/- 0.003, b = 8.727 +/- 0.002, c = 7.969 +/- 0.002 A; cell volume 220.4 +/- 0.2 A^3; X-ray density 3.726 +/- 0.004 g/cm^3. Rb_2PuCl_5: lattice parameters a = 13.093 +/- 0.008, b = 8.909 +/- 0.005, c = 8.178 +/- 0.005 A; cell volume 238.5 +/- 0.4 A^3; X-ray density 4.088 +/- 0.008 g/cm^3. Fourteen variable atom parameters of these complexes were obtained by electrostatic calculation with a program which maximizes the Madelung constant under the condition that the ion-ion separations in the crystal are all larger than respective critical distances. The measured Raman lines of Rb_2PuCl_5 are very close to those of hexachloride complexes. The bond lengths and stability of M_2PuCl_5 (M = K, Rb) are discussed.

36918 (AD-A—190034/9/XAB) Molecular dynamics of materials possessing high energy content. Final report, 1 November 1985-31 October 1987. Turro, N.J. (Columbia Univ., New York (USA)). 26 Jan 1988. 17p. NTIS, PC A03/MF A01.

The accomplished research has centered about the construction of new instrumentation for the investigation of transient high-energy materials and the exploration of how the chemistry of transient high-energy materials and the dynamics of these species respond to systematic variations in structure, environments, and experimental variables. Particular emphasis was given to reactions in microheterogeneous environments and interfaces provided by micelles, polymers and porous solids, using resonance Raman spectroscopy, nuclear magnetic resonance spectroscopy, electron spin-resonance spectroscopy, optical absorption, and optical emission. The use of external magnetic fields on the reactivity of carbenes, of radical pairs, and of biradicals, and of adsorption of reactive intermediates at interfaces was explored as methods which may be capable of extending the lifetimes of these transient species.

36919 (AD-A—190082/8/XAB) Chalcogenide glasses. Taylor, P.C. (Utah Univ., Salt Lake City (USA). Dept. of Physics). 15 Aug 1987. 4p. (—83-K-0535-14). NTIS, PC A02/MF A01.

Pub. in MRS Bulletin, 36-38(16 Jun-15 Aug 1987).

Although there are some significant exceptions, most important glass-forming systems contain elements from the sixth, or chalcogenide, column of the periodic table (oxygen, sulfur, selenium, or tellurium). The glasses that contain oxygen are typically insulators, while those that contain the heavier chalcogen elements are usually semiconductors. Even though oxygen is technically a chalcogen element, the term chalcogenide glass is commonly used to denote those largely covalent, semiconducting glasses contain sulfur, selenium, or tellurium as one of the constituents.

36920 (AD-A—190087/7/XAB) Optical properties of InP doping superlattices grown by metal/organic chemical vapor deposition. Gal, M.; Viner, J.M.; Taylor, P.C. (Utah Univ., Salt Lake City (USA). Dept. of Physics). Apr 1987. 6p. (—83-K-0535-15). NTIS, PC A02/MF A01.

Pub. in Jnl. of Vacuum Science and Technology B, Vol. 5, No. 2, 504-507(Mar-Apr 1987).

Recently the authors reported the first InP superlattice grown by organometallic vapor-phase epitaxy (organometallic vapor-phase epitaxy or metal/organic chemical vapor deposition) technique. These samples were grown in an atmospheric-pressure reactor using trimethylindium and phosphine in a hydrogen ambient. The n- and p-type dopants were diethyltellurium and dimethylzinc, respectively. Several experiments indicate that the interfaces between n and p regions in these structures are sharp and of high quality. The peak energy and the line shape of the photoluminescence spectra depend on the excitation intensity just as predicted theoretically. In addition, time decay of the luminescence contains distinct steps, indicating the existence of subbands due to quantum size effects. The first photo-reflectance (PR) measurements were also performed on these doping superlattices. These measurements show that the photoexcited carriers modulate the subband levels in a very predictable fashion. The observed PR line shapes are well explained by photomodulation of the subbands in the conduction band.

36921 (AD-A—190374/9/XAB) Low-cost electromagnetic shielding using drywall composites: results of RFI (radio-frequency interference) testing of a shielding effectiveness. Final technical report. Williams, P.F.; Heyen, K.K.; McCormack, R.G. (Army Construction Engineering Research Lab., Champaign, IL (USA)). Oct 1987. 60p. (CERL-TR-M—88/02). NTIS, PC A04/MF A01.

Because of developments in electronics technology, the need for electromagnetic shielding has increased. To reduce the cost of this shielding, new materials are needed. The U.S. Army Corps of Engineers, Fort Worth District (FWD), and the U.S. Army Construction Engineering Research Laboratory (USA-CERL) have developed composite materials that use standard, construction-grade, aluminum foil-backed gypsum board in combination with either a metal mesh or lead foil. Special seams for these composites were designed by U.S. Gypsum Company. USA-CERL evaluated the adequacy of each material and seam design by using radio-frequency antennas and receivers to measure its shielding effectiveness when mounted in the wall of a shielded room. These evaluations showed that the composite panels met the specified requirement of 60 decibels (dB) of shielding. The composites were also shown to be adequate for most communications security applications. However, the addition of a seam decreased shielding by as much as 10 dB.

36922 (BFR-R—104-1986) Thermal transfer characteristics of Swedish soils. Thermal conductivity, specific thermal capacity and latent heat. Sundberg, J. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 125p. (In Swedish). NTIS (US Sales Only), PC A06. Order Number DE88752902/JAW.

The objective of this project has been to determine the thermal transfer characteristics of Swedish soils. Variations of up to a factor of 10 can be encountered, depending on the type of soil, water content, porosity etc. Water content is a very important parameter for thermal conductivity, thermal capacity and latent heat of freezing. Water content at a given site is determined by the water retention characteristics of the soil and by the depth down to the ground-water table. Fine-grained soils, such as clay and silt, have excellent water retention characteristics, while sand and coarser soils have considerably poorer characteristics. Mineral content is of importance primarily for thermal conductivity. A sand with a high quartz content can exhibit a thermal conductivity 40 percent higher than that of clay. The work of the project has therefore also included investigation of the mineral content of various types of soil. A total of over 900 measurements of thermal conductivity in common Swedish soils have been made. Measurements of water content, density, humus content, grain size and water retention characteristics have also been made at the same time. Diagrams have been drawn showing the thermal conductivity and thermal capacity of frozen and unfrozen ground, and of latent heat. Entry parameters in the diagrams are dry density, degree of water saturation and type of soil. With 37 refs.

36923 (BFR-R—107-1986) Curing of structual concrete with infrared radiant heat. Nilsson, J. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 76p. (In Swedish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752904/JAW.

This report shows how the measures necessary for the curing of structural concrete, in order that the intended strength may be achieved within the specified time, can be determined by means of computer calculations. In these calculations, the effect of e.g. different types of formwork or thermal insulation, the time of formwork is struck, application and removal of thermal insulation, and varying degrees of heating, can be studied. On the basis of the above, the combination of measures which meets the specified strength requirements as a given age and which produces the lowest cost for each particular pour, can be selected. This method is an alternative to the selection of measures 'by feel' or 'on the

basis of experience' or by using collections of diagrams. However, the results are only as reliable as the input data selected for the calculations. Examples of factors of uncertainty are assumptions regarding outdoor temperature and wind velocity. With particular reference to radiant heating, the efficiencies of liquefied gas and electric radiant heaters are analyzed, and the absorption capacity of formwork material and concrete are investigated. Development of temperature in concrete floors is simulated for different climatic, insulation and heating conditions. The calculated temperature development and concrete strength are compared with the results of field studies made during winter pours of concrete floors in the course of normal production. Reduction of strength due to heat curing and deflections of concrete floors due to early striking of formwork are discussed and countermeasures are proposed. With 28 refs.

36924 (BNL—41200) Ionic conductive polymers based on crosslinked elastic siloxane-ethylene oxide copolymers. Mei, H.L.; Okamoto, Y.; Skotheim, T.; Harris, C.S. (Polytechnic Univ., Brooklyn, NY (USA). Polymer Research Inst.; Brookhaven National Lab., Upton, NY (USA)). 1987. Contract AC02-76CH00016. 26p. (CONF-8710283—5). NTIS, PC A03;3. Order Number DE88011243/JAW.

From Symposium on electroresponsive polymers; Upton, NY, USA (4 Oct 1987).

Rubber-like elastic materials of poly(phenylsiloxane-ethylene oxide) crosslinked copolymers were synthesized and complexes with CF_3SO_3Li were made. The highest ionic conductivity was observed for the polymersalt complex with the number of EO unit n = 7 and OLi = 12. The room temperature conductivity is considerably higher than that of PEO-alkali metal salt complexes. Both Arrhenius (n= 23 and 34) and VTF (n = 3, 7, 9, and 14) type behavior for the temperature dependence of the conductivity were observed. These systems were found to be thermally stable in dry condition up to at least 225{degree}C. 12 refs., 9 figs., 1 tab.

36925 (CONF-880118—8) Observations on residual stresses in ceramic composites by neutron diffraction techniques. Majumdar, S.; Kupperman, D.S.; Singh, J.P. (Argonne National Lab., IL (USA)). Feb 1988. Contract W-31-109-ENG-38. 32p. (CONF-880118—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009937/JAW.

From 12. annual conference on composites and advanced ceramic materials; Cocoa Beach, FL, USA (20 Jan 1988).

This paper presents a comparison between the residual thermal stresses and strains, developed during cooling of a ceramic-ceramic (SiC–Al_2O_3) composite, determined by analytical methods and by an experimental neutron diffraction technique. Because the coefficient of thermal contraction of the matrix (Al_2O_3) is greater than that of the residual stresses were determined by using two self-consistent models. In the first, a plane strain composite cylinder model, the fibers are approximated as infinitely long circular cylinders. In the second, due to Eshelby, the fibers are approximated as ellipsoids (specialized to prolate spheroids in this case). The two models give almost identical estimates of the stresses and strains in the fibers. The interpretation of the measured strains in the fibers by neutron scattering has some uncertainty because of the lack of a clearly defined crystal structure of SiC. However, in general, the measured and calculated strains are reasonably close. 15 refs., 8 figs.

36926 (CONF-880417—14) Mechanical properties and deformation of polycrystalline lithium orthosilicate. Bar, K.; Chu, C.Y.; Singh, J.P.; Goretta, K.C.; Routbort, J.L.; Billone, M.C.; Poeppel, R.B. (Argonne National Lab., IL (USA)). Feb 1988. Contract W-31109-ENG-38. 10p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009936/JAW.

From International symposium on nuclear fusion technology; Tokyo, Japan (10 Apr 1988).

Room-temperature strength, fracture toughness, Young's modulus, and thermal-shock resistance were determined for 68–98% dense lithium orthosilicate (Li_4SiO_4) specimens. In the low-density regime, both strength and fracture toughness were controlled by the density of the specimen. At high density, the strength depends on grain size. Young's modulus values ranged from 30–103 GPa at densities between 68 and 98% TD. A critical quenching temperature difference in the range of 150–170{degree}C was observed in thermal-shock tests of bar specimens. Steady-state creep tests indicated 90% dense Li_4SiO_4 fractures at T $\leq$ 800{degree}C before reaching steady state and deforms plastically at 900{degree}C. It is more creep-resistant at 900{degree}C than Li_2O, about equal to Li_2Zr_3, and less than $LiA10_2$. 13 refs., 4 figs., 1 tab.

36927 (CONF-880613—8) In situ HVEM investigation of catastrophic swelling in uranium intermetallic fuels. Birtcher, R.C.; Allen, C.W.; Hofman, G.L.; Rehn, L.E. (Argonne National Lab., IL (USA)). Feb 1988. Contract W-31109-ENG-38. 15p. (CONF-880613—). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009991/JAW.

From 14. international symposium on effects of radiation on materials; Andover, MA, USA (27 Jun 1988).

The swelling of intermetallic materials depends upon the crystalline or amorphous state of the material. When U_3Si is irradiated at temperatures above its amorphization limit, it remains crystalline and does not suffer extraordinary swelling. However, when it is irradiated at temperatures below its amorphization limit, body forces associated with the irradiation cause any internal free volume to suffer a rapid growth, and the material swells at an anomalously fast rate. As has been previously noted, fission-gas bubbles are not directly responsible for this swelling; however, once formed, the bubble volume, as any interior volume, may increase rapidly. An unusual and important result is that once U_3Si has been irradiated to a high fluence, (above 2 {times} 10^{20} Kr m/sup {minus/2}), the irradiation behavior appropriate for the initial irradiation temperature is locked in, at least temporarily, and that behavior persists even at irradiation temperatures that normally result in the opposite behavior. For example, after a 620{degree}K irradiation, the crystalline state is retained during subsequent irradiation at 420{degree}K to more than ten times the fluence required to amorphize unirradiated material at 420{degree}K. 19 refs., 3 figs.

36928 (CONF-8804112—3) Atomistic simulation of silicon grain boundaries. Phillpot, S.R.; Wolf, D. (Argonne National Lab., IL (USA)). Apr 1988. Contract W-31109-ENG-38. 7p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88009925/JAW.

From Interfacial structure, properties and designs in solids; Reno, NV, USA (5 Apr 1988).

The bond-bending and bond-stretching three-body potential of Stillinger and Weber is used to study the energy and structure of grain boundaries in silicon. 10 refs., 3 figs.

36929 (CONF-8806103—1) Factors influencing the toughening behavior of whisker reinforced ceramics. Becher, P.F.; Hsueh, Chung-Hway; Angelini, P.; Tiegs, T.N. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011396/JAW.

From International conference on whisker- and fiber-toughened ceramics; Oak Ridge, TN, USA (7 Jun 1988).

Whisker reinforced ceramics exhibit substantial improvements in fracture toughness and other mechanical properties as compared to the unreinforced ceramics. In many of the whisker reinforced ceramics, enhanced toughness is derived from bridging of the crack by the strong whiskers. An analysis of the whisker bridging contribution reveals that the toughness is a function of the whisker strength, radius, and volume content, the ratio of the Young's modulus of the composite to that of the whisker, and the ratio of the fracture energy of the matrix to that of the whisker-matrix interface. Recent studies show that the analysis based on whisker bridging quantitatively describes the experimentally observed toughening that results from whisker reinforcement. 9 refs., 1 fig.

36930 (CONF-8806155—1) Theoretical and experimental analysis of the toughening behavior of whisker reinforcement in ceramic matrix composites. Becher, P.F.; Hsueh, C.H.; Angelini, P.; Tiegs, T.N. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011841/JAW.

From Symposium on interfacial phenomena in composites; Newport, RI, USA (1 Jun 1988).

Analytical solutions are presented describing the experimentally verified toughening of whisker reinforced ceramics. Clear insights are provided into the interrelationships of whiskers, matrices, and interfaces in the case of strong interfaces with minimized whisker pullout.

36931 (DOE/ER/13411—3) Ligand intermediates in metal catalyzed reactions. Technical report: third budget year. Gladysz, J.A. (Utah Univ., Salt Lake City (USA)). 1 Apr 1988. Contract FG02-85ER13411. 18p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012123/JAW.

A progress report is presented in which a new method for the activation of metal-bound methyl groups and the oxidative disproportionation of coordinated ethylene and methane are discussed. Also considered in the report is the divergent kinetic and thermodynamic acidity in organotransition metal hydride complexes and the synthesis, structure, and reactions of chiral rhenium vinylidene complexes.

36932 (DOE/ER/13622—2) Structural and electronic properties of iron and cobalt molecular sieve catalysts: Progress report. Suib, S.L. (Connecticut Univ., Storrs (USA)). 14 May 1988. Contract FG02-86ER13622. 4p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010537/JAW.

During the second year of this research we have focused on the characterization of highly dispersed cobalt and iron particles in zeolites with transmission electron microscopy and spin echo nuclear magnetic resonance techniques. We have continued our studies of the structure sensitivity of cyclopropane craking reaction. In-situ Moessbauer studies of iron catalysts have also been done. In addition, several ultahigh vacuum methods have been used to characterize metal-containing molecular sieves. The most significant discovery is that spin echo nuclear magnetic resonance (SENMR) methods can be used to determine the structure of small (5--40 angstrom) size particles of cobalt. Both hexagonal and cubic metal particles have been prepared and a new alloy of cobalt and iron has been characterized by SENMR. This is the first example of the use of spin echo nuclear magnetic resonance methods done in zero external magnetic field for supported catalysts. With this method the relaxation times of different cobalt species can be determined.

36933 (DOE/ER/13789—1) Studies of photochemically and electrochemically driven electron transport in zeolites: Progress report, September 1987-April 1988. Mallouk, T.E. (Texas Univ., Austin (USA). Dept. of Chemistry). Apr 1988. Contract FG05-87ER13789. 4p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88008644/JAW.

Electron transfer reactions in zeolites and related solid-state materials are being studied. Some particular areas of study are: Electron transfer reactions of linked sensitizer-acceptor molecules. We have studied via laser flash photolysistransient absorbance the photochemistry of linked Ru(bpy)$_3$--diquat molecules exchanged onto the outer surface of zeolite L powder. Electron-donor quenching of excited-state RuL$_3$ complexes. We have studied electron transfer reactions between cyanometallate anions M(CN)$_6$/sup {4 minus/}(M = Mo,W), M(CN)$_6$/sup {4 minus/}(M = Fe,Os) and excited state ruthenium complexes. Quantum-size TiO_2 in zeolite L. We are attempting to prepare systems in which the conduction band of an oxide semiconductor is used to convey electrons from a sensitizer to a catalyst within a zeolite L particle. Internal platinization of pillared clays. We have photoplatinized dispersed Na^+--montmorillonite, using $PtCl_4$/sup {2 minus/}as the platinum source, and then pillared the clay with A1(OH)$_2$C1 solutions. We are currently investigating the size and charge selectivity of these catalytic materials.

36934 (DOE/ER/45048—5) Photoreflectance spectroscopy of GaAs-Al/sub x/Ga/sub 1-x/As quantum wells under hydrostatic pressure. Kangarlu, A.; Chandrasekhar, H.R.; Chandrasekhar, M.; Chambers, F.A.; Vojak, B.A.; Meese, J.M. (Missouri Univ., Columbia (USA). Dept. of Physics and Astronomy; Amoco Research Center, Naperville, IL (USA)). 1986. Contract AC02-84ER45048. 4p. (CONF-860892—6). NTIS, PC A02;3. Order Number DE88009855/JAW.

From 18. international conference on physics of semiconductors; Stockholm, Sweden (11 Aug 1986).

We present the first study of the effect of hydrostatic pressure on the photoreflectance (PR) spectra of GaAs - Al/sub x/Ga/sub 1{minus/x}As multiple quantum wells (MQW). As the levels in the CB move up in energy with pressure, they interfere with the L band signalled by a loss of intensity as they cross the latter. At pressures beyond 35 kbar the CB of GaAs crosses the L band of GaAs and the X band of the Al/sub x/Ga/sub 1{minus/x}As barrier. Staggered transitions across the interface from the X CB of Al/sub x/Ga/sub 1{minus/x}As to the valence band of GaAs are seen signalling the formation of a type II heterostructure beyond these pressures. The valence band offsets are deduced from this data and are in agreement with our published data of photoluminescence under pressure. The pressure dependence of the L band is also deduced from our results. 7 refs., 3 figs.

36935 (DOE/ER/45104—3) [Synthesis of model polymers and related structures in support of vinyl monomer grafting studies]: Progress report, July 1, 1987-June 30, 1988. Hogen-Esch, T.E.; Butler, G.B. (Florida Univ., Gainesville (USA)). 1988. Contract FG05-84ER45104. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010245/JAW.

Objectives of the present program include the synthesis, structural characterization and properties, of cellulose-based water-soluble graft copolymers and other copolymers capable of effectively enhancing the viscosity of their aqueous solutions. In support of this program we plan the synthesis of a number of water-soluble well defined block- or star block colopymers capable of effectively viscosifying their solutions through reversible crosslinking. In order to understand the effects on the rheology of branching or cyclization in the above systems, we also plan the synthesis of water-soluble cyclic- and star polymers.

36936 (DOE/ER/45114—5) Statistical mechanics of polymer systems: Annual report. Kovac, J. (Tennessee Univ., Knoxville (USA). Dept. of Chemistry). 1 May 1988. Contract FG05-84ER45114. 11p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011172/JAW.

This project involves two different, but complementary, efforts. The first is the development and application of dynamic Monte Carlo computer simulation techniques for the study of polymer dynamics. The second is the study of equilibrium and nonequilibrium aspects of the glass transition. Progress has been made in both areas during the previous year. 8 refs.

36937 (DOE/ER/45123—4) Fundamental studies of elastomers: Annual report, February 16, 1987-March 15, 1988. Eichinger, B.E. (Washington Univ., Seattle (USA). Dept. of Chemistry). 15 Mar 1988. Contract FG06-84ER45123. 16p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009679/JAW.

This progress report describes work in the three areas of (1) computer simulation, (2) theory of the shape distribution of polymer chains, and (3) synthetic projects on elastomers. Areas of study include: the influence of chain scission on the radiation cure of polyethylene; crosslinking in urethane formation; calculations on spherical distributions for linear and circular chains; gel synthesis; derivitization of commercial elastomers to incorporate acetylacetone; synthesis of polysilylenes; polymerization of a strained bicyclic olefin. 6 figs. (CBS)

36938 (DOE/ER/45250—1) Investigations on the MBE [molecular beam epitaxy] growth and properties of Al/sub y/Ga/sub y/In/sub 1-x-y/AsInP and InGaAs-InAlAs superlattices: Progress report for the period February 1, 1987-December 31, 1987. Bhattacharya, P.K.; Gibala, R. (Michigan Univ., Ann Arbor (USA)). 1987. Contract FG02-86ER45250. 46p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009105/JAW.

Focus of the work was to grow wide-bandgap ternary and quaternary semiconductors InAlAs and InGaAlAs by molecular beam epitaxy and to investigate their electronic, optical and structural characteristics. Techniques being used are x-ray, TEM, photoluminescence and absorption, DLTS, Hall transport, and Raman Spectroscopy. Experiments included both lattice matched and strained layers. We have grown a series of InGaAlAs quaternary alloys lattice matched to InP, covering the bandgap range from 0.75 to 1.45 eV. Low-temperature photoluminescence measurements indicate that the layers are possibly the best ever grown. The excitonic linewidths are extremely narrow and indicate minimal amounts of clustering. The hole lifetimes in the alloys are comparable to those in high-purity GaAs. Deep levels in these alloys are being investigated and several dominant trap centers have been identified. Studies are under way to establish their physico-chemical origin. Preliminary Raman Spectroscopy measurements have been done on the same samples and the data are being analyzed. Intention is to establish the GaAs, AlAs and InAs-like phonon spectra as a function of composition. We have realized the narrowest PL excitonic linewidths in InGaAs/GaAs MQWs. The linewidths {approximately} 1-2 meV are almost a factor of 3 better than anything ever reported previously. A proper understanding of strained layer epitaxy by non-equilibrium growth techniques such as MBE is emerging for the first time. 27 figs., 2 tabs.

36939 (DOE/ER/45252—T2) [The mechanical behavior of surface modified ceramics]: Progress report. (Pennsylvania State Univ., University Park (USA)). 1988. Contract FG02-86ER45252. 5p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88010564/JAW.

Ceramics can be strengthened by compressive stresses on the surface. This can be done either thermally (tempering of glasses), chemically (ion exchange, doping) or physically (thermal expansion of surface and bulk). Vicker's indentation techniques were used to estimate the residual stresses on surfaces. Aluminosilicate glass samples were ion exchanged in molten KNO_3 at a constant temperature for 2 min--25 h. The samples were then indented using a Vicker's diamond indentor. An attempt was also made to find a suitable infiltrant for surface modification of alumina with chromia. Solid state diffusion was examined. Samples were heated in powder beds containing Cr_2O_3 and various amounts of CrF_3, 3.5 H_2O (0,5,10,15,20) at 1500{degree}C for various times. Electron microprobe analysis and scanning electron microscopy with x-ray dispersive analysis were used. Residual stresses in thermal barrier coatings were also investigated. Plasma-sprayed thermal barrier coatings (TBC's) applied to superalloy jet turbine blades increase oxidation resistance and allow higher operating temperatures. Due to the plasma-spray process, microstrains and small coherently diffracting regions are introduced into the TBC's. 4 refs.

36940 (DOE/ER/45278—1) Structure and properties of 3 to 5 interfaces: Progress report 87/88. Ast, D.G. (Cornell Univ., Ithaca, NY (USA). Dept. of Materials Science and Engineering). Mar 1988. Contract FG02-86ER45278. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009216/JAW.

We investigated three different aspects of the pseudomorphic system In/sub x/Ga/sub 1-x/As on GaAs. These subsets were: 1) the formation and location of dislocations at the interface between In/sub x/Ga/sub 1-x/As and GaAs (with IBM); 2) the electrical properties of interface dislocations at the emitter base and base collector junctions of inverted and non inverted heterojunction bipolar transistors (with EE Cornell); and 3) the suppression of misfit dislocations in pseudomorphic systems grown well beyond the critical thickness (with IBM). Details of these investigations are listed in the attached publications. Therefore, we will report below only the central ideas and most essential results.

36941 (DP-MS—87-157) Prediction of glass durability as a function of glass composition and test conditions: Thermodynamics and kinetics. Jantzen, C.M. (Savannah River Lab., Aiken, SC (USA)). 1988. Contract AC09-76SR00001. 19p. (CONF-8806111—4). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010893/JAW.

From Conference on the advances in fusion of glass; Alfred, NY, USA (14 Jun 1988).

The long-term durability of nuclear waste glasses can be predicted by comparing their performance to natural and ancient glasses. Glass durability is a function of the kinetic and thermodynamic stability of glass in solution. The relationship between the kinetic and thermodynamic aspects of glass durability can be understood when the relative contributions of glass composition and imposed test conditions are delineated. Glass durability has been shown to be a function of the thermodynamic hydration free energy which can be calculated from the glass composition. Hydration thermodynamics also furnishes a quantitative frame of reference to understand how various test parameters affect glass durability. Linear relationships have been determined between the logarithmic extent of hydration and the calculated hydration free energy for several different test geometries. Different test conditions result in different kinetic reactivity parameters such as the exposed glass surface area (SA), the leachant solution volume (V), and the length of time that the glass is in the leachant (t). Leachate concentrations are known to be a function of the kinetic test parameter (SAV)t. The relative durabilities of glasses, including pure silica, obsidians, nuclear waste glasses, medieval window glasses, and frit glasses define a plane in three dimensional ΔG/sub hyd/-concentration-(SAV)t space. At constant kinetic conditions, e.g., test geometry and test duration, the three dimensional plane is intersected at constant (SAV)t and the ΔG/sub hyd/-concentration plots have similar slopes. The slope represents the natural logarithm of the theoretical slope, (12.303 RT), for the rate of glass dissolution. 53 refs., 4 figs.

36942 (FNAL-TM—1517) Thermophysical properties of argon. Jaques, A. (Fermi National Accelerator Lab., Batavia, IL (USA)). Feb 1988. Contract AC02-76CH03000. 201p. NTIS, PC A10. Order Number DE88010376/JAW.

The entire report consists of tables of thermodynamic properties (including sound velocity, thermal conductivity and diffusivity, Prandtl number, density) of argon at 86 to 400{degree}K, in the form of isobars over 0.9 to 100 bars. (DLC)

36943 (FRCEA-TH—49) Magnetic and superconductive property study of the compounds: $HoMo_6S_8$, $EuMo_6S_8$ and Ce Mo_6S_8. Dinia, M.A. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Dept. de Recherche Fondamentale; Grenoble-1 Univ., 38 (France)). Jul 1987. 173p. (In French). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88753964/JAW.

Magnetic measurements and neutron spectroscopy measurements allowed to conclude that $HoMo_6S_8$ was an Ising system. Neutron diffraction experiments and electric conductivity measurements simultaneously on a $HoMo_6S_8$ monocrystal allowed to set that at null field superconductivity exists not only with the modulated magnetic structure but also with an antiphase magnetic structure (in a narrow temperature range). Superconductivity disparition at low temperature is then not related to the magnetic transition but to the development of magnetic moments of Ho^{3+} ions. Superconducting phase got at low temperature by heating a monodomain ferromagnetic crystal is associated to a reduction of the ordered moment of Ho^{3+} ions, because of an important demagnetizing field. At last, magnetic order evolution study in relation to the magnetic field allowed to precise the phase diagram of $HoMo_6S_8$. A crystal structure study of $EuMo_6S_8$ in the high temperature rhomboedric phase and the low temperature triclinic phase were realized by neutron diffraction. Magnetic order in $EuMo_6S_8$ below T/sub /N = 0.3K was determined.

36944 (IS-T—1335) The crystal and molecular structures of a tricyclic phosphorus ester, a cobalt(III) macrocyclic complex and a trans coordinated platinum(II) compound. Wintergrass, D.J. (Ames Lab., IA (USA)). Nov 1987. Contract W-7405-ENG-82. 74p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE88007354/JAW.

The reaction chemistry and structurebonding features of some new hypercoordinate and strained non-metal compounds have been investigated. In an effort to create a species containing hypervalent phosphorus, 7-hydroxymethyl-4-phospha-3,5,9-trioxa-tricyclo undecane was refluxed for one hour in chloroform. However, the resulting product, 4-hydro-4-oxa-4-phospha-3,5,9-trioxa-tricyclo dodecane did not contain a hypercoordinate phosphorus atom. A molecular structure determination of this phosphonate was carried out to determine the conformation and thereby help elucidate a possible reaction mechanism. A macrocyclic organocobalt compound was prepared by photolysis. The complex which was examined by x-ray crystallography is trans-ethylaquocobalt(1,4,8,11-tetraazacyclotetradecane)perchlorate. Determination of the molecular structure was undertaken. The compound trans-di-chloro-bis-[2,8,9-trimethyl-1-phospha-2,5,8,9-tetraazabicyclo undecane]platinum(II) was prepared by a displacement reaction of the ligand, 2,8,9-trimethyl-1-phospha-2,5,8,9-tetraazabicyclo undecane, and trans-$PtCl_2${center←dot}$2Et_2S$ in either. A molecular structure determination was undertaken to determine the conformation and to complement other spectral analyses. 27 refs., 12 figs., 19 tabs.

36945 (LA—11253-MS) SESAME equation of state No. 7530, basalt. Barnes, J.F.; Lyon, S.P. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 10p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010483/JAW.

A full-range equation of state (EOS) for dry, nonporous basalt with a grain density of 2.868 gcm^3 has been constructed and placed on the SESAME library as material number 7530.

36946 (LBL—24157) Fermi level dependent native defect formation: Consequences for metal-semiconductor and semiconductor-semiconductor interfaces. Walukiewicz, W. (Lawrence Berkeley Lab., CA (USA)). Feb 1988. Contract AC03-76SF00098. 25p. (CONF-880208—1). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008247/JAW.

From 15. annual conference on physics and chemistry of semiconductor interfaces; Asilomar, CA, USA (1 Feb 1988).

The amphoteric native defect model of the Schottky barrier formation is used to analyze the Fermi level pinning at metal/semiconductor interfaces for submonolayer metal coverages. It is assumed that the energy required for defect generation is released in the process of surface back-relaxation. Model calculations for metal/GaAs interfaces show a weak dependence of the Fermi level pinning on the thickness of metal deposited at room temperature. This weak dependence indicates a strong dependence of the defect formation energy on the Fermi level, a unique feature of amphoteric native defects. This result is in very good agreement with experimental data. It is shown that a very distinct asymmetry in the Fermi level pinning on p- and n-type GaAs observed at liquid nitrogen temperatures can be understood in terms of much different recombination rates for amphoteric native defects in those two types of materials. Also, it is demonstrated that the Fermi level stabilization energy, a central concept of the amphoteric defect system, plays a fundamental role in other phenomena in semiconductors such as semiconductor/semiconductor heterointerface intermixing and saturation of free carrier concentration. 33 refs., 6 figs.

36947 (NUCLEBRAS-CDTN—592) Monocrystal growth and characterization of HgI_2 semiconductor compound for using in X and gamma spectrometries. Faria, L.O. (Centro de Desenvolvimento da Tecnologia Nuclear, Belo Horizonte (Brazil)). 1987. 94p. (In Portuguese). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702476/JAW.

Mercury Iodide (HgI_2) platelets were grown from the vapor phase in the presence of polymers. These platelets are convenient to be used as room temperature operating semiconductor radiation detectors. Experiments demonstrate that the growth of platelets depends on a two-stage mass transport instead of depending on just one, as it has been thought. HgI_2 platelets 30 mm^2 large and 90 μm thick were obtained in a sealed evacuated fused quartz tube and were characterized by etch pit density measurements.

36948 (PNL—5577-2-3-4) Fabrication and characterization of MCC [Materials Characterization Center] approved testing material—ATM-2, ATM-3, and ATM-4 glasses. Wald, J.W. (Pacific Northwest Lab., Richland, WA (USA)). Mar 1988. Contract AC06-76RL01830. 28p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008067/JAW.

Materials Characterization Center glasses ATM-2, ATM-3, and ATM-4 are designed to simulate high-level waste glasses that are likely to result from the reprocessing of commercial nuclear reactor fuels. The three Approved Testing Materials (ATMs) are borosilicate glasses based upon the MCC-76-68 glass composition. One radioisotope was added to form each ATM. The radioisotopes added to form ATM-2, ATM-3, and ATM-4 were ^{241}Am, ^{237}Np, and ^{239}Pu, respectively. Each of the ATM lots was produced in a nominal lot size of 450 g from feed stock melted in a nitrogen-atmosphere glove box at 1200{degree}C in a platinum crucible. Each ATM was then cast into bars. Analyzed compositions of these glasses are listed. The nonradioactive elements were analyzed by inductively coupled argon plasma atomic emission spectroscopy (ICP), and the radioisotope analyses were done by alpha energy analysis. Results are discussed. 7 refs., 3 figs., 5 tabs.

36949 (SAND—87-2508C) Plasma treatment of polymers for improved adhesion. Kelber, J.A. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 12p. (CONF-880408—27). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011623/JAW.

From Spring meeting of the Materials Research Society; Reno, NV, USA (4 Apr 1988).

A variety of plasma treatments of polymer surfaces for improved adhesion are reviewed: noble and reactive gas treatment of fluoropolymers; noble and reactive treatment of polyolefins, and plasma-induced amination of polymer fibers. The plasma induced surface chemical and morphological changes are discussed, as are the mechanisms of adhesion to polymeric adhesives, particularly epoxy. Noble gas plasma etching of flouropolymers produces a partially defluorinated, textured surface. The mechanical interlocking of this textured surface is the primary cause of improved adhesion to epoxy. Reactive gas plasmas also induce defluorination, but oxygen containing gases cause continual ablation of the fluoropolymer surface. Noble and reactive gas (exept for hydrogen) etching of polyolefins results in surface oxidation and improved adhesion via hydrogen bonding of these oxygen containing groups across the interface. The introduction of amine groups to a polymer surface by amonia or amine plasma treatment generally results in improved adhesion to epoxy. However, amine-epoxy ring interactions can be severely effected by steric factors due to chemical groups surrounding the amine. 41 refs.

36950 (SAND—87-2667C) Chemical kinetics of hydrogen and P/sub b/ centers. Brower, K.L. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 10p. (CONF-8805116—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010528/JAW.

From Symposium on the physics and chemistry of SiO/sub 2/ and the Si-SiO/sub 2/; Atlanta, GA, USA (15 May 1988).

Electron paramagnetic resonance (EPR) measurements indicate that P/sub b/ centers, which are a dangling-bond type of defect at the (111) $Si-SiO_2$ interface, can be passivated with H_2 at a rate which is proportional to the H_2 concentration in the thermal oxides and the interfacial density of P/sub b/ centers. This process is characterized by an activation energy, E/sub f/, of 1.66 {+-} 0.06 eV with a second-order pre-exponential factor, k/sup (2)//sub of/, of 1.94 ({plus}2.-1) {times} 10/sup {minus/6} cm^3sec for temperatures between 230 and 260{degree}C. The passivation process is demonstrated to be consistent with a chemical process in which H_2 molecules, during the course of their duffusional motion among the accesible interstices of the SiO_2 network and the reaction site at P/sub b/ centers, react directly with P/sub b/ centers. EPR measurements indicate that passivated P/sub b/ centers, denoted as HP/sub b/, in effect dissociate in vacuum above 550{degree}C. 18 refs., 5 figs.

36951 (SAND—88-0044C) Light element redistribution and property changes in insulators due to ion bombardment and chemical processing. Arnold, G.W. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 29p. (CONF-8806145—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011687/JAW.

From 6. international conferene on ion beam modification of materials; Tokyo, Japan (12 Jun 1988).

Ion-implantation into certain classes of insulating materials results in compositional changes due to loss of material from the implanted region. These changes may be accompanied by the incorporation of ambient H. Crystalline $LiNbO_3$ (Li-loss) and alkali-silicate glasses (alkali-loss) are materials which exhibit such changes. In both cases, radiation-enhanced diffusion has been invoked for the heavy-ion losses. The compositional changes in the implanted region of alkali-silicate glasses can bring about phase-separation and crystallization with consequent significant physical property changes. Ion-implantation of H into SiO_2 (glassy and crystalline) has proved useful in determining the number of interstitial sites in these materials and a direct confirmation of indirectly obtained free-volume fraction values.

36952 (SAND—88-0053C) Physical and electrical properties of oxides grown on carbon-implanted silicon. Arnold, G.W.; Schubert, W.K.; Seager, C.H.; Carr, M.J.; Nelson, G.C.; Doyle, B.L. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 15p. (CONF-8806152—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011789/JAW.

From Shanghai workshop on characterization of ion implantation in silicon; Shanghai, China (2 Jun 1988).

The effects of C on gate-oxide integrity have been quantified by implanting C into <100> Si and growing an oxide (~ 400 A) which incorporates the C as the Si is consumed. Implants of 10^{12}, 10^{13}, 10^{14}, and 10^{15} 10 keV C (R/sub p/ ~ 40 A) were followed by damage anneals at 800°C, gate oxide growth at 1100°C, and a final 1000°C anneal in N_2/O_2. I-V curves showed significant lowering of breakdown field at fluences as low as $10^{13}/cm^2$ and degradation at $10^{13}/cm^2$. 24 MeV Si elastic recoil detection (ERD), secondary ion mass spectrometry (SIMS), and Auger electron spectroscopy (AES) profiling of C implants showed small accumulations of C by the growing oxide relative to that left in the Si.

36953 (SAND—88-0221C) PECVD of amorphous nickel–phosphorus films. Hays, A.K.; Nelson, G.C.; Seager, C.H. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 2p. (CONF-880383—2). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88011088/JAW.

From AT and T Task Group V meeting; Albuquerque, NM, USA (22 Mar 1988).

We have developed a plasma deposition technique capable of producing amorphous transition metal-metalloid coatings. The technique consists of decomposing gas mixtures containing transition metal carbonyls and metalloid hydrides in a radiofrequency discharge. Nickel-phosphorus was chosen as a proof-of-principle film for this work. The key to obtaining amorphous metals, as opposed to amorphous metal oxides, lies in the use of a hydrogen carrier gas to remove unwanted oxygen in the form of water as a gaseous by-product. In addition it was discovered that carbon could be completely removed from these films by heating the substrates slightly above room temperatures. 1 ref.

36954 (SAND—88-1131C) Adhesion of hydrated silicate films. Michalske, T.A.; Keefer, K.D. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 11p. (CONF-880408—24). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011250/JAW.

From Spring meeting of the Materials Research Society; Reno, NV, USA (4 Apr 1988).

We used fracture mechanics test techniques to measure the adhesive bond energy formed between hydrated silica glass surfaces and silicate species deposited from solution. In the case of silicate surfaces hydrated in room temperature water vapor, intermolecular bonding between hydrated surfaces can be attributed to either hydrogen bonding interactions between adsorbed water molecules (0.15 Jm^2) or electrostatic bonds formed between adsorbed cations and anionic-nonbridging surface oxygen groups (2.0 Jm^2). The bonding interaction observed at room temperature depends upon the glass surface composition and the degree of surface hydration. When hydrated silicate solution species are added to the interface and heat treated, adhesion energies as large as the cohesive energy of silica glass can be obtained with heat treatments as low as 200{degree}C. The adhesion of the silicate interfacial film produced by the addition of solution species is greatest for silicate precursors showing a low degree of molecular crosslinking. In addition, the presence of alkali in the silicate solution greatly enhances interface adhesion for heat treatments below 200{degree}C. 9 refs., 10 figs.

36955 (SAND—88-1213C) Precursor chemistry and the structure of silica aerogels. Schaefer, D.W.; Brinker, C.J.; Wilcoxon, J.P.; Wu, D.Q.; Phillips, J.; Chu, B. (Sandia National Labs., Albuquerque, NM (USA); State Univ. of New York, Stony Brook (USA). Dept. of Chemistry). 1988. Contract AC04-76DP00789. 5p. (CONF-880408—25). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011253/JAW.

From Spring meeting of the Materials Research Society; Reno, NV, USA (4 Apr 1988).

Small-angle X-ray scattering is used to characterize the structure of aerogels prepared by two-stage polymerization processes. Second-stage catalysis controls the resistance to collapse during drying with base-catalyzed system being most resistant. We find the origin of this resistance in the solution precursor chemistry. Base catalysis in the second stage leads to compaction of the polymer network on short length scales. This short-scale rigidity makes the networks sufficiently robust to withstand the surface tension forces present during drying. Aging in solution also improves aerogel quality. In this case, a dissolution-repolymerization process leads to short length scale circuits and improved rigidity. 12 refs., 2 figs.

36956 (SAND—88-1313C) Laser probes and numerical modeling as process diagnostics in chemical vapor deposition. Breiland, W.G.; Ho, P.; Coltrin, M.E.; Kee, R.J.; Evans, G.H. (Sandia National Labs., Albuquerque, NM (USA); Sandia National Labs., Livermore, CA (USA)). 1988. Contract AC04-76DP00789. 12p. (CONF-880408—26). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011622/JAW.

From Spring meeting of the Materials Research Society; Reno, NV, USA (4 Apr 1988).

The chemical vapor deposition process consists of a chemically reacting flow in which the fluid mechanics and chemical kinetics are strongly coupled. Laser probes such as Raman spectroscopy and laser induced fluorescence can be used to measure gas temperature fields and chemical species concentrations, but often the interpretation of such data is difficult because several interacting chemical and physical phenomena are occurring simultaneously. Detailed numerical modeling of the experimental system under study provides valuable insights into these interactions and allows one to make useful comparisons between experiment and the model to gain a fundamental understanding of the CVD process. Examples of this approach are given for silicon deposition from silane and fluid mechanics diagnostics in a rotating disk CVD reactor. 19 refs., 8 figs.

36957 (SAND—88-1453C) Refractory films from spin-cast carbon. Renschler, C.L.; Sylwester, A.P. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 10p. (CONF-880669—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011251/JAW.

From International conference on science and technology of synthetic metals; Santa Fe, NM, USA (26 Jun 1988).

A method is described to produce thin films of carbon by the pyrolysis of spin-cast polyacrylonitrile. Uv, ir, and Raman spectroscopies were employed to investigate the chemical structure of the films during pyrolysis. The electrical conductivity of films made in this way can be varied over several decades by changing the final temperature of carbonization. These films can also be photolithographically patterned and manipulated by wet and dry trans-

fer techniques. As such, these films may have utility in microelectronic and hybrid microcircuit applications. 7 refs., 4 figs.

36958 (SAND—88-1595C) Formation and characterization of inorganic membranes from zeolite-silica microcomposites. Bein, T.; Brown, K.; Enzel, P.; Brinker, C.J. (New Mexico Univ., Albuquerque (USA). Dept. of Chemistry; Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 6p. (CONF-880408—30). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011913/JAW.

From Spring meeting of the Materials Research Society; Reno, NV, USA (4 Apr 1988).

Small crystals of zeolites (500-1000 nm) with two- and three-dimensional channel systems (faujasite and ZSM-5 structures) were embedded in amorphous thin films derived from TEOS hydrolyzed in alcoholic solution. Scanning electron microscopy studies show that the zeolites can be quite evenly dispersed in the membrane, resulting in single layers of zeolite crystals protruding out of the amorphous matrix. In situ FT-IR studies with a series of probe molecules revealed that in most membranes the zeolites were 100% accessible from the gas phase. The membranes excluded molecules which are larger than the pore openings of the zeolite embedded in the composite.

36959 (SAND—88-8219) Temperature, moisture, and strain rate effects on the compressive mechanical behavior of Nylon 6/6. Kawahara, W.A.; Brandon, S.L.; Korellis, J.S. (Sandia National Labs., Livermore, CA (USA)). Apr 1988. Contract AC04-76DP00789. 35p. NTIS, PC A03;3. Order Number DE88010734/JAW.

Material test results are presented for the mechanical behavior of Nylon 66 in compression. Static compression modes include direct compression, stress relaxation and creep. Dynamic direct compression results are included. Tests are performed at atmospheric pressure; strain rates range from 10/sup {minus/4}sec to 10^2sec; temperatures are 20, 65, 110, 150 and 200{degree}C; moisture levels are 0% (dry), 2% and 6% (saturated); true strains to {minus}0.25 are imposed. Our empirical Temperature-Moisture equivalence of 14{degree}C per 1% moisture is discussed with respect to the {open‹–quotes}free volume{close‹–quotes} concept.

36960 (SVF—252) Study of existing and expected materials problems in steam power plants. Poturaj, S.; Groenwall, B.; Haeggblom, E. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Feb 1987. 51p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752980/JAW.

The present work comprises three parts: - Materials problems and thereby caused failures in Swedish steam power plants which have been overviewed by questionnaire, - an evaluation of the causes of the corrosion damages of the austenitic superheater tubes at Hallstavik paper mill, - a study of materials selection in foreign power plants, especially plants with high steam conditions. The failures concern all steps from fuel feeding and damages in the furnace, to exhaust gas fans. In Hallstavik, stress corrosion cracking has occurred in the austenitic 16Cr13Ni1Nb austenitic superheater tubes. The cracking was caused by residual stresses in cold worked bends combined with a water containing chloride. From the materials selection study, it is concluded that technology today exists to build a pulverized coal power plant with double reheat steam conditions up to 310 bar and 565 degrees C. (authors).

36961 (UCID—21349) Optical coatings for high average power XeF lasers: Final report. Milam, D.; Thomas, I.; Wilder, J.; George, D. (Lawrence Livermore National Lab., CA (USA)). 16 Mar 1988. Contract W-7405-ENG-48. 50p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011356/JAW.

Porous silica, calcium and magnesium fluorides were investigated for potential use as antireflective coatings for XeF lasers. Excellent optical properties were obtained for all types, and laser damage thresholds were in the range 18-25 Jcm^2 at 350 nm for 25 ns pulses at 25 Hz pulse repetition frequency. Studies of the effects of the XeF laser environment on these coatings were incomplete. Three oxides, ZrO_2, HfO_2, and Ta_2O_5 were investigated as the high index components to be paired with low index porous SiO_2 for highly reflective dielectric coatings. Single oxide layers had indices in the 1.7-1.8 range and HfO_2 coatings had the highest damage threshold at about 5 Jcm^2. An unexpected problem arose on attempts to prepare multilayer coatings. Stress in the coating after 6-8 layers had been put down, gave rise to crazing and peeling. This could not be avoided even on extending the curing process between coats.

36962 (UCRL—97598) Improved adhesion for SiO_2 particles in silica substrates using helium-ion irradiation. Musket, R.G.; Thomas, I.M. (Lawrence Berkeley Lab., CA (USA)). Mar 1988. Contract W-7405-ENG-48. 6p. (CONF-880408—14). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008915/JAW.

From Spring meeting of the Materials Research Society; Reno, NV, USA (4 Apr 1988).

We have examined the effects of irradiation with 200-keV helium ions on the adhesion and optical transmission properties of 220 nm thick antireflective, optical coatings that consisted of layers of spherical, 20 nm diameter silica particles. In the as-deposited state these sol-gel coatings have very low adhesion to the fused silica subtrates. Results for adhesion and optical transmission have been obtained for doses of 10^{15}-10^{17} $Hecm^2$. Significant improvement in adhesion was found for doses exceeding about 2 {times} 10^{14} $Hecm^2$. Optical transmission measurements for wavelengths of 200-1200 nm showed increasing absorption with dose. We have evidence that the helium ions decompose various contaminants in the coating into two types of degradation products. One is volatile and the other remains in the coating as optically absorbing species. UVoxidative-gas treatment effectively removes the absorbing species.

36963 (UCRL—97773) A molecular view of bulk deformation. Cook, R. (Lawrence Livermore National Lab., CA (USA)). 20 Nov 1987. Contract W-7405-ENG-48. 10p. (CONF-8806139—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011344/JAW.

From Symposium on computer applications in applied polymer science; Toronto, Canada (5 Jun 1988).

In the work reported here, we have examined the conformational geometry and energetics associated with the gauche to trans transition in polymer chains by examining the extension of a four atom chain orginally in a gauche configuration, as well as six and eight atom chains in tgt and ttgtt configurations, respectively. We have examined these systems with constraining force constant, γ/ sub c/, that varies from zero to values high enough to suppress almost all translational motion normal to the chain direction, effectively eliminating the torsional gauche to trans motion. Our particular interest is in energy storage, thus we have followed the energy stored in the bond lengths, backbone bond angles and torsional angles as a function of chain extension and the magnitude of the constraining force. 7 refs., 2 figs.

36964 (UCRL—97912) Observations made during stretching, tearing and failure of NR [natural rubber] and SBR [styrene-butadiene rubber] loaded with various amounts of carbon black. Goldberg, A.; Lesuer, D.R.; Patt, J. (Lawrence Livermore National Lab., CA (USA); Army Tank-Automotive Command, Warren, MI (USA)). 1 Feb 1988. Contract W-7405-ENG-48. 27p. (CONF-880480—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008030/JAW.

From Severe environment symposium; Dallas, TX, USA (19 Apr 1988).

In order to effectively utilize fractography as an aid in identifying the influence of material and service (or test) parameters on material properties, one must first understand the origin of the morphological features developed during the tearing and fracturing of these elastomers. At our laboratory, we have made extensive fractographic studies while evaluating the effects of material formulations, temperature, and loading rates on the loading response, tearing energy, induced damage, and tearing phenomena in SBR (Styrene Butadiene Rubber) containing different amounts of CB (Carbon Black) filler. We have also examined failures in tank track pads, as well as laboratory-tested samples cut from new track pads. In this paper we report on observations made during the actual

stretching, tearing and failure of elastomeric samples pulled in tension at a constraint stroke-diplacement rate. 15 refs., 12 figs.

36965 Thermodynamic properties and equation of state of dense fluid nitrogen. Belak, J.; Etters, R.D.; LeSar, R. (Physics Department, Colorado State University, Fort Collins, Colorado 80523). *Journal of Chemical Physics;* **89**: No. 3, 1625-1633(1 Aug 1988).

Results of constant-pressure Monte Carlo calculations on dense fluid nitrogen over a pressure range of 2 to 300 kbar and a temperature range of 300—3000 K are presented. From analytic fits to the calculated volumes, enthalpies and vibrational frequency shifts, a comprehensive set of thermodynamic quantities is derived, including: thermal expansivity, compressibility, specific heat, Grueneisen parameter, and speed of sound. Comparison of the theoretical results to experiment at room temperature shows very good agreement (within 0.3% in volume and 1% in speed of sound, for instance). Good agreement is also obtained with earlier simulation data. In agreement with experimental studies of fluid metals, we find that the speed of sound varies linearly with density; along isotherms as well as along the Hugoniot. We find that rhoγ/sub G/ , the density times the Grueneisen parameter, which is assumed to be a constant in an often-used phenomenological equation of state, varies considerably with density and temperature. Comparison is made with results from a "soft sphere" model presented in an accompanying paper.

36966 Photoluminescence and the band structure of InAsSb strained-layer superlattices. Kurtz, S.R.; Osbourn, G.C.; Biefeld, R.M.; Lee, S.R. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Applied Physics Letters;* **53**: No. 3, 216-218(18 Jul 1988).

Infrared photoluminescence measurements were performed on InAs/sub 0.13/Sb/sub 0.87/ /InSb strained-layer superlattices. In thick layered structures we observed very low energy transitions proving that a type II superlattice occurs in the InAsSb system. Band structures were calculated based on estimates of the band offsets and strain shifts obtained from the photoluminescence data.

36967 Minority-carrier properties of GaAs on silicon. Ahrenkiel, R.K.; Al-Jassim, M.M.; Dunlavy, D.J.; Jones, K.M.; Vernon, S.M.; Tobin, S.P.; Haven, V.E. (Solar Energy Research Institute, Golden, Colorado 80401). *Applied Physics Letters;* **53**: No. 3, 222-224(18 Jul 1988).

The minority-carrier lifetimes of the heteroepitaxial system of GaAs on Si are limited by recombination at mismatch dislocations. Here we show that increasing the thickness of the buffer layer, with an additional annealing step, reduces the dislocation density by about an order of magnitude. At the same time, the minority-carrier lifetime in these double heterostructures increases more than an order of magnitude.

36968 Effects of high carbon concentration upon oxygen precipitation and related phenomena in CzSi. Hahn, S.; Arst, M.; Ritz, K.N.; Shatas, S.; Stein, H.J.; Rek, Z.U.; Tiller, W.A. (Siltec Corporation, 190 Independence Drive, Menlo Park, California 94025). *Journal of Applied Physics;* **64**: No. 2, 849-855(15 Jul 1988).

Effects of high carbon concentration upon oxygen precipitation and related phenomena in Czochralski (Cz) silicon have been investigated by combining various furnace and rapid thermal anneals. Our data show that oxide precipitate (OP) density, estimated from changes in interstitial oxygen concentration (ΔO/sub i/), increases with increasing substitutional carbon concentration, C/sub s/, while thermal donor (TD) formation is inhibited at high C/sub s/. Even though ΔO/sub i/ increases monotonically with C/sub s/, synchrotron radiation section topographs of processed high carbon content wafers (C/sub s/∼4 ppma) exhibit Pendelloesung fringes, indicating a strain-free bulk state. Our transmission electron microscope and optical microscopic data also show very few resolvable structural defects associated with precipitates inside the bulk Si. Using a thermodynamic and kinetic model, we attempt to explain: (1) reduced thermal donor formation, (2) lack of bulk stress notwithstanding high ΔO/sub i/, and (3) predominantly polyhedral precipitate morphologies in high carbon content CzSi.

36969 Sensitivity of diffusion length determination on background current collection efficiency in light beam induced current analysis using the Zook equation. Field, H.; Ast, D. (Department of Materials Science and Engineering, Cornell University, Ithaca, New York 14853). *Journal of Applied Physics;* **64**: No. 2, 955-956(15 Jul 1988).

The fall-off of the light beam induced current in the vicinity of a grain boundary is frequently used to determine the minority-carrier diffusion length in the vicinity of the boundary and the surface recombination velocity at the boundary. It is shown that the numerical values obtained can be very sensitive to the choice of the background.

36970 High-pressure neutron-scattering studies of graphite and stage-two graphite-$SbCl_5$. Alzyab, B.; Perry, C.H.; Zahopoulos, C.; Pringle, O.A.; Nicklow, R.M. (Physics Department, Northeastern University, Boston, Massachusetts 02115). *Physical Review [Section] B: Condensed Matter;* **38**: No. 2, 1544-1547(15 Jul 1988).

The longitudinal-acoustic (LA) phonons propagating along the c axis in highly oriented pyrolytic graphite (HOPG) were investigated as a function of pressure up to 20 kbar using inelastic-neutron-scattering techniques. The phonon frequencies varied as $\nu(P,q) = A(P)\sin[c(P)q/2]$, where A(P) and c(P) indicate the pressure dependences of the zone-center LO frequency of B_1/sub g// sub >1/ symmetry and of the c-axis lattice spacing, respectively. From the measurements, the mode Grueneisen parameter for the LA branch was estimated to be 1.5 x 10/sup -2/ kbar/sup -1/ (independent of q); the elastic constant C/sub 33/ for HOPG was found to be 3.40 x 10/sup 11/ dyn/cm^2 at 1 bar with a pressure coefficient of (1/C/sub 33/)(dC/sub 33//dP) = 2.91 x 10/sup -2/ kbar/sup -1/. The measured c-axis spacings were 6.71 and 12.72 A for HOPG and stage-2 $SbCl_5$-intercalated graphite, respectively, at atmospheric pressure; the corresponding compressibilities (1/c)(dc/dP) were -2.24 x 10/sup -3/ kbar/sup -1/ (HOPG) and -2.28 x 10/sup -3/ kbar/sup -1/ ($SbCl_5$). Elastic-neutron-scattering studies up to 20 kbar were undertaken to search for stage transformations, but no evidence of any phase transition was observed.

36971 Work hardening and strain relaxation in strained-layer buffers. Dodson, B.W. (Sandia National Laboratories, Albuquerque, New Mexico 87185-5800). *Applied Physics Letters;* **53**: No. 1, 37-38(4 Jul 1988).

Fully relaxed buffer layers are of considerable importance for growth of high quality crystals on substrates having different lattice parameters. Recent experiments by Biefeld et al. [R. M. Biefeld, C. R. Hills, and S. R. Lee, J. Cryst. Growth (in press)] in the InAsSb system show that the degree of relaxation is considerably less than expected using conventional equilibrium models, but is more complete in continuously graded than in step-graded buffer layers. In the present letter, this observation is explained in terms of Taylor-type (dislocation interaction) work hardening.

36972 Thermodynamics of isotopic polymer mixtures: Significance of local structural symmetry. Bates, F.S.; Muthukumar, M.; Wignall, G.D.; Fetters, L.J. (AT&T Bell Laboratories, Murray Hill, New Jersey 07974). *Journal of Chemical Physics;* **89**: No. 1, 535-544(1 Jul 1988).

The dependence on composition (Phi) and degree of polymerization (N) of the effective segment—segment interaction parameter, chi-tilde = - 1/2 partial$^2\Gamma$/partialPhi^2, has been determined for mixtures of perdeuterated and normal (protonated) poly(vinylethylene) and poly(ethylethylene) by small angle neutron scattering (SANS), where Γ represents the excess free energy of mixing. Owing to the small reduction in length and polarizability of carbon—hydrogen bonds with deuterium substitution, isotopic polymer mixtures are characterized by small positive chi-tilde parameters. However, deuterium substitution does not significantly influence the local structural symmetry (i.e., the liquid structure or reduced thermodynamic properties) of polymer isotopes, consistent with the assumptions of Flory—Huggins (FH) lattice theory. Nevertheless, we find that chi-tilde depends significantly on both Phi and N, contrary to the predictions of FH theory. A general theory, which corrects FH theory for monomer concentration fluctuations, is shown to closely account for these experimental results. In un-

derstanding the previous experimental investigations of chi-tilde for mixing chemically different species, the monomer concentration fluctuations discussed here must be addressed in addition to the effects due to local structural asymmetry.

36973 **Intrachain flexibility constraints on phase stabilities and odd-even effects in multiple smectic-A and nematic liquid crystals.** Dowell, F. (Theoretical Division, Los Alamos National Laboratory, University of California, Los Alamos, New Mexico 87545). *Physical Review [Section] A: General Physics;* **38**: No. 1, 382-394(1 Jul 1988).

The importance of the flexibility of n-alkyl tail chains in real liquid-crystal systems is reviewed. Two new microscopic, molecular statistical-physics theories (a full statistical theory and a simpler but accurate approximate theory) for the intrachain constraints on the n-alkyl tail-chain flexibility are presented and are compared with each other and with an old, more approximate theory for tail-chain flexibility used in earlier papers. The new approximate approach is computationally much faster than the full statistical method and is the first treatment to generate and explain odd-even effects in multiple smectic-A phases and the first treatment to generate and explain odd-even effects in smectic-A and nematic phases without resorting to ad hoc or arbitrarily adjustable fits to experimental data. Phase stabilities and odd-even effects for various thermodynamic and molecular ordering properties are calculated in the smectic-A_1, smectic-A/sub d/, and nematic liquid-crystal phases and the isotropic liquid phase using the new approximate method. Some predictions and accompanying physical explanations are made for various systems that have not yet been chemically synthesized and/or experimentally studied.

36974 **Electron motion in the gases CF_4, C_2F_6, C_3F_8, and n-C_4F/sub 10/.** Hunter, S.R.; Carter, J.G.; Christophorou, L.G. (Atomic, Molecular and High Voltage Physics Group, Health and Safety Research Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831). *Physical Review [Section] A: General Physics;* **38**: No. 1, 58-69(1 Jul 1988).

The drift velocity w of electrons has been measured in the perfluoroalkanes n-C/sub N/F_2/sub N//sub +2/ (N = 1—4) over the density-reduced electric field (E/N) range 0.03 x 10/sup -17/ V $cm^2 \leqq E/N \leqq 500$ x 10/sup -17/ V cm^2 using a pulsed Townsend experimental method. The present measurements of w are the first to be obtained for C_2F_6, C_3F_8, and n-C_4F/sub 10/ at low E/N values. The electron-drift-velocity measurements in C_3F_8 and n-C_4F/sub 10/ are dependent on gas pressure at high E/N values, even after allowing for nonequilibrium and boundary corrections to the measured electron swarm transit time. This is the first observation of a pressure dependence in the electron drift velocity in these gases and is believed to be due to changes in the electron energy distribution function f(epsilon-c,E/N) with gas pressure resulting from increases in the density-normalized electron attachment coefficient eta/N with gas pressure. The perfluoroalkanes CF_4, C_2F_6, and C_3F_8 exhibit regions of pronounced negative differential conductivity (NDC) similar to but smaller in magnitude than that in CH_4. Possible mechanisms leading to the observation of NDC effects in these molecular gases are discussed.

36975 **Analytical and numerical modeling of columnar evolution in thin films.** Srolovitz, D.J.; Mazor, A.; Bukiet, B.G. (Department of Materials Science and Engineering, University of Michigan, Ann Arbor, Michigan 48109). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **6**: No. 4, 2371-2380(Jul 1988).

A theory for the growth of columnar microstructure in thin films is presented. The zone II columnar microstructure is shown to result from a balance between shadowing (which results in zone I microstructures) and surface diffusion (which tends to smooth the surface). The zone I to zone II transition temperature is predicted together with the type of unstable modes. The surface morphology and the columnar grain structure are obtained both analytically and numerically. The scaling behavior of the grain size with film thickness is derived. Monte Carlo computer simulations follow the temporal evolution of three-dimensional zone II microstructures, and account for growth competition between adjacent grains, and the formation of film texture. These results agree with experimental data.

36976 **Structure and properties of sputtered carbon overcoats on rigid magnetic media disks.** Tsai, H.; Bogy, D.B.; Kundmann, M.K.; Veirs, D.K.; Hilton, M.R.; Mayer, S.T. (Department of Mechanical Engineering, University of California, Berkeley, California 94720). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **6**: No. 4, 2307-2315(Jul 1988).

Sputtered carbon overcoats on commercial rigid disks with thin-film magnetic media are studied using transmission electron analysis (microscopy, microdiffraction, and energy-loss spectroscopy), Raman spectroscopy, Auger spectroscopy, ellipsometry, x-ray diffraction, and microhardness testing. Data from transmission electron analysis, Raman spectroscopy, and ellipsometry suggest that the carbon overcoats are composed of small graphite crystallites ($\leqq$2 nm), randomly oriented, with a small percentage (0%—5%) of fourfold coordinated carbon bonds. Auger spectroscopy and transmission electron energy-loss spectroscopy indicate the presence of a small amount of oxygen. Auger spectroscopy also shows some surface nitrogen. The optical constants, n = 2.1 and k = 0.78, exhibit a small wavelength dependence. In addition, the extinction coefficient k shows a dependence upon film thickness. X-ray diffraction and microhardness testing did not yield any information concerning the carbon overcoats. There was no indication of diamond from any of the techniques which distinguish between diamond and other forms of carbon. Differences in structure and bonding are seen with Raman spectroscopy in samples from different manufacturers and in annealed samples.

36977 **Sudden and adiabatic polarization effects in doped rare gases.** Koehler, A.M.; Saile, V.; Reininger, R.; Findley, G.L. (Hamburger Synchrotronstrahlungslabor (HASYLAB), Deutsches Elektronen-Synchrotron (DESY), D-2000 Hamburg 52, Federal Republic of Germany). *Physical Review Letters;* **60**: No. 26, 2727-2730(27 Jun 1988).

The evolution of both the sudden and adiabatic polarization energies resulting from a rare gas interacting with a dopant ion was followed for the first time. The variation of these two polarization energies was determined by means of photoabsorption and photoionization up to rare-gas number densities of (23.0, 24.0, 11.3, and 6.6) x 10^{20} cm^{-3} for He, Ne, Ar, and Kr, respectively. Both polarization energies were found to vary linearly with rare-gas number density. However, the slopes differ by more than 1 order of magnitude. This difference is explained in terms of a model which accounts for the different time scales of the two experiments.

36978 **Effect of thermal blooming on pulse propagation through vaporizing aerosols.** Chitanvis, S.M.; Zardecki, A. (Los Alamos National Laboratory, Theoretical Division, Los Alamos, New Mexico 87545). *Applied Optics;* **27**: No. 12, 2495-2501(15 Jun 1988).

The effect of thermal blooming in the air is formulated within the framework of the radiative transfer equation. This is accompliahed on the basis of the ray optics approach and the notion of an effective time-dependent absorption coefficient that describes the changes in the phase of the electric field caused by thermal blooming. In this approach, the beam spreading effects are entirely due to scattering from the aerosol cloud; the effect of vaporization of aerosols leads to nonlinear coupling of the aerosols to radiation. The general setup is used to model numerically the propagation of a high energy laser beam through a cloud of aerosols distributed in the atmosphere. The limitations of the approach are outlined.

36979 **Supercooling and nucleation of silicon after laser melting.** Stiffler, S.R.; Thompson, M.O.; Peercy, P.S. (Department of Materials Science, Cornell University, Ithaca, New York 14853). *Physical Review Letters;* **60**: No. 24, 2519-2522(13 Jun 1988).

Bulk nucleation of crystalline Si at a supercooling of 505 K was observed following pulsed-laser—induced melting of thin films. If the nucleation was homogeneous, the estimated nucleation rate of 10^{30} eventsm^3 s implies a liquid-Si—crystalline-Si interfacial energy of 0.45 +- 0.02 Jm^2. In addition, observation of crystalline nucleation bounds the interface energy between amorphous Si and liquid Si to be >0.20 Jm^2. This laser melting technique is applicable to nucleation studies in a wide variety of materials.

36980 Ferromagnetism in molecular materials: Decamethylferrocenium tetracyanoethanide (DMeFc) (TCNE) (invited). Epstein, A.J.; Chittipeddi, S.; Chakraborty, A.; Miller, J.S. (Department of Physics and Department of Chemistry, The Ohio State University, Columbus, Ohio 43210-1106). *Journal of Applied Physics;* **63**: No. 8, 2952-2956(15 Apr 1988).

Ferromagnetism has only recently been observed in molecular materials. We present here a summary of the ferromagnetic phenomena observed in the molecular charge transfer salt, decamethylferrocenium tetracyanoethanide (DMeFc)(TCNE), and related compounds. A spontaneous magnetization is observed in this material for T<4.8 K, with a saturation moment in agreement with alignment of individual spins localized on the $DMeFc^{+}$/sup x/ and $TCNE^{-}$/sup x/ ions. A comparison of these results with analogous charge transfer salts is presented. Models for the magnetic interaction in the charge transfer salts and the preparation of other molecular and/or polymeric materials with ferromagnetic exchange are presented.

36981 Semiconductor junction formation by directed heat. Campbell, R.B. (to Dept. of Energy, Washington, DC). US Patent 4,729,962. 8 Mar 1988. Filed date 24 Mar 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

The method of forming semiconductor junctions in a dendritic silicon web of either P- or N-type is described comprising: applying a single coating of a liquid precursor solvent containing a dopant of a type opposite that of the web to one face of the web; applying a single coating of a liquid precursory solvent containing a dopant of a type the same as that of the web to the opposite face of the web; then baking the web in an oven at approximately 200°C for approximately 20 minutes to remove excessive solvent; then heating the web rapidly with a high intensity light for a period in the range of 15 seconds to attain temperatures in a range from about 950°C to 1200°C to simultaneously form junctions in both faces of the web; and then annealing the web in air following the rapid heating.

36982 Shear-lag analysis of fiber push-out (indentation) tests for estimating interfacial friction stress in ceramic-matrix composites. Shetty, D.K. (Dept. of Materials Science and Engineering, Univ. of Utah, Salt Lake City, UT (US)). *Journal of the American Ceramic Society;* **71**: No. 2, C-107-C-109(Feb 1988).

A shear-lag analysis is presented for estimating sliding friction stress at fiber-matrix interfaces in ceramic-matrix composites using the single-fiber push-out test. The analysis includes an approximate correction for the increased interfacial compression and, therefore, the interfacial friction stress arising from the transverse (Poisson) expansion of the fibers subjected to the compressive load. An exponential decrease of the interfacial shear stress along the fiber length is predicted. This result is similar to the results of a finite-element analysis reported in the literature. The analysis also provides a basis for the experimental determination of a coefficient of interfacial friction (μ) and a residual interfacial compression (σ/sub O/). It is shown that the sliding friction stress (tau/sub f/ $=\mu\sigma$/sub O/) can be overestimated if the transverse expansion of the fibers is not taken into account.

36983 Transient radiation effects in SOI static RAM cells. Mikawa, R.E.; Ackerman, M.R. (Sandia National Labs., Albuquerque, NM 87185 (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-34**: No. 6, 1698-1703(Dec 1987). (CONF-8707112—). Contract AC04-76DP00789.

From Annual conference on nuclear and space radiation effects; Snowmass Village, CO, USA (28 Jul 1987).

Recent transient radiation experiments have shown a substrate bias dependence on the logic upset levels of a silicon-on-insulator (SOI) technology. From this data, it was concluded that secondary photocurrents generated by the parasitic bipolar junction transistors (BJTs) were responsible for the observed difference in the bias dependent transient radiation induced upset thresholds. In this report we present our results obtained from computer simulations of the transient radiation response of the SOI technology. These results support a possible explanation for the bias dependent logic upset levels experimentally observed. Parasitic BJT gain calculations, gain modulation and substrate bias effects on transient upset thresholds in static random access memory (SRAM) cells are discussed.

36984 A programmable test system for transient annealing characterization of irradiated MOSFETS. Tausch, H.J.; Wemhoner, R.; Pease, R.L.; Schwank, J.R.; Maier, R.J. (Design Engineering Inc., 4725 Lumber Avenue NE., Suite 1, Albuquerque, NM (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-34**: No. 6, 1763-1768(Dec 1987). (CONF-8707112—).

From Annual conference on nuclear and space radiation effects; Snowmass Village, CO, USA (28 Jul 1987).

A current programmable, computer controlled Transient Annealing Test System (TATS) for making complete MOSFET I-V measurements is described. The system forces source currents from 100 pA to 10 mA and measure corresponding gate voltages starting at times as early as 100 μs after a radiation pulse. Features of the system include multiple independent test channels, temperature control over the full military range and completely programmable test/bias sequences. Applications of the system include: a) transient failure mechanism studies, b) in-source testing, and c) high throughput wafer level hardness assurance testing.

36985 Radiation-tolerant, sidewall-hardened SOI/MOS transistors. Tsao, S.S.; Fleetwood, D.M.; Weaver, H.T.; Pfeiffer, L.; Celler, G.K. (Sandia National Labs., Albuquerque, NM (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-34**: No. 6, 1686-1691(Dec 1987). (CONF-8707112—). Contract AC04-76DP00789.

From Annual conference on nuclear and space radiation effects; Snowmass Village, CO, USA (28 Jul 1987).

Total dose radiation effects were measured for sidewall-hardened n-channel SOI/MOS transistors, fabricated in zone-melt-recrystallized (ZMR) and oxygen-implanted (SIMOX) SOI materials. The authors compare the radiation responses of transistors with three types of sidewall or edge configurations: island transistors with passivated edges, island transistors without passivated edges, and edgeless (enclosed-gate) transistors. Data from these three test devices allow clear separation of front-, back-, and edge-channel conduction. Passivated edge channels were hard to Co-60 doses in excess of 24 Mrad(Si). The overall hardness of the passivated-edge transistors is limited only by the radiation-induced threshold voltage shifts (about -1 V at 1.0 Mrad) of the top channel. No significant differences in total-dose response of ZMR and SIMOX devices were observed under the radiation conditions employed.

36986 Picosecond studies of the nonradiative decay dynamics of triphenylmethane dyes in a diamond anvil pressure cell. Ben-Amotz, D.; Harris, C.B.; Jeanbz, R. (Exxon Research and Engineering Co., Annandale, NJ 08801 (US)). pp 106 of XV international conference on quantum electronics (Digest of technical papers). Washington, DC; Optical Society of America (1987). (CONF-870488—).

From 15. international conference on quantum electronics; Baltimore, MD, USA (27 Apr 1987).

Technical Paper WFF 2.

The nonradiative decay dynamics of crystal violet and other triphenylmethane dyes depend strongly on the nature of the solvent in which they are dissolved. The rate-limiting step of the decay is thought to be barrierless torsional diffusion of the phenyl groups in the excited electronic state. Previous studies of either the fluorescence quantum yield or the ground state bleach recovery time have found a weak nonlinear viscosity dependence. Recent studies of the excited-state absorption decay time have found a linear viscosity dependence in the eta-alcohol series of solvents at constant temperature. The results of the first pressure-dependent picosecond study of a triphenylmethane dye in short chain alcohols are reported. This study reveals a linear viscosity dependence over a viscosity range of nearly three decades. Differences between the temperature, pressure, and solvent dependence at low viscosities are discussed.

36987 Growth and characterization of GaAs/AlAs superlattice alloys. Drummond, T.J.; Jones, E.D.; Hjalmarson, H.P.; Doyle, B.L. (Sandia National Labs., Albuquerque, NM (US)). pp 2-9 of Growth of compound semiconductors. Gunshor, R.L.; Morkoc, H. Bellingham, WA; SPIE Society of Photo-Optical Instrumentation Engineers (1987). (CONF-870385—). Contract AC04-76DP00789.

From SPIE conference on growth of compound semiconductors; Bay Point, FL, USA (26 Mar 1987).

Recent studies of short period GaAsAlAs superlattices grown by molecular beam epitaxy have shown thats the superlattice bandstructure resembles that of the AlGaAs alloy system. The authors have studied indirect gap GaAsAlAs superlattice alloys using x-ray diffraction and pressure dependent magneto-luminescence. Analysis of the x-ray data shows that the AlAs layers are strained to be pseudomorphic with the GaAs substrate. Because the indirect conduction band ground state derives from the AlAs X-point these superlattice alloys must be treated as trained-layer superlattices. Interpretation of luminescence data using Kronig-Penney and tight-binding analyses of the superlattice bandstructure and optical dipole matrix elements shows that this experiment provides a sensitive measure of the conduction band offset for the GaAsAlAs system. Quantum size effects lift the three-fold degeneracy of the X-point to yield an in-plane X band quantized according to the transverse electron mass (X/sub t/) and a separate X band along the superlattice axis quantized according to the longitudinal electron mass (X/sub t/). Strain shifts at the X-points are of the same magnitude as quantum size effect shifts and drive the X/sub t/ band toward lower energies. The effect of strain in the conduction band can be accurately modeled by assuming GaP deformation potentials for the AlAs layers.

36988 Molecular dynamics simulation of beam deposition of low-energy (10-100 eV) Si atoms on the Si(111) surface. Dodson, B.W.; Taylor, P.A. (Sandia National Labs., P.O. Box 5800, Albuquerque, NM (US)). pp 130-138 of Growth of compound semiconductors. Gunshor, R.L.; Morkoc, H. Bellingham, WA; SPIE Society of Photo-Optical Instrumentation Engineers (1987). (CONF-870385—). Contract AC04-76DP00789.

From SPIE conference on growth of compound semiconductors; Bay Point, FL, USA (26 Mar 1987).

The deposition of low energy (10-100 eV) silicon atoms onto an unreconstructed (111) silicon surface has been studied using molecular dynamics techniques and an accurate empirical potential describing the covalent Si-Si bonding. 10 eV silicon atoms were directed normal and at 60° angles to a silicon (111) substrate. The resulting atomic trajectories and substrate response were studied to determine the energy loss mechanism resulting in capture and the local lattice excitation near, and subsequent diffusion of excess vibrational energy away from, the impact point. More glancing angles of incidence (5° - 30°) were studied for beam energies of 20-100 eV. In general, incident atoms are either quickly adsorbed or scatter from the surface in this energy range. However, for angles less than a critical value a new phenomenon of 'surface channeling' is observed. In 'surface channeling', the trajectory of the incoming particle is steered by short-range repulsive and long-range attractive interactions with the surface atoms parallel to, and roughly 2 A above, the surface of the substrate. Ranges of thousands of angstroms of travel along the surface can occur before the particle ultimately undergoes adsorption into a single site. These surface channeling trajectories as well as the local excitation provided by adsorption of energetic incident atoms offer considerable promise for precision control of the beam-induced growth and non-equilibrium semiconductor structures.

36989 Multiphase flow in geological materials: Dynamic loading theory and numerical modelling. Kansa, E.J.; Kirk, T.M.; Swift, R.P. (Univ. of California, Lawrence Livermore National Lab., P.O. Box 808, Livermore, CA (US)). pp 206-211 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemical Engineers (1987). (CONF-870816—). Contract W-7405-ENG-48.

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

The authors have developed a numerical scheme for integrating the time-dependent conservation equations for multifluid porous flow. One of its features is as an explicit-implicit method for integrating that constituent momentum equations which only involves a block diagonal matrix. The equations are solved in a Lagrangian frame tied to the solid particle velocity. In this frame, they are able to time-integrate the liquid and gaseous mass conservations exactly. They demonstrated the solution technique on a 2- and 3-phase porous flow shock tube simulation. The saturated case agrees well with the previous results of Garg and Sandhu. The authors successfully run the unsaturated case at both high and low permeability. The gas phase response, because of small inertia, is basically uncoupled from that of the solid and liquid. The unsaturated case also permits gas, "air", to be transported in or out of pores very readily as compared to water which has so much more inertia.

36990 Enstatite, $Mg_2Si_2O_6$: A neutron diffraction refinement of the crystal structure and a rigid-body analysis of the thermal vibration. Ghose, S.; Schomaker, V.; McMullan, R.K. (Washington Univ., Seattle (USA). Dept. of Geology; Washington Univ., Seattle (USA). Dept. of Chemistry; Brookhaven National Lab., Upton, NY (USA). Dept. of Chemistry). *Zeitschrift fuer Kristallographie, Kristallgeometrie, Kristallphysik, Kristallchemie;* 176: No. 3/4, 159-175(1986). Contract AC02-76CH00016.

Synthetic enstatite, $Mg_2Si_2O_6$, is orthorhombic, space group Pbca, with eight formula units per cell and lattice parameters a = 18.235(3), b = 8.818(1), c = 5.179(1) A at 23°C. A least-squares structure refinement based on 1790 neutron intensity data converged with an agreement factor $R(F^2) = 0.032$, yielding Mg-O and Si-O bond lengths with standard deviations of 0.0007 and 0.0008 A, respectively. The variations observed in the Si-O bond lengths within the silicate tetrahedra A and B are caused by the differences in primary coordination of the oxygen atoms and the proximity of the magnesium ions to the silicon atoms. The latter effect is most pronounced for the bridging bonds of tetrahedron. A. The smallest O-Si-O angle is the result of edge-sharing by the Mg(2) octahedron and the A tetrahedron. An analysis of rigid-body thermal vibrations of the two crystallographically independent $[SiO_4]$ tetrahedra indicates considerable librational motion, leading to a thermal correction of apparent Si-O bond lengths as large as +0.002 A at room temperature.

36991 (CONF-880543—2) Theoretical studies of chemical reactions: potential surfaces. Dunning, T.H. Jr.; Harding, L.B.; Shepard, R.; Cremer, E.; Jasien, P.G. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011984/JAW.

From Basic energy sciences combustion contractor's meeting; Lake Geneva, WI, USA (31 May 1988).

Calculations on the addition reaction of two hydroxyl radicals forming hydrogen peroxide are presented. An analytic representation of the long range surface was obtained by fitting the energies of 1000 points to a potential involving approximately 500 terms. The analytic potential covers the region of the potential surface from an O-O separation of 2.5 A out to two isolated OH radicals. This connects regions where electrostatic, hydrogen bonding and covalent bonding forces each, in turn, dominant the potential and will allow the detailed modeling of the addition reaction in a much more realistic manner than has here-to-fore been possible.

36892 (CEA-N—2541) Method of evaluating quantities of plutonium by gamma spectrometry applied to measurement of retention monitoring of wastes and surveillance of facility dismantling. Morel, J.; Chauvenet, B.; Etcheverry, M.; Monier, J.; Labernede, Y.; Louppe, L. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Lab. de Metrologie des Rayonnements Ionisants; CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection Technique). Nov 1987. 22p. (In French). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753474/JAW.

The gamma spectrometry method of measuring quantities of plutonium has now been developed in different fields of nuclear work to enable reliable balance management to be carried out, to ensure safety requirements are met and to make better discharge monitoring possible. The method is applicable to the measurement of masses ranging from a few tens of milligrammes to a number of tens of grammes, and can replace or back-up other non-destructive techniques. It is comparatively rapid, as a counting period of ten minutes is sufficient for a quantity of the order of one gramme, and requires a gamma spectrometry system previously calibrated in the 100 to 500 keV region. A number of testing sessions have been carried out in the last few months. The results of gamma spectrometry measurement broadly correspond to the calibration values or those derived by other methods: neutron counting and calorimetry.

36893 (CONF-870524—3) Interim: selected chemical research reported between conferences five and six. Jolley, R.L.; Johnson, J.D. (Oak Ridge National Lab., TN (USA); North Carolina Univ., Chapel Hill (USA)). 1987. Contract AC05-84OR21400. 29p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011840/JAW.

From 6. conference on water chlorination: environmental impact and health effects; Oak Ridge, TN, USA (3 May 1987).

In this brief literature review, the authors attempt to summarize the principals research that was published in the interval between the fifth and sixth water chlorination conferences (1984-1987) and that is not specifically presented in this volume. Any review is, of necessity, subjective. However, the review should help ensure the comprehensive nature and utility of this collective volume. This review is divided into major groupings and proceeds from that area of chemistry that is a fundamental basis for most science (i.e., analytical chemistry) and progresses to areas of human health and environmental concerns.

36894 (CONF-871038—12) Thermodynamic modeling of chemical equilibria in metal extraction. Chaiko, D.J.; Fredrickson, D.R.; Reichley-Yinger, L.; Vandegrift, G.F. (Argonne National Lab., IL (USA)). 1987. Contract W-31109-ENG-38. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009948/JAW.

From 5. symposium on separation science and technology for energy application; Knoxville, TN, USA (26 Oct 1987).

Models of equilibrium extraction data are being developed for use in computer simulations of metal extraction processes. The correlations are based on chemical mass action principles in which the effects of metal complexation and aqueous phase activity coefficients are considered. Activity coefficients in mixed electrolyte solutions at high ionic strengths are calculated using methods available in the literature. This modeling approach is demonstrated for HNO_3 extraction with both the PIREX and TRUEX solvents and for Am^{3+} extraction by octylphenyl-N,N-diisobutylcarbamoylmethylphosphine oxide, which is the primary extractant in the TRUEX solvent. 27 refs., 4 figs., 4 tabs.

36895 (CONF-880625—2) On S_2F_{10} formation in spark breakdown of SF_6. Sauers, I.; Votaw, P.C.; Griffin, G.D.; Kurka, K.; Easterly, C.E. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008088/JAW.

From Institute of Electrical and Electronics Engineers symposium on electrical insulation; Boston, MA, USA (5 Jun 1988).

Recent biological testing [1] of sparked SF_6 has yielded results that implicate the existence of S_2F_{10} in the sparked gas and suggest that S_2F_{10} may play an important role in the over-all toxicity of sparked SF_6. Additionally, experiments on heated sparked SF_6 and direct biological testing of S_2F_{10} have strengthened the above claims. We report on the gas chromatographic (GC) analyses of sparked SF_6 and the comparison with the analyses of 0.5% $S_2F_{10}SF_6$ mixtures. Under the GC conditions which were employed, a peak is observed at elution times identical (to within 0.8%) to the S_2F_{10} peak in the $S_2F_{10}SF_6$ samples. Measurements made on $SO_2SOF_2SF_6$ mixtures indicate that SO_2 elutes from the column at times extremely close to but slightly longer than (by 10%) what we believe to be the S_2F_{10} peak. Although complete confirmation of the identification of S_2F_{10} in our sparked SF_6 samples awaits further measurements by mass spectrometry of the GC effluent, our conclusion based on these analyses indicates that S_2F_{10} is formed in amounts (on the order of hundreds of ppM) consistent with concentrations necessary for producing the toxic effects which we have previously observed. 13 refs., 3 figs., 1 tab.

36896 (CONF-880768—1) Direct determination of part-per-billion levels of volatile organics in water and soil samples using glow discharge mass spectrometry. Wise, M.B.; Guerin, M.R. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 20p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011389/JAW.

From 4. annual waste testing and quality assurance symposium; Washington, DC, USA (11 Jul 1988).

A low pressure glow discharge ion source has been constructed in our laboratory and interfaced with a quadrupole mass spectrometer for the direct monitoring of trace organic vapors in air. Important features of this ion source include a simple design, low cost, low maintenance, and the ability to sample air directly without the need for membranes, splitters, or capillary restrictors. Although the flow rate of air into the source is approximately 2 standard mL per second, the pressure within the ionization region is maintained at 200 mTorr which reduces interferences caused by the formation of water cluster ions. Furthermore, the high flow rate of air into the ion source provides a simple and convenient means of purging volatile organics from water or soil samples directly into the mass spectrometer without additional apparatus or extensive sample preparation. Early studies with this system indicate that low part-per-billion levels of volatile organics such as benzene or tri-chloroethylene can be quantitatively determined in water and soil samples either by monitoring headspace above a sample or by direct purging. Analysis time of 2-5 minutes provides a high throughput of 10 or more samples per hour.

36897 (CONF-880768—2) Recommendations for holding times of environmental samples. Maskarinec, M.P.; Johnson, L.H.; Holladay, S.K. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 18p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011831/JAW.

From 4. annual waste testing and quality assurance symposium; Washington, DC, USA (11 Jul 1988).

Experiments have been conducted for the purpose of establishing acceptable minimum holding times for soil and water samples. Analytes of interest have been volatile organics, pesticides, and explosives. The pesticides and explosives represent subclasses of semivolatile organics. Several soils and several water samples have been used in this investigation. The holding times for volatile organics in water samples are dependent on the objectives of the analysis. Aromatics and some haloethanes are stable in water for limited times, approximately 14 days is the recommended maximum. However, the degradation of these compounds can be eliminated or greatly reduced by preservation with acid. Several acids are recommended, including HCl, ascorbic acid, and sodium hydrogen sulfate. For analyses where only certain volatiles are to be considered, as in the case of RCRA monitoring, individual holding times can be recommended. For many of these volatiles, holding times can be recommended as long as one year, even without preservation.

36998 (DOE/ER/13542—2) Studies of the analyte carrier interface in flow injection analysis: Project report, June 1, 1987-February 1, 1988. Brown, S.D. (Delaware Univ., Newark (USA). Dept. of Chemistry). 1988. Contract FG02-86ER13542. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010794/JAW.

The goal of this project is the study of rapid multicomponent analysis of transient species in flowing media. Application of methods developed for multicomponent analysis is aimed at the investigation of dispersion-controlled chemical reactions at an analyte bolus-carrier solution interface, and the study of the effects of competition between analyte species on the distribution of products in chemical reactions. To meet these goals, study of new methods for the analysis of three-dimensional data resulting from measurement of transient species by sensor arrays or by rapid-scan (or multiplex) detection has commenced. Research has concentrated on three areas during the past year. These areas are (1) flow reaction analysis, (2) modeling of complex reaction kinetics, and (3) new methods for multicomponent analysis of inadequately modeled systems. Progress in each area is evaluated. 3 figs.

36999 (DOE/ER/13591—2) Dual mechanism bifunctional polymers: Design, synthesis and application of a new category of metal ion complexing agents: Progress report, August 1, 1987-July 31, 1988. Alexandratos, S.D. (Tennessee Univ., Knoxville (USA)). Apr 1988. Contract FG05-86ER13591. 10p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88008233/JAW.

Ionic recognition between a polymer and an ion can yield a highly specific separation agent for the recovery of target ions in dilute solutions. Reactive polymers named dual mechanism bifunctional polymers consist of polymers which interact with ions via two different mechanisms through two different groups. Research during the current period has focused on metal ion studies with the Class II phosphonic acid/phosphonate ester resins, the development of a new Class II resin involving pseudocrown ether moieties, and introduction of the Class III ion exchange/precipitation resins. 9 refs. 37000 (GKSS—87/E/39) Total-reflection X-ray fluorescence analysis. Prange, A. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.); GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.). Inst. fuer Physik). 1987. 12p. (In German). Special print from G-I-T (Glas- Instrum.-Tech.) Fachz. Lab. (1987) v. 31 p. 513-526.

Total-reflection X-ray-fluorescence (TXRF) is a new method for the determination of trace elements. It is a special variant of the energy-dispersive X-ray fluorescence analysis (XRF). Contrary to conventional energy-dispersive XRF instruments, in TXRF the exciting X-ray beam impinges upon an optically flat sample support made of quartz glass at angles of incidence below the critical angle of total reflection. The specimen is prepared as a thin film. The detection power of the TXRF method is by 2 to 3 orders of magnitude better than that of conventional XRF which allows multielement determination down to the ultra trace-concentration level. The possibility of internal standardization on the basis of an inherent universal calibration curve, the simple specimen preparation and the minute sample masses required make TXRF also useful for routine investigations. Based on the principles of X-ray-fluorescence the TXRF method and its characteristics are described. Examples of application of aqueous and solid samples from the environment are given demonstrating the capability of TXRF.

37001 (GKSS—87/E/43) Nuclear data for elemental analysis of geological samples with 14 MeV neutrons. Pepelnik, R. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.); GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.). Inst. fuer Physik). 1987. 5p. Special print from Nucl. Geophys. (1987) Vol. 1(3) p. 249-252.

Neutron activation analysis (NAA) with 14 MeV neutrons is an important tool for determining the main components in geological material. To increase the accuracy of the analysis, many reactions induced by 14 MeV neutrons have been investigated. Activation cross-sections, which are necessary for elemental analysis of geological samples, have been measured. As an example the 14 MeV NAA of sediment samples is described.

37002 (GKSS—87/E/47) Determination of trace elements in the water cycle by total-reflection X-ray fluorescence spectrometry. Prange, A.; Knoth, J.; Stoessel, R.P.; Boeddeker, H.; Kramer, K. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.); GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.). Inst. fuer Physik). 1987. 14p. Special print from Anal. Chim. Acta (1987) v. 195 p. 275-287.

The determination of trace elements in the various stages of the water cycle is very important. Economic procedures for multielement determinations of trace elements in various matrices are needed. The applications of total-reflection X-ray fluorescence spectrometry in this general area are reviewed briefly, with examples relating to rain, river and sea waters, sediments, particulate matter and manganese nodules and crusts, as well as mussel tissue. Up to 25 elements can be determined; these are S, K, Ca, Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, As, Pb, Se, Rb, Sr, Y, Zr, Mo, Ag, Cd, Sb and Ba. Preliminary treatments of the various matrices are described. Accuracy checks by analysis of reference standards and by application of independent techniques are reported.

37003 (GKSS—87/E/48) Element patterns in healthy and diseased Norway spruce (Picea abies) measured by inductively-coupled plasma/atomic emission spectrometry and total-reflection X-ray fluorescence spectrometry. Berneike, W.; Ehlers, W.; Knoth, J.; Rademacher, P. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.); GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.). Inst. fuer Physik). 1987. 10p. Special print from Anal. Chim. Acta (1987) v. 195 p. 289-297.

Nutritive and toxic elements in growth rings of stem wood and in phloem, needles, and fine roots were determined by using inductively-coupled plasma/atomic emission spectrometry and total-reflection X-ray flourescence spectrometry. Along with the tree tissues, soil solutions were also analyzed. Trees were selected from different West German sites with wide variations in the degree of damage. Concentrations are presented for Ca, Mg, K, Fe, Mn, Al, Na, Sr, Ba, P, S, Si, Zn, Cu, Cd and Pb. The results are discussed in terms of correlations between concentrations of elements and status of disease.

37004 (GSCan-P—85-1B, pp 423-429) Radiocarbon dating with accelerator mass spectrometry. Results from Ellesmere Island, District of Franklin. Blake, W. Jr. (Geological Survey of Canada, Ottawa, Ontario). 1985. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88780080/JAW.

In Current research.

Radiocarbon dating by means of accelerator mass spectrometry (AMS) has two great advantages over conventional dating: 1) much smaller samples can be handled and 2) counting time is significantly shorter. Three examples are given for Holocene-age material from east-central Ellesmere Island. The results demonstrate the potential use of this technique as a powerful research tool in studies of Quaternary chronology. Individual fragments of marine shells as small as 0.1 g have been dated successfully at the IsoTrace Laboratory, University of Toronto. In the case of an aquatic moss from a lake sediment core, an increment 0.5 cm thick could be used instead of a 5 cm-thick slice, thus allowing a much more precise estimate of the onset of organic sedimentation.

37005 (INIS-BR—1073) Application of X-ray technique to characterization of fluorite sample. Cancado, R.Z.L.; Luz Ferreira, O. da. (Minas Gerais Univ., Belo Horizonte (Brazil). Escola de Engenharia). 1986. 10p. (In Portuguese). (CONF-8611238—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702771/JAW.

From 41. annual congress of the Brazilian Association of Metals; Sao Paulo, Brazil (9 Nov 1986).

This investigation had the purpose of characterizing fluorite veins of "Mineracao Sartor", in Itaborai region/RJ, which is an excelent geographic position in relation to the consuming market. These studies have in view to give subsidy to future works to the best fluorite utilization. They realized tests with X-rays diffractometer and spectrometer, polarizing microscope and with a mounting of electric circuit to measure the type of semiconductivity. (C.M.C.T.R.).

37006 **(INIS-BR—1074) Reduction chlorination of slag containing niobium, tantalum and titanium.** Moura, F.J.; Brocchi, E.A. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Ciencia dos Materiais e Metalurgia). 1986. 17p. (In Portuguese). (CONF-8611238—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702772/JAW.

From 41. annual congress of the Brazilian Association of Metals; Sao Paulo, Brazil (9 Nov 1986).

Reduction chlorination experiments were carried out with slag containing niobium, tantalum in order to evaluate the effects of some variables on the behaviour of the material. Kinetic curves were obtained with the main variables being temperature and percentage of reducing agent. The reaults showed a greater effect of temperature as well as indicated the formation of the non-volatile chlorides ($CaCl_2$) as a factor reducing the reaction rate. Quantitative analyses of the material collected in the condenser indicated the viability of the method to recover the valuable metals.

37007 **(INIS-BR—1092) Rb/Sr and K/Ar determinations of Monguba and Pendanga rocks,Ceara.** Torquato, J.R.F.; Pedreira, L.H.; Kawashita, K.; Barbosa, H.S.P. (Ceara Univ., Fortaleza (Brazil). Dept. de Geologia). 1986. 14p. (In Portuguese). (CONF-8610278—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702789/JAW.

From 34. Brazilian congress of geology; Goiania, Brazil (12 Oct 1986).

In this paper we describe the petrography and geochronology of rocks from two quarries near the City of Fortaleza/Ceara. One, the Pedreira Monguba, is formed, basically, by rocks of the granitic to monzogranitic type. Its isochrone age is 672 +- 46 m.y. with an initial ratio of 0.7036 +- 0.0005. Datinfs of biotite by the K/Ar method gave values of 522+- 19m.y. for the consolidation of the region. For comparison with the other components of the same morphologic unit, the Massif of Maranguape, we designed a reference isochrone with all values available from the literature (for granite, gneisses and migmatites) and obtained a straight line parallel to the first, but with a higher initial ratio of 0.709, demonstrating the strong influence of the Brasiliano Cycle in this region. The other quarry, Pedreira Pendanga, is composed of gneisses and migmatized gneisses and forms an open chemical system. It was possible, however, to verify that its age is equal or greater than 2150+- 71 m.y. and that all of its rocks have suffered strong metamorphism during the Brasiliano Cycle as in shown by the K/Ar ages of biotites of 541+- 3 m.y. A discussion of sampling problems is given and the influence of a granitic intrusion on the chemical opening of the system is evidenced.

37008 **(INIS-BR—1101) Qualitative mineralogical characterization of the sinter by X-ray diffraction.** Greca, M.C.; Pietroluongo, L.R.V.; Baliza, S.V.; Costa Pereira, E.A. da. (Instituto Nacional de Tecnologia, Rio de Janeiro (Brazil)). 1987. 17p. (In Portuguese). (CONF-8710277—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702797/JAW.

From 42. annual congress of the Brazilian Association of Metals; Salvador, Brazil (18 Oct 1987).

This paper aims the qualitative mineralogical characterization of sinters and raw materials employed on its fabrication, via X-ray diffraction technique. Thus, sample with constant coke breeze content and variable contents of sand, limestone, dunite and dolomite were prepared to obtain current sinter compositions, with variable basicity. The tests were performed at the research of the following institutions: Companhia Siderurgica Nacional, Centro de Tecnologia Mineral and Instituto Nacional de Tecnologia.

37009 **(INIS-BR—1104) Alkaline intrusion of Pariquera - Acu: implication for South - Atlantic Evolution.** Ferreira, F.J.F.; Martins, F.A.G.; Monma, R.; Silva, R.B.; Rodrigues, E.P.; Coutinho, J.V.M.; Algarte, J.P.; Theodorovicz, A.; Tassinari, C.C.G. (Instituto de Pesquisas Tecnologicas, Sao Paulo (Brazil)). 1987. 1p. (CONF-8707165—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702870/JAW.

37011 (INIS-mf—11126, pp 108-109) **RNAA determination of As, Cd and Zn in biological materials.** Taskaev, E.; Penev, I.; Kinova, L. (Bylgarska Akademiya na Naukite, Sofia. Inst. za Yadrena Izsledvaniya i Yadrena Energetika). May 1985. NTIS (US Sales Only), PC A09/MF A01. Order Number DE88780068/JAW. (CONF-8505353—).

From 1. Balkan conference on activation analysis; Varna, Bulgaria (6 May 1985).

In connection with the IAEA project 3739RB the elements Hg, As, Cd and Zn in human spleen, kidney, heart, liver, SRM Bovine Liver 1577a and Bowen's Kale. The consecutive extraction have been chosen as the most rational approach determining these elements in a single specimen. Aiming at getting reliable results well established systems were used (ditizone to separate Hg, Cu and DEDTC to extract As, Cd and Zn). Special attention was paid to the accuracy of the determination. Monitoring, optimization and cooling time and control of chemical yield were carried out in each case. The samples were irradiated in the vertical channel of the IRT-2000 reactor in Sofia, in thermal neutron flux of about $5.10^{13}n.cm^{-2}.s^{-1}$ for 24 h. Iron monitor was used and cooling time varied from 20 h to 30 h.

37012 (INIS-mf—11126, pp 149-151) **Neutron activation analysis of some zircon samples from the Apuseni mountains (Romania).** Salagean, M.; Pantelica, A.; Znamirovschi, V.; Motiu, A. (Institutul de Fizica si Inginerie Nucleara, Bucharest (Romania)). May 1985. NTIS (US Sales Only), PC A09/MF A01. Order Number DE88780068/JAW. (CONF-8505353—).

From 1. Balkan conference on activation analysis; Varna, Bulgaria (6 May 1985).

The concentrations of 23 elements in a zircon sample were determined using instrumental neutron activation analysis. The sample and the SL-1 and Soil-5 standards were irradiated for 50 hours in a thermal neutron flux of 1.1 x $10^{11}ncm^2.s$ in order to measure the long lived isotopes. For Zr measurements a ZrO_2 standard was used. The measurements were carried out by a Ge(Li) detector with 2 KeV resolution, after 8 to 30 days cooling time. To determine the short lived isotopes as Au, Dy, Mn, Ti and V, the sample was irradiated in a 2 x $10^{12}ncm^22.s$ flux for 1 min, using a W-1 standard. The results for major and trace element quantity ratios in zircon prove to be very interesting for geochemists and petrologists.

37013 **(INIS-mf—11227) 2nd conference on rare earths.** (Ceskoslovenska Vedeckotechnicka Spolecnost, Usti nad Labem. Dum Techniky). 15 May 1987. 92p. (In Czech and Slovak). (CONF-8704300—). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702876/JAW.

From 2. conference on rare earths; Mikulov, Czechoslovakia (28 Apr 1987).

The conference heard a total of 16 papers of which 8 were incorporated in INIS, namely those dealing with the separation of rare earths from mineral raw materials (Kola apatite, bastnaesite ore), the best methods of preparing rare earth compounds for the

production of polishing powders, and design of an experimental mixer-settler. (E.S.).

37014 (INIS-mf—11227, pp 20-23) **Technology of production of high-level concentrate of rare earths from Kola apatite.** Bejrova, V. (Chemopetrol, Lovosice (Czechoslovakia)). 15 May 1987. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702876/JAW. (CONF-8704300—).

From 2. conference on rare earths; Mikulov, Czechoslovakia (28 Apr 1987).

The procedure is described of separating rare earth elements from the Kola apatite which contains 0.7 to 1.0% oxides of rare earths. The separation takes place during the manufacture of combined fertilizer NPK-1. During the manufacture of the fertilizer the solution is neutralized with the precipitation of phosphates of rare earths. Increasing pH is accompanied by increased yield of the sum of rare earths. The yield is higher for lighter lanthanoids than for heavier lanthanoids. The phosphate concentrate is decomposed by nitric acid and rare earth elements are precipitated by oxalic acid. Following the annealing of the oxalate concentrate the obtained oxide concentrate will contain 92 to 95% oxides of rare earths. (E.S.).

37015 (INIS-mf—11227, pp 24-27) **Concept of separation technology for rare earth elements.** Slepicka, J. (Ustav Nerostnych Surovin, Kutna Hora (Czechoslovakia)). 15 May 1987. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702876/JAW. (CONF-8704300—).

From 2. conference on rare earths; Mikulov, Czechoslovakia (28 Apr 1987).

The initial raw material for the designed separation of rare earth elements were flotation concetrates of bastnaesite ore from the Vietnamese Socialist Republic or phosphate concentrates produced during the manufacture of NPK fertilizer from the Kola apatite. A unified hydrometallurgical method shown in the figure was suggested for the reprocessing of the said concentrates. Liquid concentrate with a low content of Ce, without Th and with minimum content of fluorides enters the extraction separation: Di-2-ethylhexylphosphoric acid is used as the extraction agent. (E.S.). 1 fig.

37016 (INIS-mf—11227, pp 28-30) **Efficiency of selected separation techniques in rare earth element determination.** Weiss, B.; Sulcek, Z. (Ustredni Ustav Geologicky, Prague (Czechoslovakia)). 15 May 1987. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702876/JAW. (CONF-8704300—).

From 2. conference on rare earths; Mikulov, Czechoslovakia (28 Apr 1987).

Briefly evaluated are various separation methods (instrumental, extraction, ion exchange chromatography, liquid chromatography) both for the group separation of trace elements and for the separation of individual elements. (E.S.).

37017 (INIS-mf—11227, pp 60-64) **Treatment of bastnaesite ore from Vietnamese Socialist Republic.** Formanek, J.; Jerabek, J.; Jancarek, J. (Ustav Nerostnych Surovin, Kutna Hora (Czechoslovakia); Ustav pro Vyzkum Rud, Mnisek pod Brdy (Czechoslovakia)). 15 May 1987. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702876/JAW. (CONF-8704300—).

From 2. conference on rare earths; Mikulov, Czechoslovakia (28 Apr 1987).

From the Vietnamese deposit at Nam Nam Xe Czechoslovakia imported several hundred tons of ore. Several methods of ore dressing were used: gravitational, preconcentration in electromagnetic field, magnetic separation, high-intesity electromagnetic separation. Flotation evidently was the best dressing method tried. The results are presented of testing using different flotation agents. (E.S.).

37018 (INIS-mf—11227, pp 65-74) **Mixer-settler for extraction separation of rare earth elements.** Rozkos, B.; Haman, J. (Vyzkumny Ustav Chemickych Zarizeni, Prague (Czechoslovakia)). 15 May 1987. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702876/JAW. (CONF-8704300—).

From 2. conference on rare earths; Mikulov, Czechoslovakia (28 Apr 1987).

A four-stage extractor is designed for research in the size of a 10 l mixer. The basic characteristics of the design are given. The test extractor will be made of ATLAC 580-05 resin laminate and will be subject to performance tests. (E.S.). 2 figs., 18 refs.

37019 (INIS-mf—11227, pp 82-85) **Selection of solvent for di-2-ethylhexylphosphoric acid for extraction separation of rare earth elements.** Zvolanek, S. (Ustav Nerostnych Surovin, Kutna Hora (Czechoslovakia)). 15 May 1987. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702876/JAW. (CONF-8704300—).

From 2. conference on rare earths; Mikulov, Czechoslovakia (28 Apr 1987).

The separation of La, Gd and Y was made. The extraction constants of these elements and the average values of selective coefficients S(GdLa) and S(YGd) were determined for solvents: kerosene PS 1, aircraft kerosene PL-5, Nivol 2, NDF 2, isooctane, Escaid 100, Escaid 120 and toluene. Di-2-ethylhexylphosphoric acid concentration ranged between 0.97 and 0.99 moldm^3. It was found that the solvent NIVOL 2 of Czechoslovak make may be used for the extraction of rare earths but that values of extraction constants are ca 20% lower. (E.S.). 2 tabs., 6 refs.

37020 (INIS-mf—11227, pp 86-89) **Thorium elution from nitrate bastnaesite leachates with ion exchangers.** Marhol, M. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). 15 May 1987. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702876/JAW. (CONF-8704300—).

From 2. conference on rare earths; Mikulov, Czechoslovakia (28 Apr 1987).

Anion exchanger Wofatit SBW was used for selective sorption of Th from leaching solutions in the processing of bastnaesite ore. Chemical conditions of sorption were identified, and effects were studied on the rate of exchange in static and dynamic conditions. Experiments with actual samples were made. (E.S.). 1 tab.

37021 (JINR—18-87-406) **Multielement γ activation analysis of coal.** Sodnom, N.; Gehrbish, Sh.; Zhuchko, V.E.; Maslov, O.D.; Fiderkevich, A.; Khristov, Kh. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1987. 11p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702129/JAW.

Submitted to the journal Khim. Tverd. Topl. .

A method of multielemental instrumental gamma activation analysis (IGAA) of coal using microtron bremsstrahlung is proposed. Activities of irradiated samples were measured by means of Ge(Li)- and HPGe-detectors. Quantitative determination of elements has been made using standard reference materials. This method allows one to determine concentrations of 36 elements in coal with detection limits down to 1 x 10^{-7} gg. The results of IGAA in coal from some mines of Mongolia and Poland are presented. 10 refs.; 5 figs.; 4 tabs.

37022 (LA—11297-MS) **Use of multivariate calibration for plutonium quantitation by the Pu(III) spectrophotometric method.** Wangen, L.E.; Phillips, M.V.; Walker, L.F. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010489/JAW.

Two new multivariate calibration methods for using all of the relevant spectral information are applied to the determination of plutonium. The analyte response signal originates from the absorbance spectrum of Pu(III)from 500 to 900 nm. Partial least squares (PLS) regression gives an average absolute error of 0.114 {+-} 0.108 mg when predicting plutonium content of standards containing 65 to 90 mg total plutonium. PLS uses all of the signal in the spectrum and is a more robust calibration procedure than a method based on absorbances at five wavelengths. Another calibration procedure involving least squares curve fitting (LSCF) fits either the entire spectrum or individual spectral intervals derived from standards to spectra of unknowns. In addition, an arbitrary linear base line can be included. The best LSCF option for the same calibration and test set as used for PLS was the full spectrum (522 to 900

nm) with a linear base-line option. The average absolute error when predicting with LSCF was 0.130 {+-} 0.092 mg plutonium. LSCF has an advantage over PLS in that the linear base line can account for certain types of interferences that have been observed for this plutonium assay procedure. An example is given. 6 refs., 3 figs., 5 tabs.

37023 **(LA—11298) Determining cerium in plutonium by anion exchange and x-ray fluorescence.** Martell, C.J.; Hansel, J.M. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 6p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010490/JAW.

This report describes a procedure for determining cerium in plutonium using an anion-exchange separation and x-ray fluorescence. We add lanthanum to the plutonium solution as an internal standard, oxidize the plutonium to Pu/sup {plus/4}, and pass the solution through an anion-exchange column with 8M HCl. The Pu/sup {plus/4} sorbs to the resin, and the cerium and lanthanum pass through the column completely. We evaporate the solution containing the cerium and the lanthanum to 0.5 mL for pipetting onto a resin paper disc. The Pu/sup {plus/4} is eluted off the column using 0.1M HCl. We then measure the K/sub α/ x-ray line for both cerium and lanthanum. The ratio of cerium to lanthanum for the sample is then compared with those from the standards. This method has a precision of 2.8% relative standard deviation for cerium over a concentration range of 0.1 to 5% cerium. 2 refs., 2 figs., 3 tabs.

37024 **(LA-UR—88-1249) Resonance ionization mass spectrometry of lead and bismuth mixtures.** Fearey, B.L.; Miller, C.M.; Anderson, J.E.; Nogar, N.S.; Rowe, M.W. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 5p. (CONF-880435—14). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88009131/JAW.

From 4. international symposium on resonance ionization spectroscopy and its applications; Gaithersburg, MD, USA (10 Apr 1988).

Resonance ionization of lead and bismuth has been demonstrated using an excimer laser pumped dye laser in three-photon, one-color ionization schemes, using a quadrupole mass spectrometer for detection.

37025 **(LA-UR—88-1281) Laser desorption/ablation studies by resonance ionization mass spectrometry.** Nogar, N.S.; Estler, R.C.; Rowe, M.W.; Fearey, B.L.; Miller, C.M. (Los Alamos National Lab., NM (USA); Fort Lewis Coll., Durango, CO (USA). Dept. of Chemistry; Texas A and M Univ., College Station (USA). Dept. of Chemistry). 1988. Contract W-7405-ENG-36. 5p. (CONF-880435—12). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009124/JAW.

From 4. international symposium on resonance ionization spectroscopy and its applications; Gaithersburg, MD, USA (10 Apr 1988).

Theory and results are presented for RIMS diagnostics of a variety of laser-materials interactions. 5 refs. 3 figs.

37026 **(NEI-NO—41) Determination of trace elements in seawater using Mg-scavenger as preconcentration agent, and neutron activation analysis.** Andersen, B. (Oslo Univ. (Norway)). 1986. 147p. (In Norwegian). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88752493/JAW.

In order to determine trace elements in seawater, a preconsentration method based on coprecipitation on Mg(OH) 2 is presented. Different parameters influencing the carrying effects have been investigated using model solutions and radioactive tracers. The deposit and solution are separated by filtration. Filter with deposit is stored in quarts ampules for later determination of trace elements by means of neutron activation analysis. 63 refs.

37027 **(ORNL—6474) Analytical Chemistry Division annual progress report: For period ending December 31, 1987.** (Oak Ridge National Lab., TN (USA)). May 1988. Contract AC05-84OR21400. 140p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88010762/JAW.

This report is divided into analytical spectroscopy; radioactive materials analysis; inorganic chemistry; organic chemistry; ORNL environmental programs; quality assurance, safety, and training; supplementary activities; and presentation of research results.

37028 **(PCCF-T—87-09) Study of arsenic diffusion in dental therapy by nuclear methods.** Khalis, M. (Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire). Jul 1987. 101p. (In French). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88753976/JAW.

Activation by fast neutrons (14 MeV) allows the evaluation of radioactive arsenic distribution in the different parts of teeth of which the nerve was killed. As an average 60 % of the arsenic is found in the upper part 4.3 % in the middle part and 2.2 % in the apical part. About 34 % of arsenious anhydride is diffused into the organism. This quantitative analysis is a contribution to the therapeutic choice in function of element diffusion.

37029 **(PINSTECH/NMD—118) Computerization of the iteration procedure for calculating the number of stages in counter-current solvent extraction system.** Shahid, K.A.; Sadiq, A. (Pakistan Inst. of Nuclear Science and Technology, Islamabad. Nuclear Materials Div.). Aug 1986. 31p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702480/JAW.

Solvent extraction of metals is a powerful technique for the purification and separation of various metals. This report gives some of the applications of solvent extraction for separation of metals on an industrial scale, and gives the solvents and other chemicals added for promoting extraction or separation. The power of the technique arises from the fact that the process can lend itself to multisage operation without increased consumption of heat or chemicals. In a design for a solvent extraction system, the size of the plant is determined by the number of stages required for desired extraction or separation. The present paper concerns with the development of a computer programme for these calculations. (orig./A.B).

37030 **(PNL—5109-103) Characterization of spent fuel approved testing material: ATM-103.** Guenther, R.J.; Blahnik, D.E.; Campbell, T.K.; Jenquin, U.P.; Mendel, J.E.; Thomas, L.E.; Thornhill, C.K. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. Contract AC06-76RL01830. 267p. NTIS, PC A12/MF A01;1; GPO Dep. Order Number DE88011767/JAW.

The characterization data obtained to date are described for Approved Testing Material (ATM)-103, which is spent fuel from Assembly D101 of pressurized-water reactor Calvert Cliffs, No. 1. This report is one in a series being written by the Materials Characterization Center (MCC) at Pacific Northwest Laboratory (PNL) on spent fuel ATMs. The ATMs are receiving extensive examinations to provide a source of well-characterized spent fuel for testing in the US nuclear waste repository program. ATM-103 consists of 176 full-length irradiated fuel rods with rod-average burnups of about 2600 GJ/kgM (30 MWd/kgM) and less than 1% fission gas release. Characterization data include 1) as-fabricated fuel design, irradiation history, and subsequent storage and handling; 2) isotopic gamma scans; 3) fission gas analyses; 4) ceramography of the fuel and metallography of the cladding; 5) special fuels studies involving analytical transmission electron microscopy (AEM); 6) calculated nuclide inventories and radioactivities in the fuel and cladding; and 7) radiochemical analyses of the fuel and cladding. Additional analyses of the fuel are being conducted and will be included in planned revisions of this report. 10 refs., 103 figs., 63 tabs.

37031 **(PNL-SA—15318) Plutonium, uranium, nitrate measurements in PUREX process stream by remote fiber optic diode array spectrophotometry.** Baldwin, D.L.; Stromatt, R.W. (Pacific Northwest Lab., Richland, WA (USA)). Mar 1988. Contract AC06-76RL01830. 17p. (CONF-8710146—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009486/JAW.

From Plutonium/uranium recovery operations conference; Richland, WA, USA (12 Oct 1987).

There is increasing interest in the development of real-time or near real-time spectrophotometric measurement of Pu(III), Pu(IV), Pu(VI), uranium, and nitrate in nitric acid in a process stream. A broad foundation for this measurement technique has been built at Savannah River Laboratory for the Savannah River Plant. A project is underway at Pacific Northwest Laboratory to develop the technology for PUREX plant process chemistry. The first application is the Plutonium Stripper Feed, where Pu(IV) concentrations of 10 to 50 g/L are expected, with Pu(III) and Pu(VI) being up to one tenth of that level. Nitrate concentrations of 1 to 3 {und}M are expected. This is the major difference between this application at PUREX and the work progressing at SRL, in which Pu concentrations are considerably less and nitrate levels of are considerably higher. This paper discusses the progress of our work, explains the hardware involved, discusses the use of the chemometric regression method, Partial Least Squares, and discusses the results obtained to date.

37032 **(PNL-SA—15378) Trace isotopic analysis by double-resonance ionization with cw [continuous-wave] lasers and graphite furnace atomization.** Bushaw, B.A.; Gerke, G.K. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. Contract AC06-76RL01830. 5p. (CONF-880435—19). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009490/JAW.

From 4. international symposium on resonance ionization spectroscopy and its applications; Gaithersburg, MD, USA (10 Apr 1988).

Two high-resolution, single-frequency dye lasers and a cw CO_2 laser have been used to saturate photoionization of atoms generated by a graphite furnace. Isotopic selectivities of greater than 10^8 have been observed in the double-resonance excitation to Rydberg states, and coupling laser selectivity with a quadropole mass spectrometer yields isotopic abundance sensitivities in excess of 10^{10}. Instrumental detection limits of {approximately}10/sup {minus/17} grams have been demonstrated. 2 refs., 4 figs.

37033 **(PNL-SA—15415) Low-level radionuclide analysis using resonantly enhanced collisional ionization.** Gerke, G.K.; Bushaw, B.A.; Whitaker, T.J. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. Contract AC06-76RL01830. 5p. (CONF-880435—16). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88009473/JAW.

From 4. international symposium on resonance ionization spectroscopy and its applications; Gaithersburg, MD, USA (10 Apr 1988).

Laser excitation produces highly excited atoms which are efficiently ionized by collisions with an inert buffer gas. This effect, resonantly enhanced collisional ionization (RECI), is being developed as a means of measuring radionuclides of interest to internal dosimetry; specifically, uranium and transuranic species. Initial proof-of-principle experiments have given femtogram detection limits for calcium. Recently, RECI signals have been observed from uranium and detection limits in the same range are anticipated. For the transuranics, where isotope shifts are large, modest laser bandwidths of {approximately}0.1 cm/sup {minus/1} can provide isotopic selectivity in the excitation process. 4 refs., 2 figs.

37034 **(UCRL—97403) Infrared analysis of liquid and solid D-T.** Souers, P. C.; Fearon, E. M.; Stump, R. K.; Tsugawa, R. T. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 14p. (CONF-880505—20). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88011336/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

The composition of a liquid or solid deuterium-tritium mixture may be measured by collision-induced infrared spectroscopy. For T_2, DT and D_2, respectively, we measure the areas under the absorption peaks in the regions 76.75-80.19, 85.29-88.74 and 92.79-96.23 THz (2560-2675, 2845-2960 and 3095-3210 cm/sup {minus/1}). These areas are multiplied, respectively, by these isotopic sensitivities derived from quantum calculations: 1.000, 0.891 and 0.811. The resulting numbers are proportional to the molar composition. Nearly equimolar D-T samples show good agreement between mass and infrared spectroscopy. The large DT peak in enriched molecular DT overemphasizes D_2 in the infrared analysis, but these results may be corrected with the room temperature, mass spectroscopic D-to-T ratio.

37035 **(UCRL—97403-Rev.1) Infrared analysis of liquid and solid D-T.** Souers, P.C.; Fearon, E.M.; Stump, R.K.; Tsugawa, R.T. (Lawrence Livermore National Lab., CA (USA)). May 1988. Contract W-7405-ENG-48. 5p. (CONF-880505—20-Rev.1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88011722/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

Collision-induced infrared spectroscopy may be used to measure the composition of a liquid or solid deuterium-tritium (D-T) mixture. For T_2, DT and D_2, respectively, we measure the areas under the absorption peaks in the regions 76.75 to 80.19, 85.29 to 88.74, and 92.79 to 96.23 THz (2560-2675, 2845-2960, and 3095-3210 cm/sup {minus/1}). These areas are multiplied, respectively, by these isotopic sensitivities derived from quantum calculations: 1.000, 0.891, and 0.811. The resulting numbers are proportional to the molar composition. Nearly equimolar D-T samples show good agreement between mass and infrared spectroscopy. The large DT peak in enriched molecular DT overemphasizes D_2 in the infrared analysis, but these results may be corrected with the room-temperature, mass-spectroscopic D-to-T ratio. 7 refs., 2 figs., 2 tabs.

37036 **Flame temperature measurements using the anomalous fluorescence of pyrene.** Peterson, D.L.; Lytle, F.E.; Laurendeau, N.M. (Marion Laboratories, Inc., Kansas City, Missouri 64134). *Applied Optics;* 27: No. 13, 2768-2775(1 Jul 1988).

We have evaluated the anomalous of pyrene as a method for determining flame temperature. Vapor-phase pyrene was injected into four premixed hydrogen/oxygen flames at equivalence ratios of 1.0 and 1.5 and pressures of 22 and 72 Torr. For each flame, the relative laser-induced $(S_2 \rightarrow S_0)/(S_1 \rightarrow S_0)$ emission was monitored as a function of height above the burner and compared to the temperature profile as measured by miniature thermocouples. The thermal behavior of pyrene is discussed in terms of a modified intermediate strong-coupling model. A theoretical calculation of the temperature dependence of the S_2/S_1 emission ratio agrees well with the experimental flame-temperature data. Based on this agreement, conditions are delineated for the most suitable use of pyrene as a molecular temperature probe.

37037 **Serendipity, technology, and challenges in chemical instrumentation.** Yeung, E.S. (Iowa State Univ., Ames (USA)). *Analytical Chemistry;* 60: No. 7, 441A-449A(1 Apr 1988). Contract W-7405-ENG-82.

Serendipity, technology, and challenges in chemical instrumentation each play a vital role in the development of science. Edward S. Yeung of Iowa State University speaks from personal experience about the factors that guide research.

37038 **Gradient elution for micellar electrokinetic capillary chromatography.** Balchunas, A.T.; Sepaniak, M.J. (Univ. of Tennessee, Knoxville (USA)). *Analytical Chemistry;* 60: No. 7, 617-621(1 Apr 1988). Contract FG05-86ER13613.

A method for performing gradient elution in micellar electrokinetic capillary chromatography is developed. The influence of temperature and mobile phase organic solvent concentration on capacity factors is presented and attributed to changes in phase ratio and solute distribution coefficient. Solvent programming is more effective than temperature programming at adjusting retention due to its greater influence on distribution coefficient. As anticipated, phase ratio changes could not be exploited due to concomitant losses in column efficiency. A stepwise solvent gradient involving increasing concentrations of 2-propanol and Triton-X-100 is used for the separation of a test mixture of derivatized amines.

37039 **Separation and identification of polycyclic aromatic hydrocarbon isomers of molecular weight 302 in complex mixtures.** Wise, S.A.; Benner, B.A.; Liu, H.; Byrd, G.D.; Colmsjoe, A. (National Bureau of Standards, Gaithersburg, MD (USA)). *Analytical Chemistry;* 60: No. 7, 630-637(1 Apr 1988). Contract AI05-86ER60428.

The determination of dibenzopyrenes and dibenzofluoranthenes (isomers of molecular weight 302) in complex mixtures has received relatively little attention for several reasons including low concentrations in environmental samples, the number of possible isomers, and the lack of reference compounds for comparison. In this paper they describe the separation and identification of isomers of molecular weight 302 in a coal tar extract. The compounds were isolated from the extract by normal-phase liquid chromatography (LC). Thirteen isomers were identified by using a combination of reversed-phase LC, gas chromatography, gas chromatography/mass spectrometry, and low-temperature (Shpol'skii) fluorescence spectroscopy.

37040 **Indirect fluorometric detection of anions in thin-layer chromatography.** Ma, Y.; Yeung, E.S. (Ames Lab., IA (USA)). *Analytical Chemistry;* 60: No. 7, 722-724(1 Apr 1988). Contract W-7405-ENG-82.

Thin-layer chromatography (TLC) is a broadly applicable separation technique. There is a technique for TLC quantitation known as fluorescence quenching. In fact, commercial TLC plates are available with a fluorophor already incorporated for this purpose. It is really a misnomer because rarely does the analyte actually change the fluorescence quantum yield of the fluorophor. In reality that is only a modified absorption technique. The analyte absorbs the excitation light (or the emitted light), and depletes the amount of fluorescence. The advantage is the elimination of UV optics in the observation of emission, so that direct visualization is possible for UV chromophors. Sensitivity is at best comparable to UV transmission or UV reflectance spectrometry. In this article, they describe the detection of nonfluorescing and nonabsorbing anions. Displacement of a fluorescing (background) eluting ion by the analyte ion due to electroneutrality gives rise to the response.

37041 **Electronic energy levels of small polyatomic transient molecules.** Jacox, M.E. (Theoretical Astrophysics 130-33, California Institute of Technology, Pasadena, California 91125). *Journal of Physical and Chemical Reference Data;* 17: No. 2, 269-511(Apr 1988).

The experimentally determined eletronic energy levels of approximately 500 neutral and ionic transient molecules possessing from 3 to 6 atoms are tabulated together with the associated vibrational structure, the radiative lifetime, the principal rotational constants, and references to the pertinent literature. Vibrational and molecular beams, and in rare-gas and nitrogen matrices are included. The types of measurement surveyed include conventional and laser- based absorption and emission techniques, laser absorption with mass analysis, and ultraviolet photoelectron spectroscopy.

37042 **Laser desorption and ionization of solid polycyclic aromatic hydrocarbons in air with analysis by ion mobility spectrometry.** Eiceman, G.A.; Anderson, G.K.; Danen, W.C.; Ferris, M.J.; Tiee, J.J. (New Mexico State Univ., Las Cruces (USA)). *Analytical Letters;* 21: No. 4, 539-552(Apr 1988).

Solid polycyclic aromatic hydrocarbons with 4-7 rings on metal, glass, ceramic, and plastic substrates were desorbed and ionized in air with a quadrupled Nd-YAG laser. Gaseous product ions were analyzed at ambient conditions in air directly using ion mobility spectrometry. Ablation rates for perylene on borosilicate glass were estimated as 0.01 ng/mm^2 per pulse and standard deviation for peak heights with roughly 1 μg/mm^2 was 34%. Substrate interference was avoided by using an unfocused laser beam at 0.5-1 mJ/pulse although gaseous ions also could be generated from substrates with a focused beam at 1 mJ/pulse.

37043 **Pressure programmed microbore column supercritical fluid chromatography-mass spectrometry for the determination of organophosphorus insecticides.** Kalinoski, H.T.; Smith, R.D. (Pacific Northwest Lab., Richland, WA (USA)). *Analytical Chemistry;* 60: No. 6, 529-535(15 Mar 1988). Contract AC06-76RL01830.

The use of the high flow rate (HFR) interface for supercritical fluid chromatography-mass spectrometry (SFC-MS) is shown to allow operation under conditions which provide efficient pressure programmed separations with appropriate microbore (packed) HPLC columns. The combined advantages of selectivity offered by the microparticle-packed stationary phase and variable solvating power of the supercritical fluid are fully utilized in this approach. The greater sample loadings and lower detection limits possible using packed columns (based on concentration of sample in the injection solvent) compared with commercially available capillary columns are demonstrated for the determination of a series of organophosphorus insecticides. Low concentrations of polar fluid modifiers, generally required for high-quality separations in packed-column SFC, also function as mild chemical ionization reagents. Broad classes of thermally labile, higher molecular weight, moderately polar pesticides are amenable to identification by SFC-MS, which provides a sensitive, selective, and broadly applicable technique for the identification of pesticide compounds with detection limits in the part-per-billion range.

37044 **Selective enhancement of room temperature phosphorescence using cyclodextrin-treated cellulose substrate.** Alak, A.M.; Vo-Dinh, T. (Oak Ridge National Lab., TN (USA)). *Analytical Chemistry;* 60: No. 6, 596-600(15 Mar 1988). Contract AC05-84OR21400;AC05-76OR00033.

The selective enhancement of room temperature phosphorescence (RTP) for a wide variety of polynuclear aromatic hydrocarbons (PNAs) on cyclodextrin-treated filter paper was investigated. Filter paper substrates were treated by simple impregnation in saturated solutions of α, β, and γ-cyclodextrins. The results show different RTP enhancement factors for PNAs depending on the type of cyclodextrin (CD) used and on the binding strength between the cyclodextrin and the PNAs. A two-component mixture of PNAs was analyzed by RTP and synchronous RTP in order to illustrate the improved sensitivity of the RTP technique and demonstrate the selective enhancement by cyclodextrin (SCED) methodology in multicomponent analysis.

37045 **Optical pH sensor based on the chemical modification of a porous polymer film.** Jones, T.P.; Porter, M.D. (Iowa State Univ., Ames (USA)). *Analytical Chemistry;* 60: No. 5, 404-406(1 Mar 1988). Contract W-7405-ENG-82.

A new approach to the design and construction of an optical pH sensor has been developed by immobilizing a direct azo dye at a porous cellulosic polymer film. This sensor was fabricated by binding Congo Red to a cellulose acetate film that had previously been subjected to an exhaustive base hydrolysis. Advantageous features of the design include (1) a rapid equilibration time (< 1.3 s), (2) a large dynamic range (> 4 pH units), and (3) ease of fabrication. The rapid response results from the porous structure of the polymeric support, which minimizes barriers to mass transport. The large dynamic range results from both the polyprotic acid-base reactivity of Congo Red and the large optical absorptivities of its various ionic forms. Furthermore, these results indicate that a variety of optical sensors which exhibit a rapid and sensitive response for the analysis of pH can be easily fabricated by immobilizing carefully selected direct dyes at porous polymeric substrates such as hydrolyzed cellulose acetate.

37046 **Self-cleaning, continuous cooling belt for low-temperature molecular luminescence spectrometry.** Jones, B.T.; Winefordner, J.D. (Univ. of Florida, Gainesville (USA)). *Analytical Chemistry;* 60: No. 5, 412-415(1 Mar 1988).

A device for rapidly cooling small amounts of sample to 15 K is described. The device employs a thin brass belt connected at the ends to form a loop. At one end, the loop is in contact with the cold stage of a closed-cycle helium refrigerator. Samples (50 μL) are injected through a septum in the vacuum chamber onto the cold portion of the belt. After the analysis, the belt carries the

sample away from the cold stage where it warms and evaporates. The cooling device is therefore self-cleaning. In this study, 11 polynuclear aromatic hydrocarbons (PAHs) dissolved in Shpol'skii solvents are determined by xenon arc excited low-temperature molecular luminescence spectrometry.

37047 **Capillary zone electrophoresis - mass spectrometry using an electrospray ionization interface.** Smith, R.D.; Olivares, J.A.; Nguyen, N.T.; Udseth, H.R. (Pacific Northwest Lab., Richland, WA (USA)). *Analytical Chemistry;* 60: No. 5, 436-441(1 Mar 1988). Contract AC06-76RL01830.

Instrumentation developed for capillary zone electrophoresis-mass spectrometry (CZE-MS) is described. The interface is based upon direct electrospray ionization from the end of the CZE capillary. The electrospray ionization source functions at atmospheric pressure and provides excellent sensitivity for wide ranges of compounds, with detection limits generally in the femtomole range (although significant improvements appear feasible). The instrumentation allows the high separation efficiencies feasible with CZE to be exploited and offers potential advantages compared with LC-MS methods, particularly when only small samples are available or high-resolution separations are necessary. The performance of the electrospray interface and the techniques and operating conditions for CZE-MS separations are described. CZEMS separations and mass spectra are shown for mixtures that include polypeptides and quaternary ammonium salts. Separation efficiencies and detection limits vary widely from compound to compound and are shown to be sensitive to buffer selection. Separation efficiencies exceeding half a million theoretical plates are demonstrated for some compounds. Wider application and improved performance are anticipated with minimization of CZE band spread (due to adsorption and possibly other processes) and optimization of CZE buffers (for both the separation and their compatibility with electrospray ionization).

37048 **Organics in water: solid phase extraction on a small scale.** Junk, G.A.; Richard, J.J. (Iowa State Univ., Ames (USA)). *Analytical Chemistry;* 60: No. 5, 451-454(1 Mar 1988). Contract W-7405-ENG-82.

Octadecyl (C-18) bonded to porous silica has been evaluated for the solid-phase extraction (SPE) of organic compounds from water. Excellent performance was deduced from average recovery of > 85% for pesticides and polycyclic organic materials present in contrived water samples at 1-10 ng/mL. Extraction results showed effective performance of the SPE when 1-100 mL of water was passed through small columns containing 40-100 mg of 40-μm C-18 bonded porous silica at flow rates as high as 250 bed volumes/min. The adsorbed compounds were removed by collecting 60-100 μL of either ethyl acetate or benzene eluate. The unique feature of this research is the combination of small water volumes, fast flow rates, small columns, and small eluate volumes that obviate solvent removals prior to GC analysis, while still retaining all the other advantageous features of SPE. Excellent performance was also confirmed in tests of environmental waters where the results based on SPE agreed with those based on accepted classical extractions.

37049 **Resonant Raman scattering as a source of increased background in synchrotron excited x-ray fluorescence.** Jaklevic, J.M.; Giauque, R.D.; Thompson, A.C. (Univ. of California, Berkeley (USA)). *Analytical Chemistry;* 60: No. 5, 482-484(1 Mar 1988). Contract AC03-76SF00098.

Experiments that study the optimization of tunable monochromatic synchrotron radiation for X-ray fluoreacence analysis have demonstrated the importance of resonant Raman X-ray scattering in establishing the minimum detectable limit for certain types of trace analysis. These analyses involve the measurement of elements with atomic numbers less than the predominant matrix elements in which the fluorescence of the matrix components is eliminated by selecting excitation energies immediately below major absorption edges. The cross section for Raman scattering from the matrix atoms can be resonantly enhanced resulting in a significant increase in continuum background below the fluorescence peaks of elements of interest. Significant increases in minimum detectable limits have been observed for gallium arsenide samples.

37050 **Performance of an improved monodisperse aerosol generation interface for liquid chromatography/mass spectrometry.** Winkler, P.C.; Perkins, D.D.; Williams, W.K.; Browner, R.F. (Georgia Institute of Technology, Atlanta (USA)). *Analytical Chemistry;* 60: No. 5, 489-493(1 Mar 1988).

An improved monodisperse aerosol generation interface for liquid chromatography/mass spectrometry interfacing (MAG-IC-LC/MS) is described. The interface has an aerodynamically superior momentum separator, which results in decreased analyte loss in passing through the interface. The interface is shown to perform well with a quadrupole mass spectrometer, in addition to earlier studies with a magnetic sector instrument. A new method of forming aerosol has been developed, which reduces the dead volume significantly over earlier designs. The performance of the interface has been evaluated by studying its capabilities for (1) generating electron impact spectra of searchable quality for selected compounds of interest, (2) operating with typical liquid chromatographic separation conditions, including reverse phase and gradient elution, and (3) providing low detection limits for both full scan and selective ion monitoring detection of a range of compounds. Studies include identification of the components of a mixture of cis and trans isomers of the thermally labile compound retinol (vitamin A) acetate. Full scan (m/z 80-350) electron impact spectra were readily obtained with 50-ng injection on-column. Detection limits for this compound were 10 ng full scan and 1 ng with selected ion monitoring. Identification of a free (nonderivatized) fatty acid mixture was also readily obtained, using a reversed-phase separation in gradient mode.

37051 **Wick evaporation: a technique for the isolation of soluble analytes from volatile solvents.** Chriswell, C.D.; Markuszewski, R. (Iowa State Univ., Ames (USA)). *Analytical Chemistry;* 60: No. 5, 508-509(1 Mar 1988). Contract W-7405-ENG-82.

Wick evaporation is a simple and effective specialized technique useful for recovering small amounts of soluble, nonvolatile analytes from volatile solvents. Despite its obvious utility, this wick evaporation technique, which has been used in their laboratory for over 10 years, has not been reported to their knowledge in the literature and appears to be unknown to most analysts. In past work at the Ames Laboratory, wick evaporation has been applied to the isolation of polyaromatic hydrocarbons from diethyl ether extracts of drinking water. The technique is likely to be applicable to similar applications in which small amounts of low-volatile analytes are isolated into volatile solvents. In the present work, the isolation of elemental sulfur from small samples of coal-derived humic-like materials is described as another example of the utility of this technique. In this application, wick evaporation serves both as a means for separating the soluble elemental sulfur from insoluble humic-like materials and as a means for concentrating the separated elemental sulfur in a small, accessible area on the wick tip.

37052 **Effects of dilution of poly(ethylvinylbenzene-divinylbenzene) adsorbent on the adsorption of aliphatic, alicyclic, and aromatic hydrocarbon adsorbates from effective zero to finite surface coverage.** Djordjevic, N.M.; Laub, R.J. (San Diego State Univ., CA (USA)). *Analytical Chemistry;* 60: No. 2, 124-130(15 Jan 1988).

The chromatographic measurement and systematic interpretation of the solidgas partition coefficients K/sub s/ and related thermodynamic properties of a number of hydrocarbon adsorbates (n-pentane through n-octane, cyclohexane, methylcyclohexane, benzene, dichloromethane, chloroform, carbon tetrachloride, tetrahydrofuran, thiophene, and acetone) at effective zero surface coverage with a 1:10 admixture of the title adsorbent-inert diluent from 393 to 443 K are reported. Despite a difference of an order of magnitude in the surface areas of bulk and admixed packings, the adsorbate relative retentions were in good agreement with those found in previous work with neat Porapak Q. The heats of adsorption also coincided to within an experimental error of ca. +- 5%. The GSC technique of elution by characteristic point was then used to derive the finite-concentration adsorption isotherms and isosteric heats of adsorption on n-hexane, cyclohexane, benzene, carbon tetrachloride, and acetone adsorbates with diluted Porapak Q over the tem-

perature range 393-433 K. All exhibited BET Type IV isotherms, as well as changes in the respective isotherm temperature coefficients. The latter is said to be a consequence of the microporous substructure of this adsorbent.

37053 **Gas adsorption on structurally heterogeneous microporous solids.** Jaroniec, M.; Madey, R. (Kent State Univ., OH (USA)). *Separation Science and Technology;* 22: No. 12, 2367-2380(Dec 1987).

Isotherm equations for gas adsorption on microporous adsorbents are derived for four distribution functions that characterize the structural heterogeneity of the solids. Since these functions represent the size distributions of micropores, they are physically meaningful for describing gas adsorption on heterogeneous microporous solids. Presentation of relationships between the distribution functions describing either structural or energetic heterogeneity of a solid increases the utility of previous distribution functions for characterization of microporous adsorbents.

37054 **Optimization of solvent composition for high performance thin-layer chromatography.** Bayne, C.K.; Ma, C.Y. (Computing and Telecommunications Div., Oak Ridge National Lab., Oak Ridge, TN (US)). *Journal of Liquid Chromatography;* 10: No. 16, 3529-3546(1987). Contract AC05-84OR21400.

The methodology of mixture experiments has been applied to optimize the multicomponent solvent composition for high performance thin-layer chromatography (HPTLC). In this study, a mixture of five solvents for the mobile phase was maximized for the separation of twelve structurally related B(a)P metabolites on normal phase HPTLC plates. Volume fractions (rather than absolute quantities) of the mobile phase solvents were constrained by upper bounds by considering solvent strength. These restrictions defined an experimental region that is an irregular polyhedron formed from a truncated 4-dimensional simplex. The optimization of the expected separation response over the experimental region was based on a second-order Scheffe polynomial estimated from twenty-five experimental runs. Six functions for measuring separation based on R/sub f/ values were evaluated. A new response function is proposed that overcomes the difficulties of previously published criteria.

37055 **Analysis of radioactive waste and glass for a defense waste solidification plant.** Coleman, C.J.; Baumann, E.W.; Bibler, N.E.; Dewberry, R.A.; Sturcken, E.F. (E. I. du Pont de Nemours and Co., Aiken, SC (USA)). pp 9-10 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC09-76SR00001.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Analytical methods have been developed and evaluated for supporting a high-level radioactive waste solidification plant. Radioactive defense waste from the Savannah River Plant will be combined with glass-making chemicals and melted at 1150°C to form borosilicate glass. This glass will then be placed in safe permanent disposal. Remote methods for dissolving and analyzing melter feed and glass containing actual radioactive waste were demonstrated in shielded cells. Microwave technology was used to dissolve samples and measure moisture content. A colorimetric method for measuring the Fe(II)/Fe(III) ratio in the glass was developed and demonstrated using a fiber optic-coupled spectrophotometer. Other methods for characterizing feed and glass samples include elemental analysis by ion chromatography, inductively coupled plasma-atomic emission spectroscopy, and atomic absorption spectrometry. Major radionuclides, ^{137}Cs, ^{90}Sr, and ^{238}Pu could be measured directly by counting techniques. Minor radionuclides such as ^{99}Tc required separation procedures prior to counting.

37056 **Automated fuel scanning system.** Robinson, L.; Dyer, F.F.; Hobbs, R. (Oak Ridge National Lab., TN (USA)). pp 10 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC05-84OR21400.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

In association with the high-enriched uranium (HEU) fuel to low-enriched uranium (LEU) fuel conversion program, an experimental technique has been developed at the Oak Ridge Research Reactor (ORR) which allows the study of the burn-up characteristics of an LEU fuel core. This 30-megawatt pressurized-water reactor will now serve as a source of freshly irradiated LEU fuel for study, and as a working example of the feasibility of the conversion. The fuel cycle at the ORR typically extends from 14 to 21 days. At the end of each cycle, individual fuel elements are analyzed non-destructively using gamma-ray spectroscopy. Due to the high radiation levels associated with each element, conventional laboratory techniques were inapplicable which necessitated the development of an automated and remotely controlled fuel scanning system. In this talk, the fuel scanning system will be described and information obtained using it regarding the burnup and power distribution in the ORR's core will be presented.

37057 **Optimization considerations in ICP-MS.** Parsons, M.L.; Bentley, G.E.; Hoard, D.J.; Coffelt, K.P. (Los Alamos National Lab., NM (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

Most studies involving the optimization of an ICP-MS have considered that the MS is independent from the ICP and have not included the possibility for interdependent behavior. In fact the flow rates at the sampling port as well as the ion flux should be important parameters in the ion focusing lens system at the input of the mass spectrometer. They have undertaken optimization experiments to evaluate the ICP-MS combination as a unit, utilizing both ICP parameters and MS parameters. The approach is to utilize the modified SIMPLEX procedure incorporating appropriate MS lens variables in addition to the conventional ICP variables. The response function studied was the ion current for selected isotopes of selected atomic ion species. Two atomic species were selected for these preliminary studies, one of high and one of low ionization energy. The discussion will focus on the interrelationships between the ICP and the MS parameters and the important parameters to use in optimization studies.

37058 **Development and applications of room temperature phosphorescence in chemical and biological analysis.** Vo-Dinh, T. (Oak Ridge National Lab., TN (USA)). pp 55 of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

The room temperature phosphorescence (RTP) technique is a simple and practical approach in phosphorescence analysis. Unlike conventional low-temperature phosphorimetry, the RTP technique does not require cryogenic equipment and low temperature refrigerant. For a number of years the RTP technique has been developed into a cost-effective and practical tool for screening chemical pollutants such as the poly-nuclear aromatic (PNA) compounds in complex mixtures. Recent results of this screening methodology applied to environmental analysis will be presented. Analyte-substrate interaction studies will also be discussed. They have also further developed the RTP technique for detecting biological systems. An example of biological applications is the detection of carcinogen-DNA adducts products by laser-induced RTP. The results indicate that the RTP technique provides a promising screening tool for monitoring human exposure to carcinogenic PNA compounds.

37059 **Serendipity, technology, and challenges towards better chemical instrumentation.** Yeung, E.S. (Iowa State Univ., Ames (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

Very often, the development of new or improved chemical instrumentation is influenced by factors other than the natural maturation of science. A fortuitous conversation about lipids led to their work on polarimetric detection in liquid chromatography. Advances became possible because of the availability of high quality laser optics, microbore columns, and high-frequency modulation techniques. The challenge of simplifying procedures for crude oil characterization led to the concept of quantitation without standards. In turn, that generated interest in further developments in indirect detection schemes. Instruments that do not normally respond to an analyte can still be used to detect it. The application of laser spectroscopy to chemical analysis has also benefited from new technologies such as frequency-stabilized lasers, high-power high-repetition lasers and acousto-optical beam deflectors. Recent examples from their laboratory will be presented.

37060 **Applications of line narrowing laser spectroscopies to biological systems.** Small, G.J.; Hayes, J.M.; Jankowiak, R.; Gillie, J.K.; Cooper, R.S.; Zamzow, D. (Iowa State Univ., Ames (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

Site excitation energy (isochromat) selective laser spectroscopies such as fluorescence line narrowing (FLN), photochemical and nonphotochemical hole burning (PHB, NPHB) have found wide ranging application from chemical carcinogenesis to photosynthesis to configurational tunneling in glasses at very low temperatures. A brief introduction to elementary principles is given by way of their most recent work on FLN analysis of DNA damage from carcinogenic PAH metabolites. For this problem, a detectability of 1 damaged base pair: 10^8 for $\sim$ 10 μg of DNA at a spectral resolution of $\sim$ 5 cm^{-1} is required. Progress towards this detection limit is reported. Novel results on the application of PHB and NPAB to photosynthetic antenna and reaction center protein complexes of photosynthetic bacteria (R. viridis, R. sphaeroides) and green plants (photosystem I) are reported. The high resolution hole spectra provide valuable information on excitation and electron transfer dynamics, electron-protein coupling and excited electronic state structure.

37061 **Resonance enhanced multiphoton ionization/fluorescence for the characterization of complex organic samples.** Weeks, S.J.; D'Silva, A.P. (Iowa State Univ., Ames (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

The characterization of complex organic samples utilizing a multi-dimensional instrument band on resonance enhanced multiphoton ionization (REMPI) will be described. The instrument combines: (1) high resolution chromatography (HRC); (2) tunable UV laser excitation/ionization; (3) time-of-flight mass spectrometry (TLFMS); (4) total electron current detection; and (5) laser induced fluorescence spectrometry. The selectivity of REMPI and the simultaneous detection of cations, electrons and photons allows for the unequivocal characterization of each eluant isolated from a complex mixture by high resolution chromatography. The applications of the technique will be documented from data obtained from the characterization of samples of environmental and biological origin.

37062 **Luminescence spectroscopy and its application to antibody-based fiberoptics sensor.** Vo-Dinh, T.; Tromberg, B.J.; Griffin, G.D.; Sepaniak, M.J.; Ambrose, K.R. (Oak Ridge National Lab., TN (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

The integration of fiberoptics technology and advanced optical sensor promises to open new horizons in medical, clinical and environmental monitoring applications. In the area of human health protection against environmental pollutants, there is a strong need for sensitive and selective instrumentation to analyze complex biological samples. This paper describes the principle and applications of immunofluorescence spectroscopy to the development of antibody-based fiberoptics sensors. Special focus is devoted to a new antibody-based fiberoptics biosensor recently developed to detect the important carcinogen benzo(a)pyrene (BaP). The fiberoptics sensor utilizes anti-BaP antibodies covalently bound to its tip. A helium cadmium laser was used as the excitation source to induce fluorescence from BaP conjugated to the bound anti-BaP antibodies. The fiberoptics device can detect 1 femtomole of BaP in a 5-μL sample drop.

37063 **Fiber optics-based time resolved fluorimetry for immunoassays.** Sepaniak, M.J.; Petrea, R.D.; Vo'Dinh, T. (Univ. of Tennessee, Knoxville (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

A number of fiber optic-based devices have been developed for bioanalyses, including probes for performing fluoroimmunoassays. Single-fiber probes possess the advantages of good signal collection efficiency and small size, but suffer from high optical background levels. Rare earth metal chelate fluorescent labels for immunoassays have extremely long lifetimes and permit the effective use of time resolved detection to reduce the optical background and, thereby, improve detectability. The instrumentation and methodologies associated with the use of fiber optics-based time resolved fluorimetry will be described. The limit of detection for Eu-2-naphthoyltrifluoroacetone is nearly three orders of magnitude lower than for the most common fluorescent label, fluorescein isothiocyanate. Commercially available Eu-chelate labeled reagents are used to demonstrate the potential utility of time resolved fluorimetry for fiber optics-based immunoassays.

37064 **Novel approach for spatially and temporally resolved mapping of transient events.** Yappert, M.C.; Yeung, E.S.; Kimbrell, S.M. (Univ. of Louisville, KY (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

A new two-dimensional mapping technique has been developed and applied to the study of laser generated plumes. Two acousto-optical deflectors, arranged in tandem, allow the scanning of a laser beam in orthogonal directions without mechanical movement. The ability to scan these deflectors very rapidly (10^5-10^6 Hz) allows the completion of a scan in periods as short as 50 μs, while providing a spatial resolution of 20 x 125 spots. For such a time frame it is possible to study the formation and decay of atomic or molecular populations generated by laser vaporization from a surface. Both Na atoms and Pb_2 dimers have been monitored by absorption over the lifetime of the plume. For the first time, frozen, two-dimensional images have been obtained at different times during the evolution of a single event.

37065 **Prediction of GC-FID response as a function of molecular structure.** Jorgensen, A.D.; Picel, K.C.; Vlastnik, V.J.; Stamoudis, V.C. (Allegheny College, Meadville, PA (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

The authors have been involved in the quantitative chromatographic characterization of complex mixtures, including synthetic fuels. Flame-ionization detector response factors are needed to relate detector signals to component concentration. For many years these factors have been predicted using rough guidelines based on molecular structure in lieu of analyzing individual standards. For example, each nitrogen or oxygen atom reduces the peak area by the equivalent of about one carbon atom. This work critically reexamines these guidelines using an internal standard and modern instrumentation, i.e. cold on-column injection into fused silica capillary columns. The results indicate that good predictions can be made in a reliable fashion. For the 72 compounds studied, most predicted relative response factors are within 2% of the observed value. This is a significant improvement over previous work and in many cases it can replace the need for the detailed analysis of standards. Classes studied include amines, nitrogen heterocycles, ketones, acetates, alcohols and phenols.

37066 **Nonaqueous sedimentation field-flow fractionation of inorganic particles.** Jones, H.K.; Robertson, D.M.; Yonker, C.R. (Pacific Northwest Lab., Richland, WA (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—). Contract AC06-76RL01830.

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

Characterization of inorganic particles by sedimentation field-flow fractionation (SdFFF) in organic carrier liquids offers an alternative to characterization in aqueous carriers. The densities of inorganic particles span a wide range (2 < rho/sub p/ < 10 gml). Ethanol (rho/sub s/ = 0.8 gml) and mixtures of ethanol and 1,1,2-trichlorotrifluoroethane (max. rho/sub s/ = 1.1 gml) were used in the analysis of silica particles by SdFFF. Organic liquids with densities as high as 3.0 gml could be exploited. Experimental studies with silica particles retained in a pure ethanol carrier gave results in good agreement with theoretical values. Another study with silica particles was performed in which the carrier liquid density was increased by stepwise addition of 1,1,2-trichlorotrifluoroethane to ethanol. The results show the feasibility of size and density characterization of inorganic particles in organic mixtures by SdFFF. The availability of high and low density miscible organic liquids makes carrier density programming a viable option along with the established programmed centrifugal field SdFFF.

37067 **Positron annihilation spectroscopy.** Dale, J.M.; Hulett, L.D. Jr.; Rosseel, T.M. (Oak Ridge National Lab., TN (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—). Contract AC05-84OR21400.

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

Positron annihilation spectroscopy (PAS) is a nondestructive technique that can be used for characterizing solid surfaces, defects in solids, or free volume in amorphous polymers. PAS is used in this work to investigate some positron annihilation characteristics of carbon fibers, epoxy polymers, and carbon-epoxy composites. They find that PAS is capable of detecting different concentrations of carbon fibers in composites. A relationship is shown to exist between fiber fractions found by PAS and apparent volume fractions found by density measurements. Positron annihilation centers have also been found that appear to have been created at the carbon-epoxy interface when the composite was prepared. Characterization of this interface is important for the development of composites with improved mechanical properties.

37068 **Colorimeter determination of Fe(II)/Fe(III) ratio in glass.** Baumann, E.W.; Coleman, C.J.; Karraker, D.G.; Scott, W.H. (E. I. du Pont de Nemours and Co., Aiken, SC (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—). Contract AC09-76SR00001.

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

A colorimetric method has been developed to determine the Fe(II)/Fe(III) ratio in glass containing nuclear waste. Fe(II) is stabilized with pentavalent vanadium during dissolution in sulfuric and hydrofluoric acids. The chromogen is FerroZine (Hach Chemical Company), which forms a magenta complex with Fe(II). The two-step color development consists of determining the Fe(II) by adding FerroZine, followed by determining total Fe after the Fe(III) present is reduced with ascorbic acid. The method was validated by analyzing mixtures of ferrous/ferric solutions and nonferrous glass frit, and by comparison with Moessbauer spectroscopy. The effect of gamma radiation was established. The procedure is generally applicable to nonradioactive materials such as minerals and other glasses.

37069 **(DP-tr—103) Studies on selective adsorption resins (12): Preparation of resins for adsorbing uranium in sea water.** Egawa, Hiroaki; Harada, Hiroshi; Nonaka, Takamasa. Translated from Nippon Kagaku Kaishi *Nippon Kagaku Kaishi ;* **11**: 1767-1772(1980). Contract AC09-76SR00001. 13p. Q/MF A01;1.

A study was perfomed with the aim of synthesizing resins for selectively adsorbing uranium for sea water. It was discovered that resins containing amidoxime groups (RNH), obtained by reacting acrylonitrile-divinylbenzene copolymer beads (RN) having a macroreticular (MR type) structure with hydroxylamine show good adsorbability of uranium in sea water. RN obtained by using 80–100 vol % toluene per monomer and 10–16 mol % divinylbenzene at the time of charging was found to be suitable as a substrate for obtaining resins with good uranium adsorbability; the copolymer beads had an average pore radius of 160–200 A, a specific surface area of 100–130 m^2/g, and a pore volume of about 0.4–0.7 ml/g. It was shown that RNH which was excellent for adsorbing uranium from sea water can be synthesized by adding a 3–5% methanol solution of hydroxylamine to RN at 1–1.5 moles per nitrile group and reacting at 60{degree}C for 3–5 hours or at 80{degree}C for 1–2 hours. 11 refs., 5 tabs.

37070 **(AEEW-R—2276) Dynamic light scattering studies of polymers in solution I: polyacrylamides.** Benson, C.G. (UKAEA Atomic Energy Establishment, Winfrith). Oct 1987. 31p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

Dynamic light scattering was used to investigate the behaviour of two grades of polyacrylamides both of different molecular weights (Alcoflood polyacrylamide 935 and 1175) dissolved in typical brine solution. Measurements were made initially at 90/sup 0/ scattering angle and the results used to provide a qualitative assessment of two methods of data analysis (ie method of cumulants and exponential sampling) which can be used to determine mean particle size. The semi-dilute regime is considered to be the range of concentrations in which interactions between polymer molecules become significant but without the formation of gel species. The semi-dilute behaviour of both polymers in the concentration range from 200 ppm to 1000 ppm was examined. The distribution mean particle size was measured for both polymers at different scattering angles in the range from 20/sup 0/ to 140/sup 0/. Diffusion coefficients for both polymers were measured over a range of different angles and concentrations. A study of the degradation of both polymers over a period of time showed the formation of large particulate species.

37071 (AEEW-R—2291) Dynamic light scattering studies of polymers in solution II: xanthan. Benson, C.G. (UKAEA Atomic Energy Establishment, Winfrith). Nov 1987. 15p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

Dynamic light scattering was used to study the behaviour of the polysaccharide, xanthan dissolved in typical brine solutions. Measurements were made at 90/sup 0/ scattering angle on a 200 ppm xanthan solution. The distribution mean particle size was found to be 110 nm using the exponential sample method of data analysis, the distribution being bimodal in form. A 600 pm microgel free solution also gave similar results suggesting that neither of the components of the distributions were due to microgels. A comparison was also made of method of cumulants and exponential sampling techniques of data analysis, both of which can be used to measure mean particle size. The exponential sampling method was found to give the most accurate results. The semi-dilute behaviour of xanthan was studied in the concentration range from 200 ppm to 4000 ppm. A significant dependence of distribution mean particle size on concentration was found in the range 400 ppm to 4000 ppm, suggesting that the value of the critical concentration was between 300 ppm and 400 ppm. When the individual components of each bimodal distribution were examined, it was found that the position of the maximum of the smaller component remained essentially constant, whereas that of the larger component increased with concentration.

37072 (AERE-R—12950) Swept frequency measurement and analysis of microwave reflections from solvent layers on a water surface. Plested, G.N.; Flemming, M.A.; Hellier, A.N. (UKAEA Harwell Lab. Instrumentation and Applied Physics Div.). Mar 1988. 26p. H.M. Stationery Office, London, price Pound 4.00.

Microwave reflections from a solvent layer floating on a water surface have been analysed and measured, for a range of solvent layer thicknesses. The benefits of making swept-frequency measurements using a vector network analyser have been demonstrated. The results show that by monitoring surface reflections close to the Brewster angle for water, a system can be produced that will measure solvent layers down to thicknesses of 0.1 mm.

37073 (CEGB-TPRD/B—1011/R87) Reanalysis of oxide solubility data: results for nickel oxide and magnetite. Thornton, E.W.; Walker, S.M. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Nov 1987. 55p. (PWR-CWG-P—88-539). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753607/JAW.

The analysis of oxide solubility data in high temperature water is discussed and attention drawn to (i) the need to use self-consistent sets of thermodynamic assumptions when intercomparing different studies and (ii) the importance of writing chemical equations involving ionic solution species in the correct manner (balancing like charges) if extrapolation to temperatures outside the range over which data were acquired is to be reliable. Literature solubility data for nickel oxide and magnetite are reanalysed, paying particular attention to uncertainties in the pH of minimum solubility and the magnitude and sign of the temperature coefficient of solubility at temperatures appropriate to the PWR primary circuit, around 300°C.

37074 (CONF-880435—7) Multiphoton ionization of transient species in supersonic jets. Miller, J.C.; Feigerle, C.S. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008366/JAW.

From 4. international symposium on resonance ionization spectroscopy and its applications; Gaithersburg, MD, USA (10 Apr 1988).

A series of experiments utilizing mass-resolved multiphoton ionization to study NO diluted into supersonic beams of rare gases is presented. The sensitivity of the technique is demonstrated by the detection of 10/sup 3)-10{sup 4/ molecules of the rare isotopic combination $^{15}N^{16}O$ in its natural abundance. New results are given on the spectroscopy and photophysics of the Ar-NO, Kr-NO, and Xe-NO van der Waals molecules present in the beam. Finally, the addition of an electron beam or glow discharge at the orifice of the supersonic nozzle results in the formation of metastable rare gas atoms, sputtered metal atoms, and vibrationally hot NO molecules. 18 refs., 4 figs.

37075 (CONF-880543—1) Theoretical studies of chemical reactions: dynamics. Wagner, A.F.; Davis, M.J.; Schatz, G.C.; Duchovic, R.J.; Steckler, R. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011994/JAW.

From Basic energy sciences combustion contractor's meeting; Lake Geneva, WI, USA (31 May 1988).

Theoretical studies have been performed on the dynamics of interesting chemical reactions. The systems studied included the recombination reaction of methyl radicals to form ethylene, the addition of hydrogen atoms to carbon monoxide and the thermal dissociation of the formyl radical, the reaction of two hydroxyl radicals to form water and atomic hydrogen, the reaction of atomic chlorine with hydrogen chloride, and the intramolecular dynamics of highly excited OCS.

37076 (CONF-8804117—2) The adherence of nickel oxide on nickel during high temperature oxidation. Liu, Yung Y.; Natesan, K. (Argonne National Lab., IL (USA)). Mar 1988. Contract W-31109-ENG-38. 12p. (CONF-8804117—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011194/JAW.

From Adhesion in solids; Reno, NV, USA (5 Apr 1988).

A combined experimental/analytical study is being conducted to investigate the fundamental nature of adherence of oxide scales formed on metals during high-temperature oxidation. Isothermal oxidation experiments were conducted on high-purity nickel (Ni 270) specimens in air at temperatures of up to 1200{degree}C. None of the experiments resulted in physical separation of nickel oxide scales from nickel substrate, even though substantial amounts of porosity were found in scales close to the scale/metal interfaces. The results of numerical and analytical calculations of stresses in the NiO/Ni system suggest that metal and oxide plasticities play a role in the experimental observations. 10 refs., 5 figs., 2 tabs.

37077 (CONF-8806137—1) Kinetics of iodine hydrolysis in unbuffered solutions. Palmer, D.A.; Lyons, L.J. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 11p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88011379/JAW.

From 2. C.S.N.I. workshop on iodine chemistry; Toronto, Canada (2 Jun 1988).

The kinetics of hydrolysis or disproportionation of hypoiodite were studied spectrophotometrically in basic solution at an ionic strength of 0.2 M as a function of pH, iodide and total iodine concentration, and temperature. The existence of three independent pathways for this second-order process was confirmed. The pH-stat method was used to monitor the corresponding reaction of hypoiodous acid in weakly alkaline solution. The generalized rate law for the disproportionation is: {minus}d([HOI] + [OI/sup {minus/}])dt = k /sub a/[HOI]^2 + k/sub b/[HOI] [OI/sup {minus/}] + k/sub c/[OI/sup {minus/}]^2 + k/sub d/[I_2OH/sup {minus/}] [OI/sup {minus/}]. The values of k/sub a/ and k/sub b/ are substantially smaller than previously reported. However, an unexplained contribution to the rate law resulting from the pH-stat measurements was also obtained. The rapid recombination of iodide and iodate in $HClO_4$ solutions was followed by stopped-flow spectrophotometry at three ionic strengths, and over a range of iodide and hydrogen ion concentrations, and at eight temperatures. Fifth-order kinetics were observed with no detectable induction period. 14 refs., 4 figs., 1 tab.

37078 (DOE/ER/04447—235) Raman and absorption spectrophotometric studies of selected lanthanide, californium-doped lanthanide, and actinide trihalides in the solid state. Wilmarth, W.R. (Tennessee Univ., Knoxville (USA)). Mar 1988. Contract AS05-76ER04447;AC05-84OR21400. 131p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88008234/JAW.

The solid-state absorption spectra of Cf(III) ions as a dopant in lanthanide trihalide hosts ($LnCl_3$: Ln = Ce, Sm, and Y; $LnBr_3$:

Ln = Ce, Sm, Tb, and Y; LnI_3: Ln = Ce and Y) have been recorded. The spectra of Cf(III) have been correlated with the various crystal structures. The phonon Raman spectra and solid-state absorption spectra of PmF_3, $PmCl_3$, $PmBr_3$, and two crystal modifications of PmI_3 have been recorded. Symmetry assignments have been made for the Raman-active bands for these trihalides and also the sesquioxide. The room-temperature absorption spectra have been correlated to crystal field effects. The symmetry assignments of the Raman-active phonon modes have been made based on polarized Raman spectra from single crystals of YF_3-type orthorhombic TbF_3 and $PuBr_3$-type orthorhombic $NdBr_3$. Raman spectra of other isostructural lanthanide compounds have been recorded and compared. Symmetry assignments for these compounds have been made by analogy to the single-crystal assignments. Raman spectra have been obtained and catalogued for a number of actinide compounds. Symmetry assignments have been made for the observed Raman-active phonon bands in this work based on the assignments made for isostructural lanthanide compounds. 29 figs., 22 tabs.

37079 **(DOE/ER/04447—237) Raman spectrometric studies of selected lanthanide tribromides and trichlorides.** Daniel, J.F. (Tennessee Univ., Knoxville (USA)). Mar 1988. Contract AS05-76ER04447;AC05-84OR21400. 77p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88008235/JAW.

Laser Raman spectroscopy was used to identify the crystal structures of lanthanide and actinide compounds. The phonon Raman spectrum is characteristic of the particular crystal structure. $GdCl_3$ exhibits two crystal structures, the UCl_3-type hexagonal and the $PuBr_3$-type orthorhombic. In the literature it is reported that the low temperature form is orthorhombic; results of experiments here suggest that it is hexagonal. Interconversion between these two forms can be accomplished with temperature andor pressure. In the present work laser Raman spectrometry was used to monitor crystal structure changes in $GdCl_3$ as a function of temperature or pressure to determine the temperature or pressure at which the hexagonal-to-orthorhombic transformation occurs. Raman spectroscopy was also used to determine the symmetry assignments for the Raman-active bands of a single crystal. Raman spectra of polycrystalline $NdBr_3$ have been recorded at room temperature and pressure and at approximately 100{degree}K. In addition, polarized Raman spectra of a single crystal $NdBr_3$ have been measured. Based on these polarization measurements, symmetry assignments of eight Raman-active modes were made. These assignments are useful in interpreting the phonon Raman spectrum of any compound exhibiting the $PuBr_3$-type orthorhombic structure. 24 figs., 5 tabs.

37080 **(DOE/ER/13406—3) Organometallic chemistry of heterobimetallic compounds: Final report for the period August 1, 1985-June 30, 1988.** Casey, C.P. (Wisconsin Univ., Madison (USA). Dept. of Chemistry). Mar 1988. Contract FG02-85ER13406. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011570/JAW.

Work is reported on the following: formyl compounds, cyclopentadienyl ring slippage, μ-hydrocarbyl diiron complexes, heterobimetallic compounds linked by heterodifunctional ligands, heterobimetallic dihydrides, reactions of heterobimetallic dihydrides, early-late transition metal bimetallic compounds, and heterobimetallic μ-alkylidene complexes. (DLC)

37081 **(DOE/ER/13617—2) Selective transformation of carbonyl ligands to organic molecules: Progress report for period September 1, 1987-August 31, 1988.** Cutler, A.R. (Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Chemistry). 1988. Contract FG02-86ER13617. 16p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009203/JAW.

We are interested in devising novel carbonylation procedures that convert alkyl complexes into their acyl derivatives. Alkyl complexes containing α-alkoxy or other oxy functionalities are especially of interest, since the alkyl-CO migratory-insertion step is central to converting synthesis gas to organic molecules with homogeneous catalysts. In our studies methoxymethyl complexes are used as model substrates. The presence of a methoxy group on methoxymethyl complexes kinetically retards their carbonylation. Our objective is to develop synthetic procedures that promote this reaction. Coordinated ligand reactions are also discussed. 20 refs.

37082 **(GKSS—87/E/41) RO-module with ultrasonic welded membranes.** Patocka, F.; Fries, S.; Timm, H. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.)). 1987. 9p. Special print from Desalination (1987) v. 64 p. 423-430.

A new RO-module (K-module) with ultrasonic welded membranes is presented. The text describes the K-module in operation, design, advantages and experience.

37083 (INIS-BR—1075, pp 10) **Phase transition in chromium and chromium-vanadium alloys.** Castro, E.P.; Marques, G.E.; Camargo, P.C. de. 1985. (In Portuguese). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702773/JAW. (CONF-8512148—).

37084 (INIS-mf—11227, pp 31-39) **Manufacture of cerium oxide-based polishing powders.** Janos, P.; Novak, J.; Broul, M.; Loucka, T. (Vyzkumny Ustav Anorganicke Chemie, Usti nad Labem (Czechoslovakia)). 15 May 1987. (In Czech). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702876/JAW. (CONF-8704300—).

From 2. conference on rare earths; Mikulov, Czechoslovakia (28 Apr 1987).

Briefly described is the preparation of hydroxides, oxalates, and carbonates of rare earth elements for the production of polishing powders. Discussed are the effects of praseodymium, a type of compound which decomposes in the heat, and the temperature during calcination, on the properties of polishing powders. These powders were manufactured in different ways and their properties were compared with imported powders. Their polishng properties were tested. (E.S.). 1 fig., 3 tabs., 15 refs.

37085 **(IPEN-Pub—122) Determination of separation factors of Tb and Yb in binary mixtures of extractants.** Favaro, D.I.T.; Atalla, L.T. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)). Sep 1987. 10p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702399/JAW.

The values obtained for the separation factors of Tb and Yb, in nitric medium, using binary mixtures of HDEHP(di-12-ethylhexyl) phosphoric acid, HTTA (thenoyltrifluoroacetone), TBP (tributylphosphate) and TOPO (tri-n-octylphosphine oxide) were calculated. It was observed, from the results obtained, that the separation factor between Tb and Yb is not improved by the presence of the second extractor, not even when the synergistic effect occurs.

37086 **(LA—11291-PR) Isotope and nuclear chemistry division. Annual report, FY 1987. Progress report, October 1986-September 1987.** Barr, D.W.; Heiken, J.H. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 289p. NTIS, PC A13/MF A01; 1; GPO Dep. Order Number DE88011880/JAW.

This report describes progress in the major research and development programs carried out in FY 1987 by the Isotope and Nuclear Chemistry Division. The report includes articles on radiochemical weapons diagnostics and research and development; other unclassified weapons research; stable and radioactive isotope production and separation; chemical biology and nuclear medicine; element and isotope transport and fixation; actinide and transition metal chemistry; structural chemistry, spectroscopy, and applications; nuclear structure and reactions; irradiation facilities; advanced concepts and technology; and atmospheric chemistry.

37087 **(LBL—25240) Tris[bis(trimethylsilyl)amido]uranium: Compounds with tri-, tetra-, and penta-valent uranium.** Stewart, J.L. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 200p. NTIS, PC A10. Order Number DE88010356/JAW.

This trivalent uranium compound, serves as a precursor to new tri-, tetra-, and penta-valent uranium species. The geometry about the U atom is pyramidal. Lewis-base coordination compounds of $U[N(SiMe_3)_2]_3$ with a one-to-one- ratio of Lewis base to

uranium were isolated with pyridine, 4-dimethylamino-pyridine, 2,6-Me_2-C_5H_3NC, and TPO. Two-to-one coordination compounds were obtained with t-butylnitrile and t-butylisocyanide. Compounds with more sterically demanding bases could not be isolated. The expected decrease in U-N($SiMe_3$)$_2$ bond length with increase in oxidation state is not observed. Reaction of ClU[N($SiMe_3$)$_2$]$_3$and Li[NH(p-tolyl)] yields the uranium (IV) dimer, U_2[N($SiMe_3$)$_2$]$_4$[μ-N(p-tolyl)]$_2$. Reaction with 2,4,6-triemethylaniline produces a dimer. Analogous substitution products could not be obtained with aniline or p-toluidine. t-Bu_3CO/sup {minus/}, t-Bu_3CHO/sup {minus/}, and t-Bu_3SiO/sup {minus/} are used to synthesize new tetravalent, mononuclear uranium compounds. Reaction of ClU(tritox)$_3$ with alkyllithium reagents leads to isolation of RU(tritox)$_3$. The reaction of U(ditox)$_4$ with MeLi affords the addition product U(ditox)$_4$(Me)Li, whose crystal structure is described. Preparation of uranium silox compounds is reported. 97 refs., 26 figs., 39 tabs.

37088 **(LBL—25330) Near-critical NaCl-H_2O: an equation of state and discussion of anomalous properties.** Pitzer, K.S.; Tanger, J.C. IV. (Lawrence Berkeley Lab., CA (USA)). May 1988. Contract AC03-76SF00098. 35p. (CONF-880606—2). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012029/JAW.

From 10. symposium on thermophysical properties; Gaithersburg, MD, USA (20 Jun 1988).

The system NaCl-H_2O near the critical point of pure water shows not only the remarkable properties of any two-component system near the critical point of one component but also an anomalous curvature of the T-x and P-x projections of the critical line in the range below mole fraction 0.0005. An equation of state is presented which is based on the Haar-Gallagher-Kell equation for pure water with a few terms involving the mole fraction of NaCl together with the temperature and density. Parameters in this equation were selected which yield a good representation of the entire vapor-liquid coexistence surface from 250 to 600°C and from the three-phase pressure to the critical pressure (or t the vapor pressure of pure water below its T/sub c/). Derivatives of this equation yield densities, enthalpies, and heat capacities which are compared with experimental data. Also, the properties calculated for the vapor near the three-phase line are compared with those predicted by the successive hydration model previously developed for NaCl in steam in equilibrium with solid NaCl. Other related topics are discussed, including the anomalous features noted above.

37089 **(NIIAR—14(725)) Investigation into the efficiency of vacuum-distillation cleaning of ditolylmethane coolant.** Rozhdestvenskaya, L.N.; Tebelev, L.G.; Romanova, Z.M.; Benderskaya, O.S.; Simonov, Yu.G.; Sidorov, V.V.; Pochechura, V.P. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1987. 20p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702950/JAW.

The efficiency in cleaning the ditolymethane reactor-coolant at the vacuum distillation units is shown. The diagrams of the units are presented and the choice of the distillation mode substantiated. The basic operations of the process are enumerated. It has been demonstrated that the above units meet the requirements of the reactor-coolant cleaning from the high-boiling thermoradiolysis products. Some additional and more efficient methods are needed for a complete removal of iron, chloride, oxygen-containing impurities out of ditolylmethane. 9 refs.; 8 figs.; 3 tabs.

37090 **(PNL-SA—15499) Rate expressions for abstraction of hydrogen atom from a molybdenum hydride by alkyl radicals.** Linehan, J.C.; Alnajjar, M.S.; Franz, J.A. (Pacific Northwest Lab., Richland, WA (USA)). Nov 1987. Contract AC06-76RL01830. 9p. (CONF-880604—11). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011897/JAW.

From Joint meeting of the 195th national meeting of the American Chemical Society and the 3rd Chemical Congress of North America; Toronto, Canada (5 Jun 1988).

Rate expressions were determined for the abstraction of hydrogen atom from pentamethylcyclopentadienyltricarbonyl-molybdenum hydride ($Me_5CpMo(CO)_3H$). The radical clocks hept-6-en-2-yl, produced from bromine atom abstraction from 7-bromoheptene, and hex-5-enyl, produced from bromine atom abstraction from 6-bromohexene, were utilized to compete intramolecular cyclization (kcyc) with bimolecular abstraction (kabs) from $Me_5CpMo(CO)_3H$ in n-octane. Using known rate expressions for the cyclization of the primary clock, and separate rate expressions for cyclization of the secondary clock to give cis- and trans-cyclized products, rate expressions for abstraction were developed from ratios of unrearranged and rearranged hydrocarbon products. For the primary clock, log(kabs/$M^{-1}s^{-1}$) = 9.0 +/- 0.3 - (0.93 +/- 0.2)/theta, theta = 2.3RT kcal/mole, kabs = 2.1 x 10^8 $M^{-1}s^{-1}$. For the secondary clock, log(kabs/$M^{-1}s^{-1}$) = 8.6 +/- 0.3 -(0.81 +/- 0.1)/theta, and kabs = 1.0 x 10^8 $M^{-1}s^{-1}$. The bimolecular rates are slower by a factor of ten than expected for diffusion control. The activation barriers are lower than activation barriers expected for diffusion-controlled hydrogen abstraction by ca. 1.5 kcal/mole. The results are discussed in terms of the thermochemistry of the reactions and in terms of rates of biomolecular reactions approaching diffusion control. The synthetic utility of the reduction reaction is discussed.

(CONF-8709266—).

From 6. workshop of the working party 2 "chemical and photochemical reactions" of the concerted action "physico-chemical behaviour of atmospheric pollutants"; Roskilde, Denmark (17 Sep 1987).

The rate of thermal decomposition of HNO_3 has been measured by FTIR spectroscopy. The measurements were made in a teflon lined batch reactor with a surface to volume ratio of 14 m^{-1}. The experiments were made with initial HNO_3 concentrations of between 2 and 12 ppm. At atmospheric pressure, HNO_3 decomposes into NO_2 and other products with a first order HNO_3 dependence and with a rate constant, describing the process in our equipment, of 2.1(+-0.3) 10^{-3} min^{-1}. There are strong indications that the decomposition proceeds heterogenously. 11 refs.

37099 **Vibration—rotation spectrum of the carbon dioxide—acetylene van der Waals complex in the 3 μ region.** Prichard, D.G.; Nandi, R.N.; Muenter, J.S.; Howard, B.J. (Department of Chemistry, University of Rochester, Rochester, New York 14627). *Journal of Chemical Physics;* **89**: No. 3, 1245-1250(1 Aug 1988).

The infrared absorption spectrum of the carbon dioxide—acetylene van der Waals complex has been observed in a pulsed molecular beam. A color center laser was used to excite the vibration associated with the antisymmetric hydrogen stretching mode of the acetylene monomer. The vibrational origin is 3281.740 cm^{-1} and the rotational constants are A" = 8876, B" = 2859, C" = 2155, A' = 8864, B' = 2855, and C' = 2154 MHz. The axes of the two monomer are parallel to one another and the complex has C_s/sub v/ symmetry. The separation of the monomer units is 3.285 A. The angular part of the intermolecular potential function is discussed in terms of electrostatic interactions between distributed multipole moments.

37100 **Fluorescence lifetime of excited cyclohexane in an argon matrix and in solid state cyclohexane at low temperature.** Preses, J.M. (Department of Chemistry, Brookhaven National Laboratory, Upton, New York 11973). *Journal of Chemical Physics;* **89**: No. 3, 1251-1254(1 Aug 1988).

Electronic fluorescence has been observed from cyclohexane isolated in an Ar matrix in the temperature range 16—30 K. Excitation spectra have been obtained, and the behavior of the fluorescence lifetime has been determined as a function of excitation wavelength. The variation of the fluorescence lifetime as a function of excitation wavelength in the matrix resembles that seen in the gas phase. The fluorescence of neat, solid cyclohexane has also been observed at low temperature, and its decay rate can be used to refine the parameters obtained near room temperature which describe the decay rate. The fluorescence lifetime (tau) of excited cyclohexane can be described by an expression of the form $1/tau = [4.1 \times 10^8 + 8.8 \times 10^{11} \exp(-4100/1.987\ T)]\ s^{-1}$.

37101 **Tunable far infrared laser spectroscopy of van der Waals bonds: Extended measurements on the lowest Σ bend of ArHCl.** Busarow, K.L.; Blake, G.A.; Laughlin, K.B.; Cohen, R.C.; Lee, Y.T.; Saykally, R.J. (Department of Chemistry and Materials and Chemical Sciences Division, University of California and Lawrence Berkeley Laboratories, Berkeley, California 94720). *Journal of Chemical Physics;* **89**: No. 3, 1268-1276(1 Aug 1988).

A tunable far infrared laser system has been used to measure the vibration—rotation spectrum of the lowest Σ bending state of ArHCl near 24 cm^{-1} in a cw planar jet operating with a terminal jet temperature near 3 K. Over 60 transitions have been observed for both ^{35}Cl and ^{37}Cl isotopes with resolution of the quadrupole hyperfine structure. An improved set of molecular parameters was determined, including B, D, H, and eqQ for both upper and lower states. Very narrow linewidths (approximately 300 kHz) resulting in high resolution and sensitivity make this technique a powerful new method for the detailed investigation of intermolecular forces.

37102 **Raman spectra of polycrystalline orthorhombic YF_3, SmF_3, HoF_3, YbF_3, and single crystal TbF_3.** Wilmarth, W.R.; Begun, G.M.; Nave, S.E.; Peterson, J.R. (Department of Chemistry, University of Tennessee, Knoxville, Tennessee 37996-1600). *Journal of Chemical Physics;* **89**: No. 2, 711-715(15 Jul 1988).

The Raman spectra of the orthorhombic form of polycrystalline YF_3, SmF_3, TbF_3, HoF_3, and YbF_3 have been recorded. Room-temperature, polarized Raman spectra of a single crystal of orthorhombic TbF_3 have also been obtained. Based on these polarized Raman spectra, symmetry assignments have been made for 23 of the expected 24 Raman active phonon vibrations in TbF_3. By analogy to the results from single crystal TbF_3, tentative symmetry assignments of the observed phonon vibrations were also made for the other compounds included in this work.

37103 **Metastable decay of photoionized niobium clusters: Clusters within a cluster?.** Cole, S.K.; Liu, K. (Chemistry Division, Argonne National Laboratory, Argonne, Illinois 60439). *Journal of Chemical Physics;* **89**: No. 2, 780-789(15 Jul 1988).

The photoinduced metastable ion fragmentation of niobium clusters has been found to closely correlate with the laser vaporization source conditions. The experimental evidence indicates the clusters agglomerate in the supersonic expansion. These agglomerated clusters exhibit rather unique behavior for a transition metal system. Both evaporation and fission fragmentation are observed. Two color MPI studies reveal the existence of long lived neutral intermediate states. Also, the kinetic energy release is extremely small, <10 meV, and independent of the excitation energy. The concept of clusters within a cluster, i.e., agglomerated clusters, is introduced to rationalize many experimental findings.

37104 **Autoionization dynamics in the valence-shell photoionization spectrum of CO.** Hardis, J.E.; Ferrett, T.A.; Southworth, S.H.; Parr, A.C.; Roy, P.; Dehmer, J.L.; Dehmer, P.M.; Chupka, W.A. (National Bureau of Standards, Gaithersburg, Maryland 20899). *Journal of Chemical Physics;* **89**: No. 2, 812-819(15 Jul 1988).

Autoionizing Rydberg series in the valence-shell spectrum of CO have been studied by determining the high resolution relative photoionization cross section of cooled CO in the energy region 14.0—20.0 eV and by determining the vibrational branching ratios and the photoelectron angular distributions for production of CO^+ $X\ ^2\Sigma^+$, $v^+ = 0$—2 in the energy region 16.75—18.75 eV. Of particular interest are three prominent spectral features between 17.0 and 17.5 eV that result from interactions involving Rydberg series converging to the excited A ^{2}Pi and B $^2\Sigma^+$ states of the ion. The results are discussed in the context of recent two-step multichannel

quantum defect theory calculations by Leyh and Raseev (the following paper).

37105 **Calculation of the rate of entropy production for a model chemical reaction.** Irvin, B.R.; Ross, J. (Department of Chemistry, Stanford University, Stanford, California 94305). *Journal of Chemical Physics;* **89**: No. 2, 1064-1066(15 Jul 1988).

The rate of entropy production due to chemical reaction is calculated for a variety of parameter values in the reversible Oregonator model. The average values over cycles of oscillation are compared to those in the coexisting stationary states. The present work corrects an earlier calculation [A. K. Dutt, J. Chem. Phys. 86, 3959 (1987)]. Contrary to previous impressions and claims, there is no consistent relationship between the magnitudes of the entropy production in coexisting stationary and oscillatory states, in this case.

37106 **Analytic treatment of percolation in simple fluids.** Xu, J.; Stell, G. (Department of Mechanical Engineering, State University of New York at Stony Brook, Stony Brook, New York 11794). *Journal of Chemical Physics;* **89**: No. 2, 1101-1111(15 Jul 1988).

The percolation behavior of simple fluids, modeled by a pair potential with a hard core and Yukawa tail, is studied by solving the connectedness Ornstein—Zernike equation analytically in the mean-spherical approximation for two different connectedness models. The simplest connectedness model is defined by a "connectedness shell" concentric to the sphere that defines the hard core. The analytical solution applies to the case of the shell width less than the hard-core diameter, which is the case for most applications of physical interest. The percolation loci on the phase diagram have been determined along with the average coordination number, which is found to be essentially constant along each locus, but different for different loci. A second model is introduced in which direct connectedness-in-probability is defined and applied to the gelation problem. This model can be thought of as a continuum generalization of the lattice model of gelation introduced by Coniglio, Stanley, and Klein. In the mean-spherical approximation, the models have percolation exponents ($\beta = 1/2$, $\delta = 5$, $\gamma = 2$, eta = 0, fractal dimensionality = 2.5) that for the most part are quite close to the best available estimates of these exponents.

37107 **Electronic structure of Cs multilayer and monolayer adsorbed on Ru(001): A photoemission study.** Sham, T.K.; Hrbek, J. (Department of Chemistry, Brookhaven National Laboratory, Upton, New York 11973). *Journal of Chemical Physics;* **89**: No. 2, 1188-1194(15 Jul 1988).

The electronic structure of Cs adsorbed on Ru(001) at multilayer and monolayer coverages has been investigated with high resolution photoelectron spectroscopy (PES) using synchrotron radiation. It is found that at multilayer coverage, the electron distribution curve (EDC) of the Cs overlayer is essentially the same as that of the Cs metal reported previously except that, with the high resolution, a surface atom core-level (Cs $^{5}p_{3/2}$) binding-energy shift of +0.24 eV is observed for the first time. It is also found that at monolayer coverage which exhibits a (78 x 78)-R30° LEED pattern, the Cs $5p_{3/2}$ level shifts by 1.0 eV to lower binding energy relative to that of the multilayer; this shift is accompanied by a significant linewidth broadening and a nearly complete suppression of O_3VV Auger emission. These results are interpreted on the basis of the volume effect and a rehybridization mechanism in which the compression of the Cs atom and the interplay of conduction and 5d electrons at the Cs site are crucial to the 5p binding energy shift, core hole lifetime, and Auger transition.

37108 **Microwave and infrared studies of acetylene dimer in a T-shaped configuration.** Prichard, D.G.; Nandi, R.N.; Muenter, J.S. (Department of Chemistry, University of Rochester, Rochester, New York 14627). *Journal of Chemical Physics;* **89**: No. 1, 115-123(1 Jul 1988).

Radio frequency, microwave, and infrared spectra have been obtained from molecular beams of acetylene dimer. The geometry of the isomer studied here is T shaped, with the centers of mass of the monomers separated by 4.38 A. The equilibrium structure appears not to have C_2/sub v/ symmetry and the vibrationally averaged structure has the "top" of the T rotated about its center of mass by 27°. The electric dipole moment of this complex is 0.28 D.

37109 **Systematic theoretical study of harmonic vibrational frequencies: The single and double excitation coupled cluster (CCSD) method.** Besler, B.H.; Scuseria, G.E.; Scheiner, A.C.; Schaefer H.F. III. (Department of Chemistry, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* **89**: No. 1, 360-366(1 Jul 1988).

Recently developed analytic CCSD gradient methods have been used to predictthe harmonic vibrational frequencies of six molecules: CH_4, NH^+_4,HCN, C_2H_2, HNC, and CO_2. In every case a double zeta plus polarization(DZ+P) basis set of size C,N,O(9s5p1d/4s2p1d), H(4s1p/2s1p) was used. Previous analogous studies of H_2O, H_2CO, and NH_3 are extended to form a statistical base of nine molecules. For these molecules 28 harmonic vibrational frequencies (out of total of 35 fundamentals) are thought to be known from experiment. The average errors with respect to experiment were found to be 9.1% (DZ+P self-consistent field), 3.7% (DZ+P configuration interaction including single and double excitations), and 2.2% (DZ+PCCSD). These statistics should provide guidance for the use of the CCSD method in situations where experimental vibrational frequencies are not available. Infrared intensities are also compared with available experimental data.

37110 **Unexpected hydrogen induced displacement of chemisorbed CO from the Ni(100) surface.** Shen, S.; Zaera, F.; Fischer, D.A.; Gland, J.L. (Chinese Academy of Science, Lanzhou Institute of Chemical Physics, Lanzhou, China). *Journal of Chemical Physics;* **89**: No. 1, 590-596(1 Jul 1988).

We report the first observation of hydrogen induced displacement of chemisorbed CO from the Ni (100) surface. This displacement is unexpected since the heat of adsorption for CO is 30 kcalmol, about 7 kcalmol larger than the 23 kcalmol heat of adsorption for hydrogen. These displacement studies were performed in a UHV system equipped with Auger electron spectroscopy and facilties for temperature programmed desorption. Rates of displacement were measured by integrating CO temperature programmed desorption spectra for a series of displacement times. Hydrogen pressures in the 10^{-5} to 10^{-4} Torr range cause displacement of chemisorbed CO in the 290 to 330 K temperature range in a matter of minutes. After displacement, the surface contained only undisplaced CO and adsorbed hydrogen. No surface contamination was detected following CO temperature programmed desorption. The displacement reaction is clearly positive order in CO coverage. The CO coverage data suggests two first order reaction regions with a decrease in rate with decreasing coverage. Displacement is about half-order in hydrogen pressure. For low CO coverages (below 0.3 to 0.4 monolayer) and 309 K the displacement probability is around 5×10^{-7} per incident H_2 molecule and has an activation energy of about 12 +- 1 kcalmol. At high coverages the displacement probability is about 1×10^{-6} per incident H_2 molecule and the activation energy decreases to about 8 +- 2 kcalmol. No CO displacement was observed in the 270 to 330 K temperature range for pressures up to 10^{-3} Torr of He, Ne, CH_4 or N_2. The CO displacement rate is also insensitive to deuterium substitution. The thermal activation energies measured indicate that the metal surface is furnishing 8 and 12 kcalmol for the displacement of high and low coverages of adsorbed CO, respectively.

37111 **Theoretical study of the energies of BH/sub n/ compounds.** Curtiss, L.A.; Pople, J.A. (Argonne National Laboratory, Chemical Technology Division/Materials Science Program, Argonne, Illinois 60439-4837). *Journal of Chemical Physics;* **89**: No. 1, 614-615(1 Jul 1988).

A study of the energies of BH/sub n/ compounds (n = 1—3), cations and neutrals, using high levels of ab initio molecular orbital theory, including correlation effects beyond fourth-order perturbation theory, is presented. The appearance potentials of BH^+, BH^+_2, and BH^+_3 are in good agreement with experiment. The results suggest that the experimental dissociation energy and ionization potential of BH may be in error.

37112 **2 + 1 REMPI spectra of cyclic ketones in a cold molecular beam. 2. The n → 3s Rydberg transition of methyl-substituted cyclohexanones and cyclopentanones.** Cornish, T.J.; Baer, T. (Univ. of North Carolina, Chapel Hill (USA)). *Journal of the American Chemical Society;* **110**: No. 10, 3099-3106(11 May 1988).

The two-photon excitation of the n → 3s Rydberg transition in monomethyl and dimethyl isomers of cyclohexanone and cyclopentanone has been studied by resonance enhanced multiphoton ionization (2 + 1 REMPI). This transition has been found to be highly sensitive to both the orientation and position of methyl substituents on the cyclic ketone ring. Cis and trans configurations of dimethyl isomers show characteristic 3s transition energy shifts which are additive in nature and can be used to predict the transition energy of other structures. The spectroscopic energies of configurational isomers appear to reflect relative ground-state stabilities. This correlation has been supported by thermodynamic data and molecular mechanics calculations of ground-state energies. Laser polarization effects are found to be useful in determining the degree of chromophore asymmetry in chiral molecules.
